Does history keep the name of Fox "on a different page and in a different category" from those of Pitt and Burke, because they were better Christians? Are the countrymen of Mill and of George Eliot likely to encourage their wives and children to believe the Christian faith, after they have decided (which it is quite true they have not yet) that they do not believe it themselves? In France, no doubt, that state of feeling has been common; but people have erred in taking it for more than a compromise adopted in a period of transition. And even in France men are learning to think it more manly to die without the Sacraments if they deliberately thought it right to live without them; while in England admirers of Heine were shocked at a biographer who tried to make out that, after all his brilliant mockery, he died in faith.

Without wishing to sneer at "the clerical mind," it is obvious that in things like these it will prove out of harmony with "the legal mind," to which these Temple Sermons may be supposed chiefly to be addressed. The clerical mind may be quite as good as the legal; each may be taken to be a mind of ordinary ability (Dr. Vaughan's ability, indeed, is far more than ordinary) and of more than ordinary education, but each warped, to some extent, by professional instincts and habits. The clerical bias may not lead a man further from absolute truth than that of any other profession; but nothing can be taught effectually or profitably if the teacher's mind and the learner's are permanently out of harmony. A man unable to harmonise them is *ipso facto* disqualified for teaching. The "Plea for Missions" is more hortatory and less argumentative than the companion volume, and so far better. It contains a very brief reply to Professor Müller's famous Lecture.

Lectures on the Doctrine of Justification. By John Henry Newman, sometime Fellow of Oriel College. Third Edition. (London: Rivingtons.) *Tracts Theological and Ecclesiastical.* By John Henry Newman, D.D., of the Oratory. (Pickering, 1874.) Dr. Newman, in the preface to this new edition of his *Lectures on Justification*, avows

that he holds "in substance in 1874 what he published in 1838," only (partly in the preface, partly in bracketed notes) he corrects expressions which he thinks inaccurate, or to do less than justice to Roman theology. One note of the latter class is suggestive and characteristic. He has spoken of "the charge against Romanism, not unfounded as regards its popular teaching, that it views the influences of grace, not as the operations of a living God, but as a something to bargain about . . ." On the words "popular teaching" he says: "It requires a considerable acquaintance with the working of the Catholic system to have a right thus to speak of it." Whether such an acquaintance has given him the right, or prevented his claiming it, we are left to guess. It is disappointing that Romans and Anglo-Romanists have not paid more honour to their greatest mind; but things like this suggest, that they are not very wrong if they suspect that his conscientious loyalty to the Church is not the same thing as hearty sympathy. The incongruity of the situation strikes the eye conspicuously in the other volume, where the critical tracts, reprinted at Rome, and in Latin, from his contributions to the Library of the Fathers, are subscribed with the "Nihil obstat," not only of three Italian theologians of more or less eminence, but of "Paulus Cullen, Censor Theol. Deputatus."

The "Theological Tracts" in this collection may be said to form a supplement to the author's early *History of the Arians*; indeed, the longest in the volume, "Cause of the Rise and Success of Arianism," written only two years ago, is avowedly intended to fill such a place. Theological treatises, in the sense usual thirty years ago, are not likely to find many other than Catholic, or at least orthodox readers; else there is a view to which non-Catholics might think the essay pointed: viz., that while the clear and consistent opinions of Arius were novel and shocking to the Christian world, those of the so-called Arians, or semi-Arians, were neither: that the opinions which, in a vague unsystematic form, were current through the Church generally, were as like the semi-Arian view as the Catholic; that at Alexandria, and there only (after the Apostles and "what may be called the Apostolic family"), there was a belief whose natural development was the Nicene faith; and that this view of a local school was finally impressed on the universal Church mainly by the strong character and genius of St. Athanasius, but partly also through the political circumstances that made him worth courting to the sons of Constantine. Of course this is not the impression Dr. Newman means to leave; but if he does leave it, can we blame less intelligent Catholics, who ask him "Call you this backing your friends?" The remarks on Novatian, again, and perhaps those on Tertullian, have a certain Anglican or at least English ring about them—they intimate a belief that in the personal party disputes of ecclesiastics, the right was not, even at Rome, always exclusively on the winning side.

The two last tracts in the volume are, we may presume, those called "ecclesiastical" in the title. The last, on "The History of the Text of the Rheims and Douay Version of the Holy Scripture," has some general interest. Archbishop Trench has half-educated most Englishmen into the belief that English and Irish Romanists are only allowed to read the Bible as veiled in the barbarous Latinisms of the sixteenth century; it will be good for them to know that for the last hundred years they have had a version which, while of course based upon the Vulgate, has in style and language been designedly approximated to the "Protestant" Bible, the only designed modification being the exclusion of archaisms.

But the "Ordo de Tempore" (*Anglicè*, Table of the Moveable Feasts), if worth sending to a magazine, was not worth reprinting. The subject is not treated historically, far less astronomically: we get only the sort of coincidences that a boy with a head

for figures puzzles out from the first pages of his Prayer Book while waiting in church for service to begin.

Catholic Thoughts on the Bible and Theology. By the late Frederic Myers, M.A., Perpetual Curate of St. John's, Keswick. "Present Day Papers," 5th series. (London: W. Isbister & Co.) There is an unintentional irony on the part of the editor or publisher in including Mr. Myers's book among "Present Day Papers." It was really remarkable that a clergyman should have written it in 1841, before the publication of Mr. Maurice's principal works; but

"Most can raise the flower now, for all have got the seed."

Appearing now, the book seems rather dull and very ordinary; but in 1848 (when it seems, from the postscript, that the author prepared it for publication) it would probably have commanded and deserved attention. This volume contains the third and fourth books of its author's so-called "Catholic Thoughts"—the epithet being used, not in the historical sense, but in what English liberal Christians wrongly suppose to be the etymological—the earlier books were apparently on *The Church of England* and *The Church of Christ*.

Holy Places: their Sanctity and Authenticity. By F. Philipin de Rivières, Priest of the Oratory of St. Philip Neri. With Maps. (R. Washbourne.) Part I. of this book, on "Local Sanctification and its Permanence," is full of a sober meditative beauty; and even its controversial parts are never chargeable with any sins against good taste or candour. Whatever one may think of the reasons or excuses alleged for spoliation and persecution of continental Catholics, one can hardly grudge them words of protest like these:—

"They know that, so far as the ordinary course of life is concerned, God is but a worm and no man—'vermis et non homo'; or, to quote the ancient law, term for a slave, 'non tam homo quam nullus'—less a man than a nonentity, which has no rights—something between a forgotten ancestor, a waiting heir, and an absent person unable to defend himself. They know that the defenders of sanctity ought to be lambs; and they will remember it at the right time, when they feel inclined to be wolves."

The reasonableness of veneration, on the part of the faithful, to the authentic Holy Places of their faith, if it needs any proof, receives such proof as it admits of when its champions show themselves the better for it. But when F. de Rivières comes, in his second part, to the question of the authenticity of the Holy Places now recognised in Palestine, he writes much more feebly. He has no knowledge of his subject at first hand, and can scarcely be said to have studied it profoundly. It takes no great acuteness to show that Mr. Ferguson's theory of tradition being falsified since Constantine is a startling paradox, or that St. Macarius's personal character is an objection to the view that the invention of the Cross was a concerted imposture. The strongest arguments, though in least compass (and even these are not original), are devoted to the case where *a priori* difficulties are greatest—that of the Holy House at Loretto. The only conspicuous merit of this part is the candid and manly refusal to maintain a *cultus* as edifying while yet abandoning the authenticity of the facts it rests on. Protestants may, if they like, have the satisfaction of triumphing over some curious blunders in references to the Old Testament (pp. 207 n., 220.) And the author should have known that they will not admit St. Jerome's gloss on Isa. xi. 10 as the prophet's meaning.

Sayings ascribed to our Lord by the Fathers and other Primitive Writers, and Incidents in His Life narrated by them, otherwise than found in Scripture. By John Theodore Dodd, B.A., late Junior Student of Christ Church. (James Parker & Co.) Mr. Dodd has studied a very interesting subject, and is much the wiser for it; but he has hardly made his readers so. The collection of passages

is not quite exhaustive, nor is it very lucidly arranged. And without more discussion than the size of this book gives room for, it is impossible to judge what the evidence adduced is worth. Hypotheses that we cannot verify ought not to be mistaken for discoveries; but they may be useful as frames for the colligation of facts—it may even be impossible to make facts intelligible without them.

EDITOR.

NOTES AND NEWS.

PROFESSOR STERN has met with a MS. volume preserved in the Archives of Bern, containing letters of the English Republicans who took refuge in Switzerland after the Restoration. These men resided at Vevey, and corresponded with a certain Dr. Hummel, at Bern, a celebrated theologian of the time, who had previously visited England. There is a series of letters written to him by Daniel Pennington and Elizabeth his wife. He was also in correspondence with Gataker, and with John Dury. The English republicans at Vevey seem to have assumed pseudonyms. One letter is from "William Cawley, but since I left my native soyle W. Johnson." Another from "Edm. Philippe, al: Ludlowe."

DR. MORRIS'S *Elementary Lessons in Historical English Grammar* is just ready, and we are glad to hear that it will be published at half-a-crown, so as to ensure its use largely in schools.

MR. SKERT is adding a large body of notes and a complete glossary to his forthcoming further selection from Chaucer's *Canterbury Tales* for the Clarendon Press Series. His edition of the Four-Text Gospel of St. Luke for the Syndics of the Cambridge University Press is also far advanced.

MESSRS. G. BELL AND SONS are preparing new editions of the late Mr. Fairholt's *History of Costume in England*, and of Mr. Planché's little work on the same subject, *History of British Costume*.

AT Dr. Richard Morris's suggestion, application has been made to the Master of the Rolls, by the Director of the Early English Text Society, for the copy taken by Government order of the Anglo-Saxon Homilies in the famous Vercelli MS., in order that they may be edited for the Early English Text Society. Mr. Kemble, when re-editing the "Solomon and Saturn," and other poems, &c., from the Vercelli MS. for the Ælfrie Society, did not print the Homilies.

THE Early English Text Society's prizes for a knowledge of English before A.D. 1400, have been adjudged in three colleges:—I. Queen's College, Cork, to, 1. W. H. Corker; 2. T. Harrington and E. S. Donovan (Professor Armstrong, examiner); II. St. John's College, Annapolis, Maryland, to Keating S. Nelson, junr., of Culpeper county, Virginia (Professor Garnett, examiner); III. Baltimore City College, to W. M. Hackett (Professor Shepherd, examiner). A grant of the last three years issues of the Society's publications has been made to Professor Bartsch, of Heidelberg, for his new Seminary for the study of Modern Languages.

DR. J. H. LLOYD, of Dublin, has in the press a work on "The Idioms of the German Language."

THE Italian papers announce that Signor Samaritani has discovered the true key to the Etruscan inscriptions. This time it is to be Hebrew, an old rusty key, which was tried in the sixteenth century by Giambullari, and has since been tried by others, but hitherto with no more success than the Turanian and Aryan keys.

THE American papers state that Mr. Bayard Taylor, while travelling in Egypt, has been able to get possession of all the love-letters which passed between Joseph and Potiphar's wife. It is easy to see how this rumour may have arisen, viz., from certain resemblances to the story of Joseph in the Egyptian novel, first translated by

De Rougé. Anyhow, we fear the enterprising editors of the American papers will be disappointed.

MESSRS. BICKERS AND SON have in the press a new edition (the fifth) of Chaffers' *Hall Marks on Gold and Silver Plate*, with Tables of Date Letters used in all the Assay Offices of the United Kingdom, and much additional information. This edition contains a history of the Goldsmith's Trade in France, with extracts from the Decrees relating thereto, and engravings of the standard and other marks used in that country, as well as in other foreign States.

MR. ROACH SMITH'S *Rural Life of Shakspeare* is to be republished by Messrs. George Bell and Sons, with large additions. We hope Mr. Smith will note, as much as possible, the chronology of Shakspeare's use of country terms and similes. The prevalence of them in his earliest work, the *Venus and Adonis*, when he had just left Stratford, and in his latest, *Winter's Tale*, after he had retired for good to his native town, is most striking. In the *Venus* it is not only the well-known descriptions of the horse (l. 260-318), and the hare-hunt (l. 673-708), that show the Stratford man, but the touches of the overflowing Avon (l. 72), the two silver doves (l. 366), the milch doe and fawn in some brake in Charlecote Park (l. 875-6), the red morn (l. 453), of which the weatherwise say—

"A red sky at night is a shepherd's delight,
A red sky at morning 's a shepherd's warning,"

the hush of the wind before it rains (l. 458), the many clouds consulting for foul weather (l. 972), the night owl (l. 531), the lark (l. 853), &c., &c., just as the artist (l. 289), and the shrill-tongued tapsters (l. 849), show the taste of London life. The early *Love's Labours Lost* and *Midsummer Night's Dream* are full of country touches too. In the late *Winter's Tale*, as in *The Tempest*, not only does the newtype of country maiden come into Shakspeare's plays, but country pursuits and flowers, the latter being named in the order in which they lived again in spring, and as Shakspeare saw them in Stratford woods and meads, daffodils that come before the swallow dars, violets and prim-roses, and then again in the late *Cymbeline*, prim-rose, harebell, eglantine (wild rose).

MESSRS. VIRTUE AND CO. have now completed three of the four imperial quarto volumes of which their "Imperial Shakspeare" is to consist. It contains Charles Knight's latest text and notes, and a series of steel engravings, ten inches by eight, from pictures by Stanfield, Cope, Frith, Maclise, Ward, Marks, Orchardson, Clint, &c. The publishers claim that their book is the Boydell's edition of the day, in a handier form, and with pictures not done to order, but spontaneously produced by the artists.

MR. JAMES WALTER is preparing a second and cheaper edition of his privately-printed three-guinea quarto, *Shakspeare's Home and Rural Life*, with its more than a hundred views of Stratford and its neighbourhood.

THE United States Committee for raising funds for the Curtius Foundation consists of Professors W. D. Whitney, Yale College, New Haven, Connecticut; J. C. Van Benschoten, Wesleyan University, Middletown, Connecticut; F. D. Allen, Harvard College, Cambridge, Massachusetts; T. D. Seymour, Western Reserve College, Hudson, Ohio; and J. M. Garnett, St. John's College, Annapolis, Maryland. The members hope to raise a liberal sum towards the scholarships and prizes to commemorate the twenty-fifth anniversary, on October 26 next, of Curtius's entrance on his work as a Professor at Leipzig. We fear the English contribution is likely to be small. Comparative Philology is not much in request, or held in much honour, here.

THE *Scottish Guardian* of last week announces that the *Christian Remembrancer* is shortly to be revived under the title of the *Church Quarterly*.

The editor will be the Rev. J. G. Cazenove, D.D., who has just resigned the Provostship of Cumber College.

THE Icelandic Thousand Years' Feast was celebrated by the Icelanders in Copenhagen with shut doors. At first none of their proceedings were published by the Danish papers, not unjustly offended at such inappropriate exclusiveness. But the songs sung on the occasion have now been published, and they prove to be of more literary worth than anything the festival has yet produced. They are composed by the Icelandic poet Gisli Brynjúlfson.

ON August 7, which was J. N. Madvig's seventieth birthday, a bronze statue of the great scholar, modelled after a design by Bissen, was unveiled in the little town of Svaneke, in Bornholm, where he was born.

M. ST. JOSEPH SENICCI has published an account of the Warsaw University collection of books published by the famous printers of the Elzevir family, including the Theses printed by Abraham Elzevir, the works falsely attributed to them, and those issued by them with fictitious imprints. M. Senicci's work is in French, and has been favourably spoken of by the *Rivista Europea*.

THE *Svensk Tidskrift för Literatur, Politik och Ekonomi*, pursuing its favourite course of being two months behindhand, has just appeared for June. It is unusually full of interesting matter. Professor Lysander gives a careful and sympathetic study of Max Müller's "Introduction to the Science of Religion" and the lecture "On Missions." The Swedish critic views the subject in a wide light, and forbears to enter into details which, as he says, "the reader will soon be able to follow in the author's own clear and fascinating style," the reference being to a translation of Max Müller's works announced for this autumn by a Stockholm publisher, and to be edited by Docent Fehr. Lysander objects, as an English critic has lately done, to the classification which includes Brahminism among non-missionary religions. The *Tidskrift* also contains an interesting literary study on the aesthetic value of the contest between Thorild on the one hand, and Kellgren and Leopold on the other, a piece of poetical polemics that enlivened Swedish literary history exceedingly during the last years of the eighteenth century, but which had, after all, not much effect on the progress of poetry. The rising power of Romanticism, headed in Sweden by Atterbom, was equally destructive to the fame of Thorild and Leopold, and the interest of their frantic battles is now purely critical and historic. Herr Djurklou reviews a remarkable tragic drama of the seventeenth century, a MS. of which has been recently discovered, and the printing of which adds Isaac Börk to the list of Swedish poets. It will be seen that the *Tidskrift* is unusually full of literary matter.

THE Faroe Islands distinguished themselves during the King of Denmark's visit by an almost frantic display of patriotism mingled with local pride. The King was addressed in the Faroese language by one enthusiastic gentleman, but the municipality generally confined itself to the singing of songs by the local poet set to old Faroese airs. The language is an independent branch of the Icelandic or Old-Norse stock, and is said to present great difficulties to the learner, difficulties that are aggravated by the fact that no books exist in it.

THE first proposal for the introduction of a phonetic alphabet of the English language is generally attributed to Dr. Franklin, who in 1768 put forth a treatise in which he recommended the adoption of certain additional symbols expressive of sounds not adequately represented by any letters now in use, or by combinations of them. Nearly a century earlier, however, a petition was presented to Charles II., which shows the worthy American

philosopher's idea to have been by no means a novel one. This petition, which is preserved amongst the State Papers, we give here at length:—

"The humble petition of Peter Chamberlen M.D. yo^r Ma^{ty} First, & Eldest Physitian in Ordinary to yo^r Royal Person.

"Humbly sheweth

"That the Law having provided 14 Yeares for the sole Benefit of the Author of every New Invention: yo^r pet^r having invented a New way of Writing & Printing True English; whereby to Represent to the Eye what the Sound does to the Eare. An Art much wanted: Innocent to All, wellpleasing to the Learned, Profitable to the Unlearned & to Strangers, and not a little to the Honor of the Nation.

"May yo^r Ma^{ty} be graciously pleased to graunt to yo^r pet^r & his Assignes, yo^r Ma^{ty} Letters Patents, under yo^r Ma^{ty} Broad Seal of England, for their sole Licencing & Publishing all Books or Writings, which shall be so written or Printed. With Prohibition to All others; not to Buy, nor Sell any unlicenced during the said space of 14 yeares, &c."

ON Aug. 5, 1672, the king referred this petition to the consideration of Sir Francis North, the Solicitor-General, who thus reports on October 14:—

"I have considered of the petition & discoursed with yo^r pet^r and finde that he hath bestowed much paines & study in Amending the Orthography of the English Tongue by devising new letters & confining the use of the knowne letters to one particular sound and reiecting such as are useless, w^{ch} worke may be of excellent use. And I doe humbly conceive yo^r Ma^{ty} may fittly gratify the Pet^r for his encouragem^t herein with a Grant of the sole priviledge of yo^r same for the Terme of fourteen yeares," &c.

We cannot find that Dr. Chamberlen published any works explanatory of his system. There are, however, a few other new and curious facts brought to light about him in the State Papers. In reply to his petition shortly after the Restoration, the king, having declared him the only surviving physician of his father and mother, and an attendant on his own happy birth, appoints him first physician in ordinary. The doctor seems to have directed the inventive powers of his mind towards other channels besides the reformation of English spelling, for in 1665 he applies for a special patent for the sole making of coaches, waggons, carts, ploughs, &c., to go without horses, such as he had seen in Augsburg fifty years before; and about the same time he wants a patent, "similar to those granted him in France, Venice, and the United Netherlands, for his new invention of navigating with all winds in a straight line." In this latter application Chamberlen describes himself as eldest fellow of the College of Surgeons, and attaches to it a so-called vindication of himself from the accusations of his enemies, showing that he is not, as reported, "non inventus," but may be found at his lodging, Garlick Hill, near Bow Lane. Numerous volumes from the doctor's pen may be consulted by the curious in the library of the British Museum. We append the titles of two or three of them as samples: *A voice in Rhama: or the crie of Women & Children Echord forth in the compassions of Peter Chamberlen, 1647; A vindication of publick artificiall Baths, &c., 1648; The Poore Man's Advocate, or England's Samaritan pouring oyle and wine into the wounds of the nation by making present provision for the souldier and the poor, &c., 1679.*

A FEW weeks ago we inserted a short extract from a Coventry newsletter, illustrative of "old country credulity" two centuries ago. Another extract, dated November 2, 1672, from the same source, has been sent to us for publication, which tells a yet more wonderful story:—

"All our wonder here about is employ'd at the strange condition of a maid neare us, one Elizabeth Tibbotts of about 18 yeares of age living wth her unkle one Thomas Crofts at a place call'd Hust (?) in yo^r parish of Stonely (Stoneleigh) about two miles hence. Yo^r maid for about this 3 weekes past has bene taken with strange fits in w^{ch} shee has vomitted up severall things incredible, as first severall Pebble stones neare as big as eggs, knives, sissers, peices of glass some of

them two or 3 Inches square, peices of Iron, an Iron Bullet of at least 8 Inches round and 2 pound & halfe weight, a black drinking pot of neare halfe a pint, peices of cloth & wood, a pockett pistoll, a paire of Pincers, Bottoms of yarne and severall other things many whereof are now at our majors, and have bene evidently seene to come out at her mouth, by many credible witnesses, nor should I my selfe venture to give you this Relation, w^{ch} seemes soe unlike truth, had I not my selfe bene an eye witness, wth my most cunning observation of soe much of it, that I am confirmed in y^r beleife of the whole, all w^{ch} is imputed to some diabollicall practices of one Watson a strang kind of an Emperick to whom shee was some tyme a Patient, who had it seemes soe wrought wth her as that shee had promis'd him marriage, & to goe wth him (though shee knew not whither) But afterwards refused it. Immediately upon w^{ch} shee fell into these fitts, yet has shee her respites during w^{ch} shee appeares reasonable well, & I have heard her discourse very rationally of her selfe & condition, a full account whereof would be too long to give; 'tis said that for these 4 or 5 dayes past (in w^{ch} tyme I have not seene her) somewt appeares to her in y^r shape of a dogg. Now, whether shee be bewitcht or whether shee be a witch, or whether y^r Divell be in her, as well as some others of her sex, I know not, but that what I have told you seemed to y^r most vigilant eye to be infallibly true is not doubted, so that if it be not really soe, I can only say the Divell's in't, who you perhaps may fancy to be in him that gives you this seemingly incredible Relation, w^{ch} be pleased to accept for better, for worse from," &c.

THE new number of the *Revista de Archivos, Bibliotecas, y Museos* contains, among other articles, a continuation of Señor Codera's essay on the Arabic Numismatics of Spain; Documents on a painting of Jesus praying in the Desert, attributed to Correggio; and a notice of a book which calls for a passing word. "La familia de los Biblos, hojas sueltas de un libro sin principios ni fines, dedicadas al Sr D. Francisco Cutanda, de la Academia Española, Antonio Martín Gamero, correspondiente de la misma y de la Historia, etc. Toledo—Imprenta de Fando & hijo," 1870, 8vo. 8pp., is a book of which only a few copies were printed, and those not for sale, and deals in a humorous fashion with the vocabulary and *argot* of book-collecting. The transformation of the *bibliófilo* into the *bibliomaniático*, or *bibliófobo*, is not uncommon. The last-named is a dangerous animal, not, as one might expect from the name, with a repulsion for books, but with a passion for their possession and annotation. That in regard to books there is no such thing as conscience is the creed of the *bibliopirata*, who is the terror of the true *bibliófilo*. We have here a word for which an equivalent is needed in our tongue. That the *bibliopirata* exists amongst us let the mutilated books in the British Museum bear witness. Nor are we without specimens of the *bibliófila*, who judges by print and binding, calls all old books ugly, and sells for a trifle those which he has inherited from his ancestors. One of these creatures who has come into possession of the library of his uncle the canon, is an object to be coveted by a *bibliófilo*, who, in exchange for novels and *illustrated* books, may acquire precious tomes yellow with age.

MESSRS. HACHETTE have just published the first two *livraisons* of the fourth volume of M. Guizot's *History of France*. We are glad to learn that the health of the illustrious historian continues to improve.

THOSE who are interested in what we may term the romance of "blue blood," will find ample opportunities of gratifying their taste in a series of papers "On the History of Royal and Noble Families, belonging especially to Germany," by Arthur Klein-Schmidt, which have lately appeared in the well-known German monthly periodical *Unsere Zeit*. With something like republican contempt for the privileges of rank and the prestige of birth, the author tracks with unerring

aim every royal and ennobled family in Germany back to its sources, laying bare by the way every blemish in the line of descent, and pausing at every point where a morganatic marriage or other plebeian union crossed the pure blue stream with blood of inferior quality. After following the apparently endless ramifications of his network of family history, in the course of which we are perpetually being brought in contact with the ghosts of long departed joys and sorrows, we find ourselves compelled to adopt the author's opinion that the members of the ancient noblesse are as thoroughly fallen from their high estate as their strongholds have fallen into decay, and that not even the most imaginative of day-dreamers could dare to rehabilitate the fading shadows of their power.

THE Committee which has been considering on what conditions the French Archives may be thrown open to the investigations of scholars has just issued its report. The archives will be open from midday to 4 p.m., to students who have obtained the necessary authorisation, for the following periods:—(1) from the most ancient times to the Treaty of Utrecht; extracts and copies may be made without being submitted to the authorities; (2) from the Treaty of Utrecht to the end of the reign of Louis XV.; any extracts or copies must be submitted to the approval of the director. Permission to consult documents relating to a later period can only be obtained in exceptional cases, and under special conditions. No collection of letters, or series of documents or despatches may be copied in its entirety with a view to publication, without the express consent of the authorities being first obtained. The Department of Foreign Affairs is to contribute, as heretofore, to the collection of *Unpublished Documents on the History of France*. Every diplomatic and consular agent will be required, on the expiration of his functions, to leave in the archives of the embassy, legation, or consulate, all correspondence and other documents which have accumulated during his mission; while it is stipulated that after the death of any diplomatic agent, all papers concerning the service of the State shall be restored by his heirs to the Ministry of Foreign Affairs.

THE *Journal de Saint Pétersbourg* states that the inauguration of the new buildings of the chief Archives of the Foreign Office at Moscow took place July 22 (? August 3). In these archives are preserved the documents relating to the diplomatic history of the Empire during the present and the last centuries. The old house was falling into ruins; it was too small and very damp, and continuous study there was out of the question. An old mansion of the Romanow period, belonging to the Ministry of Finance, has been acquired by the Ministry of Foreign Affairs, and rebuilt, together with a church which formerly belonged to it, in the Romanow style, for the purpose of storing the diplomatic documents of past ages, and of facilitating access to the archives for scholars who wish to consult them. Special arrangements have been made for the latter purpose, and a large library will also be henceforth open to the public. The architect was M. de Reimers.

THE Universities of Halle and Leipzig have both sustained a heavy loss in the course of last week by the death of Drs. Anschütz and Ahrens, the former having held the chair of Jurisprudence at Halle since 1862; and the latter having for many years been Professor of Political Economy and Sociology at Leipzig, where his classes always attracted a large number of students. Dr. Ahrens, who died at the age of sixty-six, was well known at Brussels and Paris by the admirable courses of lectures on Psychology and Philosophy which he had given during his residence there, when, in consequence of his participation in the Göttingen disturbances of 1831, he had found himself under the necessity of fleeing from Germany. It was during his temporary occupancy of a chair of

Philosophy at the University of Brussels in 1834 that he published his *Cours de Psychologie* and his *Cours du Droit Naturel*. He was also the author of *Die Organische Staatslehre*, *Philosophie des Rechts*, *Die Juristische Encyclopädie*, and other works of a similar character.

NOTES OF TRAVEL.

THE *Golos* states that during the year 1873 the total mileage of Russian railways increased from 13,217 to 15,191 versts, or in the ratio of about 15 per cent., the new branches being confined to the basins of the Dnieper, the Vistula and the Duna, in the south-west portion of the Empire. Out of the forty-five different lines, one alone, the Livny (length 57 versts), is a State railway, all the others being the property of companies. The number of passengers conveyed in 1873 amounted to 22,800,000, showing an increase of about 11 per cent. over the previous year's numbers, and the gross receipts were 122,877,000 roubles, or upwards of 20 per cent. over those of 1872.

M. PERTUISSET, who was recently commissioned by the Chilean Government to explore the group of islands composing the Tierra del Fuego, has forwarded his report to the French Geographical Society. From it there would seem to be a remarkable field for agricultural development in the country, virgin forests and prairies occupying a large extent of ground. Coal, copper, and iron—all of good quality—were found by M. Pertuisset to exist in abundance, and the mean temperature at midday was between 60° and 65° Fahr. Those of our readers who are interested in this little-known country, which, however, the Chileans seem bent on turning to account by their quiet and systematic method of occupying, colonising and exploring it, will find a concise article on the subject, entitled "The Straits of Magellan," in the *Ocean Highways* for last December.

THE 12th of June last (o.s.) being the tenth anniversary of the occupation of the town of Turkestan by the Russians, was celebrated as a fête-day by the settled and nomad population of the district, as well as by that of the adjoining ones of Chemkent and Perovsky. A funeral service was performed by the Russian troops to the memory of their comrades who fell in the battle of Ikan, and solemn prayers were offered up for the welfare of the Imperial family. After a march past, the officers, civil functionaries, and Russian merchants were invited by the inhabitants to a sort of strawberry feast, served in the Asiatic style, and accompanied with tea and *koumiss* or fermented mares'-milk. The most perfect good feeling seemed to prevail between the two races, and on the morrow a complimentary address was presented to General Kaufmann, in which all the principal inhabitants expressed their gratitude for the complete security to life and property, as well as the general prosperity, they had enjoyed under Russian rule.

FROM Yokohama we hear that, as the result of recent negotiations with the Japanese Government, it is probable that foreigners will shortly be permitted to travel in the interior under a system of passports and sureties.

COMMANDER PITMAN, R.N., of H.M.S. *Ringdove*, has surveyed the channel of the Poyang Lake, and has established the fact that, except in the winter season, vessels drawing 10 feet of water can get as far as Nan-chang foo, the capital of the province of Kiang-si.

FROM a Blue Book which has just been published, we learn that a new educational influence is now actively at work in Japan, one which is sure to extend its power very rapidly, viz. the Native Press which has sprung into existence in several parts of the empire. We are told that there are in Yedo no less than eighteen newspapers, some of which are published every day and others every fifth day.

"The three with the greatest circulation are the *Nishinshinjishi*, a daily paper of which on an average 1,500 copies are sold; the *Tokionichinichi Shimbin*, a daily paper with a sale of about 860 copies; the *Shimbansashi*, a daily paper with a sale of about 860 copies. Of the other fifteen journals some appear daily, and the sale of each is about 200."

A Japanese *Punch* has also just been started.

THE state of Sicily seems in many ways as grave as that of Spain; and much light is thrown on the causes which have produced such incidents as those recorded in Tuesday's *Times* by an article in the *Revue des Deux Mondes*. M. L. Louis-Lande traces the prevalence of *Malandrino*, or intermittent, as distinguished from regular, brigandage, to the mixture of races, as old as the time of Thucydides, the strong feeling of Sicilianism, misgovernment from time immemorial, bad communications, the want of education, and, it must be added, the influence of the clergy. The priesthood is so powerful that in the three years following the application of the new Italian code, there were in the provinces of Palermo, Girgenti, Trapani, and Syracuse, 8,847 purely ecclesiastical marriages, which are civilly null, and the children of which are therefore illegitimate in law; and the whole efforts of the priesthood are directed against the secular power. The Government has made great efforts for the spread of education; in 1860, 91 per cent. of the population could neither read nor write, and only about 800 children attended school at Palermo; in 1870 there were 30,000 children in the primary schools of the province of Palermo alone, beside 74 secondary and superior schools throughout the island. Roads are being rapidly constructed, partly at the cost of the State. Palermo has a district railway, besides a line to Termini and Lercara, which is to be continued to Catana, and another line is projected from Palermo to Trapani. Yet, in spite of this progress, as soon as rule by the sabre is given up, there is an instant revival of brigandage. Jurors are afraid to convict; the victim's friends are afraid to prosecute, and the brigands are protected by a general system of terrorism. M. Lande strongly recommends the adoption of something like the Peace Preservation Act of 1869. Trial by jury should be abolished, loyal and fearless men appointed as magistrates, the administration of justice be more prompt in its earlier stages, refractory witnesses be rigorously punished, the population be gradually but effectually disarmed, and lastly, convicts should be deprived of the hope of deliverance by a revolution by being transported to a prison in some remote province of Italy. The lapse of time and the advance of moral and material improvement will do the rest. M. Lande's article teems with information, and is, in fact, a concise history of Sicily during the last fifteen years.

A LITTLE work entitled *Recuerdos de Humboldt*, por Aristides Rojas (Puerto Cabello, 1874. 8vo. pp. 36), is interesting as showing the almost idolatrous respect which is paid to the memory of Humboldt in Spanish America. The additions to our knowledge of Humboldt's life are very slight. There is a very sensible letter of his upon the proposal to endow a chair of mathematics in the University of Caracas, in which he expresses his opinion, that if it were only possible to have one professor, then, looking to the undeveloped riches of the province, one of practical chemistry and physics was far more important than one of geometry. Dr. Rojas relates what he terms "un incidente gracioso," which happened to Humboldt at Calabozo. On approaching the llanos he was very anxious to obtain information about the electrical eels (*tembladores*) which abound in the rivers of the district. For this purpose he arranged to visit an eccentric student of electrical science, who before the appointed time, contrived with great difficulty to place one of the animals *en rapport* with the knocker on his study door. The servant directed the visitor to rap, and on his doing so, a

discharge of electricity took place, throwing him to the ground. This delicate and hospitable attention was received by Humboldt with smiles. The standard of taste varies, but it is hard to understand how such a vulgar practical joke could in any civilized country be considered "witty" or "pleasing."

MR. C. L. ST. JOHN, who was appointed, a year or two back, Vice-Consul at Jassy, has devoted a portion of the earlier period of his service to the useful work of collecting trustworthy information about the history and present state of Moldavia. A country in Europe less known than this, he remarks, probably does not exist; so we gladly welcome his report upon it (recently printed as a Parliamentary paper) as an important addition to our historical and geographical knowledge. The people of these principalities claim to be the descendants of a colony of Romans located here by the Roman emperor Trajan; hence the name of "Roumania," lately introduced, and now universally adopted by the natives as the name of the united principalities. The language spoken by all classes, apart from the testimony of history, shows these pretensions to be well founded. Many words of common use, such as *apa*, water; *pane*, bread; *lemn*, wood; *lapte*, milk; *alba*, white; *negru*, black, and numberless others, are almost pure Latin. During the last few years national schools and gymnasia for the higher branches of instruction have been founded in every town. These are conducted after the French model, and are entirely free. The whole system of jurisprudence is declared to be an exact copy of the French and the Code Napoléon. Of real slaves there have long been none in this country, except a number of gipsies who had become the property of the boyards or landed gentry, and were chiefly employed by them as domestic servants and mechanics; they were emancipated about twenty years ago. The country is purely agricultural. It exports large quantities of maize, wheat, and other cereals, besides cattle, hides, wool, &c. The common beverage is wine, which is produced in immense quantities; but from want of care and skill in preparing it, very little, if any, is exported. The hills surrounding Jassy on all sides are covered with vineyards. Great as the produce of the country is, it might be more than doubled, as scarcely one-half of the soil, which is everywhere good, is under cultivation.

Jassy itself contains nearly 90,000 inhabitants, of which 55,000 are Jews. Evidently it was originally an agglomeration of large houses, tenanted each by a rich boyard, and surrounded by the huts of his dependants. The huts have disappeared, to make way for regular streets, but the houses of the boyards remain. The town is situated on two hills, one rising gradually, the other so precipitously as practically to detach it from the rest of the town. As both hills are covered with trees, intermingled with houses, Jassy in general presents a picturesque appearance. The country surrounding it being hilly, with here and there an ancient monastery in view, and the Carpathians in the distance, is not devoid of attraction. There are forty-seven churches in Jassy, some of which are interesting from their architecture, a museum with a public library, a theatre, and five hospitals, the largest and richest of which is St. Spiridon; its revenue being nearly 50,000*l.* per annum. The trade between Jassy and Great Britain is not extensive. The number of British subjects at the beginning of 1873 amounted to ten; since the contract for paving has been given to an English contractor, the number has risen to fifty. In 1875 the railway from Odessa to Kischenew will be extended to Jassy and connected with the Austrian line.

THE LATE PROFESSOR COSMO INNES.

SCOTTISH history and antiquities have sustained a severe loss in the sudden death of Professor Cosmo Innes, which took place on the 31st ult., at Killin,

while he was on a tour in the Highlands. Professor Innes had passed his seventy-fifth year, having been born in 1798, at Durris, in Deeside. He was educated at Edinburgh, Glasgow, and Balliol College, Oxford, and was called to the Scotch bar in 1822; was from 1840 to 1852 Sheriff of Moray, and in the latter year succeeded Mr. Thomas Thomson as Clerk of the Court of Session. Since 1846 he had also filled the Professorial Chair of Constitutional Law and Constitutional History in the University of Edinburgh, where his lectures were very highly appreciated. He became early known as one of the most acute students of the ancient records of Scottish history, a department in which for many years he has been acknowledged *facile princeps*. He was a leading member and conductor of the great printing clubs of Scotland, the Bannatyne, Maitland, and Spalding, and for these he personally collated and edited the Chartularies of nearly all the old religious houses of the North, beside making many other well-known contributions to the history, literature, and antiquities of his country. Among these may be mentioned his edition of Barbour's *Bruce*, the Introduction to which contained the first sound and sensible words on Scottish philology which had been written for half a century; and the *Origines Parochiales Scotiæ*, a work of immense research and value, in which he had as joint-editor the late Sir Thomas Makkdougall Brisbane. But the greatest of his works were in connexion with editing and publishing the Scottish Statutes, in continuation of the labours of his predecessor, Mr. Thomson, labours in which he was engaged for many years, and which at his death were within a few months of completion. They include a gigantic folio volume introductory to the series, containing all that remains of the earliest Scotch statutes, the *Fragmenta Vetusta*, *Assisæ* of the early kings, the *Leges Quatuor Burgorum*, *Leges inter Scotos et Bretton*, &c.; Original Records of Parliament extending to about 3,000 folio pages, formerly supposed to have been destroyed, but since discovered in the State Paper Office in London, whither they had been removed, it is said, by Cromwell; an Appendix volume, embracing "the Acts and Ordinances of the Government, Letters, and Papers of State," under the Commonwealth; volumes of the Rescinded Acts; and a General Index to the whole series of Acts of the Scots Parliament from 1104 to 1707; the last a work of truly enormous labour. His introduction to the Chartularies, as indeed to all the works edited by him, among which we may notice the magnificent series of facsimile reproductions of the Scottish Public Records—are distinguished by the living interest which they throw around these dry bones of the past. In the words of the *Inverness Courier*, "the scholarly manner in which he has given the Chartularies to the public has excited the admiration and envy of the most famous scholars, and it is related how M. Guizot took down from the shelves of his library volume after volume of Mr. Innes's works, and turning to the author, said, 'Monsieur, they are all done according to mine own heart.' A sympathetic and appreciative notice in the *Scotsman* says:—

"With two or three exceptions, all now deceased, we believe Mr. Innes has never been surpassed in his skill in deciphering and extracting the meaning of old writings. To one endowed with similar tastes, it was an enjoyable sight to see him in his editorial chair correcting proof sheets, spelling a hard passage, turning the beloved old charter in various lights, pulling down from the shelf dictionary after dictionary, and preserving silence till he could pronounce on the right reading. Along with a passion for this description of lore, he had a habitual accuracy and a strong common sense that hardly ever failed to guide him to the right channel of inquiry, and pointed out to him distinctly where evidence ended and conjecture began."

His works of a historical and antiquarian kind form a moderate library of themselves. His *Scotland in the Middle Ages*, a recast of a portion of

his historical lectures, continued again in his *Sketches of Early Scotch History and Social Progress*, his *Lectures on Legal Antiquities*, his book *Concerning Scottish Surnames*, and many kindred works, are known only to be prized for their thoroughness of honesty and execution. How he occasionally diversified these more abstruse studies, is seen in his genial sketch of the *Life of Dean Ramsay* prefixed to the twenty-second edition of the *Reminiscences of Scottish Life and Character*, a new edition of which was passing through the press when he died; also in many papers contributed to the *North British Review* and the *Quarterly*, on such subjects as *Wild Sports in the Highlands*, *Country Life in England*, *Presbyterianism in the North*, &c. He had himself an intense love for field-sports and natural history, which he loved to escape from his books to gratify. In private life he was much beloved by all who knew him for his truly gentlemanly and amiable disposition; and his death is deeply lamented by a numerous circle of friends, not only in Edinburgh, but in England and on the Continent, while in his special department of literary work, he has left a blank which will be long unfilled.

J. A. H. MURRAY.

ROYAL HISTORICAL AND ARCHAEOLOGICAL ASSOCIATION OF IRELAND.

THIS society is now in its twenty-fifth year, and to judge from the volume of *Proceedings and Papers* for the year 1873, is in a flourishing condition, both financially and in other respects. The volume is well and clearly printed, and the illustrations are plentiful and good. The subjects of the papers are almost exclusively Irish. Ogham inscriptions, crannogs, and other purely Hibernian antiquities occupy a considerable proportion of the papers, but there are some of more general interest.

The Rev. J. Graves contributes an account of an autograph and facsimile of Lady Elizabeth Fitz Gerald, "the Fair Geraldine" celebrated by the sonnets of the Earl of Surrey. It is a portion of a letter written for her second husband, Lord Clinton, in 1558, just after his return from his expedition against Brest. Though her name is not signed, there can be no doubt of the writing being hers, as Lord Clinton, in the latter portion of the letter, states that he has made his wife his secretary, "for lak of strenth," which is incorrectly printed in the copy of the letter "lak of seeing." Mr. Graves elsewhere mentions Lord Clinton as suffering from loss of sight, but we presume this misreading is the only authority for the statement. His paper is also illustrated by an autotype of a portrait of the lady in question in the possession of the Marquis of Kildare, which is a copy of a picture by Ketel at Woburn Abbey. Red hair, high cheek bones, and a long chin are the principal features of "her beauty of kind" which produced so much impression on a married man many years her senior. Mr. Graves believes that Surrey's attachment to her was purely platonic, and shows the absurdity of the exaggerations which grew up to embellish the story, such as the fable of his travels in Italy to proclaim the charms of his mistress, and maintain the fame of her beauty in a tournament. Mr. R. R. Brash describes some pillar stones at Gowran, and attempts to interpret their Ogham inscriptions. These, Mr. Brash believes, were originally pagan monuments, but were subsequently utilised by Christians, who turned the stones upside down, and marked them with the sacred symbol of their religion. "This is the story of the stone, as plain and palpable as if we were looking at the whole process." On the other hand, Dr. Ferguson sees no reason to believe that such a practice ever existed; but we have no space for going into the arguments on either side. The interpretation of Irish inscriptions must be a very uncertain task if other antiquaries follow the example of Dr. O'Donovan, who confesses in a letter that he

carved a name under an inscription on a cromlech at Lennan, "to puzzle future antiquaries." Irish pedigrees also evidently suffer from a want of authenticity. The writer of a very interesting paper on the history of the clan Kavanagh, gives a long pedigree from the eleventh century to the present day, which differs in "very important particulars" from others which have been authenticated by the family. But whether the pedigree be correct or not, the history of the gradual decline of the clan is carefully worked out from the time when the McMurrough was king of Leinster, and received a "black rent" of 40% from the Crown, through the various confiscations and emigrations which broke up the clan, to the present day. Another article, entitled "A Ramble round Trim," is illustrated with views of the neighbourhood and drawings of monuments in the church, some of which are curious. The armorial bearings on the tomb of Henry Browne (1581), are surmounted by three crosses, probably typical of the crucifixion. This mixture of sacred and heraldic symbolism is very unusual, though there are instances in Ireland and elsewhere of armorial bearings entirely composed of sacred symbols, and known as the "Arms of the Redeemer." The same paper contains a short biography of Richard Butler, Vicar of Trim and Dean of Clonmacnois, who died about twelve years ago after a long life, the leisure time of which was chiefly devoted to antiquarian pursuits.

C. TRICE MARTIN.

A LONDON ALDERMAN'S JOURNAL, 1796-7.

A PRIVATE contemporary record of London life and opinions during a period when Europe was distracted by the effects of the then recent French Revolution, and the dawning military genius of Bonaparte, should have considerable interest and value. We have recently met with such a record among the manuscripts in the British Museum, in the shape of a diary kept during a few months by one who, as is evident from some of the entries, filled the office of alderman in the City. In laying some extracts from it before our readers, it is only necessary to remark that the worthy chronicler's views on some political matters are of a very pronounced character, and that we by no means wish to identify ourselves with them.

"London, Tuesday 18th October to Saturday, 22nd October, 1796.

"These five days may be called rather days of expectation than of event, for there has nothing occurred of material import. Lord Malmesbury and his suite left Dover on Tuesday in the morning about ten. Various are the opinions as to this Embassy. Mr. Burke laments in bitter terms the degradation of the country in sending an ambassador to these miscreants, these vile usurpers, these regicides! and yet with every epithet of abuse against the administration of the country for making the attempt, in which Mr. Pitt must of course take his share of the culpability, he concludes in a glowing panegyric on Mr. Pitt, who, he says, is the only man who can rescue us from the impending destruction. Mr. Pitt has an uncommon share of talents 'tis true; but if we may form any judgment of what is to be from what has been, he has given us a miserable proof of his abilities as a War Minister—debt, taxes and disgrace may in truth be placed to his account. Burke, too, has talents and perhaps friends (who will be puzzled perhaps to convince the public of the propriety of his pamphlet at the present moment), but I think Burke the most mischievous fellow that ever lived, an enemy to the country and the most dangerous of all bad men, an apostate to (sic) all that is honourable virtuous or just! I have no opinion of the Embassy and I think that Lord Malmesbury will speedily return without his Embassy, and Mr. Pitt seems to think so too, or he would not so hastily augment the Militia 60,000 men.

"On Wednesday Mr. Horne, of Paternoster Row was elected alderman of Castle Barnard Ward, in room of Sir John Hopkins, and on the same day died suddenly William Davis of Tower Hill, elder brother of the Trinity House, an acquaintance of mine since 1765.

"On Friday arrived three mails from Hambro', and instantly reports were circulated that nine important battles had been fought, that General Bournoville (Beurnonville) had been killed—Moreau annihilated with all his army—Bonaparte defeated with the loss of 6000 men and himself taken prisoner; but when the prints were published it appears that the Austrians under General Werneck and the army of the Sambre and Meuse had remained in a state of inaction since the 29th ult^o. On the 23rd the Austrians made an unsuccessful attack on the French on Neuwied, on the 29th renewed the attack and carried it by assault; after which a meeting was held by the generals of each side and the town declared neutral. In Swabia General Moreau evacuating Ulm, and retiring by Biberach . . . , and so far from the defeat of Bonaparte, from Milan dated the 27th, General Wurmser had lost 600 men in an unsuccessful sortie from Mantua for forage. . . .

"These seem the leading features of the week. The weather has been various, but mostly mild and fair; corn rather dearer, but the price of bread continued at 8^d. I dined every day in the Boro' except Friday, when I dined at the Jerusalem with Gildincké (chair) Bolton, Forbes, Mitchell, and a Mr. Gillan, visitor; eat oysters afterwards at John's. On Tuesday supped at Mr. Nutt's. On Wednesday saw Downton in *The Jew*, admirably performed, with the Triumph of Love and '2538,' an incomparable dance, and elegantly arranged. On Thursday at the same theatre (Drury Lane) saw part of *A Bold stroke for a Wife*, and for the first time revived *Richard Cœur de Lion*, got up with splendid decorations and well supported truly by Mr. Crouch and Kelly. On Saturday dined at the Three Tuns in the Boro', a miserable house for a London tavern, but the people were civil and the beef-steak tolerable. To the York for a few minutes, read the Gazette and the papers which contain *nil*, and home at twelve.

"Sunday 23 October 1796. The morning dark and gloomy, but about noon a smart shower cleared the air, and we had fine weather—walked with J. P. two hours in St. George's Fields and afterwards dined with Mr. Alderman Clark *en famille*. Mrs. Clark, the two sons, and his mother, who completes on Wednesday next her 92nd year, a little deaf, but otherwise her faculties are unimpaired; she sees very well, and talks very well and loud and laughs heartily. She eats and drinks and sleeps well and bids fair to live as yet some years. She said she very well recollected the reign of Queen Anne, though she never saw her, but she saw George the First pass to the House of Parliament the first time he went there. She was born at Abingdon and was highly delighted to hear that I had been there, and it quite cheered her heart when I spoke of the beauty of the situation and the charms of the ride from Abingdon to Wallingford. Her grandfather died aged 101, and her grandmother at 99, and this old lady may possibly live as long or longer than either of them. . . . The alderman conceives the French are in their last agony. 'Go on with the war, and we shall conquer them at last,—a very pretty speculation! Bonaparte is soon to be done over, and the Italian ports soon will be opened to our manufacturers. I walked on to John's but the doors were shut, called on Murray and returned to the York, where I spent the remainder of the evening with Mr. — from Leeds, and an officer in Hussar dress, who wanted turtle-soup for supper.

"Thursday, 27 October. By the papers the mail from Hambro' is arrived! which brings the usual multitude of contradictory accounts of marches and skirmishes—of battles fought at places the names of which can neither be found in the map, and hardly to be pronounced, if found, of advances and retreats; and leaves one, after having toiled through columns of narrative, in the same state of uncertainty as before we began. The only serious event that has taken place since the last despatches is a battle which took place on the 2nd between General Latour and General Moreau, and taking it upon the testimony of the Vienna Gazette it was a scene of lamentable slaughter. The Austrians were beaten with considerable loss, 600 they themselves state, after the most obstinate resistance, but neither this nor any one of the actions seems to be of any other importance to the campaign than that it cuts off from the face of the earth so many men. It is useless massacre! for the next day Moreau recommences his retreat in great order, and the day after that Latour collects his scattered force and renews his pursuit.

The heart turns from the scene with horror! Often has Moreau been defeated (in the papers) and even his army annihilated (in both houses of parliament). It appears that the general felt himself strong enough to rest in his positions, so as to turn occasionally on his pursuers and to conduct his retreat with consummate skill, with a slowness and circumspection which betrays neither weakness nor alarm.

"Friday, 28th October. By the London papers this morning the papers from Paris down to the 23rd inclusive are received after an interval of sixteen days, the last date being the 7th instant. Lord Malmesbury arrived on the 23rd, but not a word further respecting the mission has transpired. The King of Sardinia is dead, and the King of Naples has made peace. The King of Spain has declared war, which well might be expected, and a Spanish squadron has chased Admiral Manx into Gibraltar. Stocks again have fallen, so flourishing is the situation of the country, to 56! Though the details from the continent are not very circumstantial yet the result is certainly of great importance. It is now ascertained beyond a doubt that Moreau has shown himself worthy of being called a pupil of General Pichegru. 'Mid all the peril of his situation, and the prognostication of his most inevitable fate by all the ministerial prints and their sycophants in both houses and elsewhere, he has effected his retreat. After considerable opposition and many warm engagements he has cleared all the defiles of the Black Mountains and on the 11th inst. established his head-quarters at Rhinefelden. On Wednesday an address was presented from the City to the King thanking his Majesty for the preliminary step taken towards the attainment of peace, by sending an ambassador to negotiate, &c. Two of our weak-headed aldermen were knighted on the occasion, namely, Stephen Langston and William Staines, the present Sheriffs!

"Tuesday, 8 Nov. Very fine weather; no news; dined in the Boro', walked several times round Finsbury Square. . . . Alderman Watson sworn in at Guildhall Lord Mayor of London; the farewell dinner at the Mansion House.

"Wednesday, 9 Nov. 1796. Lord Mayor's Day, and a very fine day it was. The Lord Mayor &c. as usual took water at the Three Cranes, and to Westminster, from thence back (Bridge Street in a state of repair), and in procession to Guildhall. Mr Pitt was much insulted; Fox and Skinner and Combe were applauded, their horses taken off and carriages drawn by the multitude. The ancient splendour of the City in the streets seems dwindling to nothing, and in a very few years perhaps will be totally disregarded. Few of the aldermen attended, and the Musicians' Company only attended of which Mr. Watson is a member. The dinner was sumptuous and the company respectable—the Duke of York, Prince Ernst, Foreign Ministers, Lord Chancellor, Mr. Pitt, Mr. Fox, &c. I dined very late at the York, and from thence to Covent Garden Theatre, saw the last scene of Reynolds's new comedy, *Fortune's Fool*, of which I could form no judgment. *Olympus in an Uproar*, very splendid scenery, but in point of merit not equal to *The Golden Pippin*, on which it is founded. Nan Calley of famous memory was the Juno of former times and never failed of an encore of the celebrated catch 'Push about the Jorum,' which in the present representation is omitted. Leaving the house I was recognised by my sister Mrs. Turnbull, who insisted on taking me home to Broad Street—contrary to my resolve never to visit them more. Mutual explanations however produced reconciliation and at one in the morning we parted very good friends; so that as it has turned out the day was spent better than if I had gone to the Lord Mayor's Feast.

"Accounts have reached us of the determination of General George Washington to resign his situation as President of the United States. His farewell address is dated 17 Sep^r; in many parts most admirably written, but I think upon the whole rather too long. I dined Mr. P. at Mr. Benjamin Collett's; while we were at dinner my friend Mr. James Bell called to inform me that in course of the day died John Wilkes, Chamberlain of London, and alderman of Farringdon Without. Few men have made in the world more noise—peace to his ashes!

"Sunday, 13 Nov. Never was there a finer day since the days of King Lud! At home till three, walked with J. P. over St. George's Fields, thro' the park, Buckingham Gate to Hyde Park Corner, to Oxford Turnpike and through the squares to the Percy Street

Coffee House, where we dined at six and dined well, good wine and good company, a Colonel Lenox was there, Samuel Gist formerly of Lloyds, with a French Ecclesiastic. We chatted till nine, and finished our evening at the York. An extra Gazette was published with letters from Mr. R. Craufurd and Capt. Anstruther, with a continued detail of blood and slaughter; the armies have been constantly engaged, and, according to these accounts, terminated always in favour of the Austrians, which the French do not admit; nor can it very well be credited, for Moreau, though so often defeated, cut to pieces and annihilated, has made good his retreat—a retreat not to be paralleled since the days of Xenophon—and crossed the Rhine without molestation.

CORRESPONDENCE.

THE ENGRAVED WORKS OF SIR JOSHUA REYNOLDS.

100 Strand: August 11, 1874.

WHEN a compiler professes to correct previous catalogues we are justified in stating any errors that may occur in his work. Two such errors in Dr. Hamilton's Catalogue are pointed out in the article on "The Prints after Sir Joshua Reynolds" in your last number, and I append some others:

Page 7. Sir William Blackstone. Dr. Hamilton states that proofs of this engraving are very rare; it is a pity he did not see a lettered impression, for he would then have found that the picture was painted by Gainsborough.

Page 11. Charles Pratt, Lord Camden, whole length, standing in his robes, holding the Magna Charta in his hand, engraved by Spilsbury, is painted by William Hoare.

Page 17. John Frederick, Duke of Dorset, the engraving without the star is by T. Hardy, 1799, not S. W. Reynolds.

Page 20. Adam Ferguson, engraved by *Beugo*, not *Bengo*, known as a printseller.

Page 22. Garrick between Tragedy and Comedy. Dr. Hamilton states it is engraved by Valentine Green, 1769, and that all the others are copies. This is not correct, as there is a very fine engraving by E. Fisher done in 1762.

Page 23. Lord George Sackville, in second state of the plate, called Lord George Germain. Dr. Hamilton carefully describes the first state of the print, and then puts the date 1777, when his description ought to have the date 1750.

Page 24. Prince William Frederick of Gloucester, engraved mezz. by Caroline Watson; it is in stipple.

Page 34. The three sons of Sir Peniston Lamb, Bart., first Viscount Melbourne, also stipple, though called mezz.

Page 41. Thomas Newton, Bishop of Bristol, Dean of St. Paul's; date on the proofs is 1775, not 1773.

Page 49. John, Lord Sheffield, engraved in stipple, not mezz., by John Jones.

Page 57. H. R. H. Frederick, Duke of York, engraved by J. Jones, in stipple, not mezz.

Page 60. Elizabeth, Countess of Ancrum (this is one of the three ladies of whom Dr. Hamilton has corrected the description; her name is no longer to be spelt Ancrum), engraved in mezz. by Inigo Spilsbury. Dr. Hamilton gives the picture as painted in 1771. Now on the engraving the name is Jonathan, and the date 1770; the work is very indifferent, without the slightest resemblance to that very fine engraving of Miss Jacobs, by John Spilsbury, and certainly inferior to Inigo.

Page 67. Lady Cadogan. Another error that shocks Dr. Hamilton, who says her name is Mary, not Maria. I think there is no doubt Mary and Maria are one and the same name, for instance, the name of Mary Queen of Scots, Mary 1st and 2nd of England, on all engravings I have examined is printed Maria. Lady Cadogan's husband was the third Baron, not the second.

Page 72. Lady Ann Luttrell, widow of C. Horton, Esqre. according to catalogue, married Henry Frederick, Duke of Cumberland, son of George II. He was the son of Frederick, Prince of Wales, and brother to George III.

Page 75. Miss Kitty Fischer; on the letter in the plate by R. Houston, is written, 1753, Jan. 2nd, not Jan. 1st, 1763.

Page 89. Miss Meyer, as Hebe, engraved by John Jacobé, 1760, ought to be 1780.

Page 108. Birth of Bacchus, is another of the plates in stipple which is stated to be mezz.

Page 109. Children in the Wood, engraved in mezz. by James Watson, in 1772, Dr. Hamilton says was painted in 1773.

JANE NOSEDA.

"IL GRAN RIFIUTO."

Newington Butts: August 12, 1874.

IN the notice of Dr. Farrar's work, *The Life of Christ*, in the last number of the ACADEMY, the reviewer remarks that the author

"steps aside for a moment to suggest what we believe to be a new interpretation of a well-known passage in Dante (*Inf.* iii. 59, 60)—

'colui,

Che fece, per villate, il gran rifiuto,'

by referring it directly to the young ruler of Matt. xix. 22, instead of to Pope Celestine, as is usually done."

When the mind broods for any length of time on a special subject its activity comes to resemble somewhat the movement of a whirlpool, which draws down within its vortex whatever approaches it. This may help to explain Dr. Farrar's digression, and his conjecture touching the young ruler, which is not worse than the conjectures of those who once thought that Esau was meant, or Diocletian, or Augustulus; but these conjectures are all swept away by the statement of Dante that the nameless individual was one whom he had personally known, and was conspicuous among many others whom he recognised:—

"Poscia ch'io v'ebbi alcun riconosciuto,

Guardai, e vidi l'ombra di colui

Che fece per villate il gran rifiuto."

And then he knows that his crowd are

"la setta dei cattivi,

A Dio spiacenti ed a' nemici sui."

It is more than doubtful if Dante ever saw Pietro da Morrone, afterwards Celestin V. The probability is that he never did; and where he alludes to him (*Inf.* xxviii. 105-8) it is not in anger or contempt. Pietro da Morrone was a simple-minded holy man, devoted to prayer and divine meditations; he was elected Pope much against his will, and finding himself quite unequal to the office, with much humility resigned it.

In Portirelli's edition of the *Divina Commedia* (Milano, 1804) there is a very sensible note on this subject as regards Celestin; the editor thinks some fellow-citizen was meant, but who it

is extremely difficult to say: his words are: "Ma sarebbe impossibile di conoscere chi fosse colui de' suoi concittadini che Dante mette tra i poltroni."

Some few years ago I endeavoured historically to solve this question, and by the aid of contemporary chroniclers and early commentators and others who had reflected on the subject, arrived at the conclusion that Messer Vieri de' Cerchi, the head of the Bianchi in Dante's time, was the individual meant. Vieri de' Cerchi had shown himself previously not to be wanting in courage, but in 1301 acted such a dastardly part in refusing to oppose Carlo di Valois and M. Corso Donati, when he had it in his power to do so, that the poet's political prospects were ruined, and himself and his party driven into hopeless exile.

To the pusillanimity of the Bianchi, and especially of their chief, Messer Vieri de' Cerchi, all the misfortunes of the party were owing. By this, and their subsequent conduct, Dante came to loathe and abhor them, and felt that being mixed up with such a set was the most distressing feature of his exile:—

"E quel che più ti graverà le spalle,
Sarà la compagnia malvagia e scempia,
Con la qual tu cadrai in questa valle;
Che tutta ingrata, tutta matta ed empia
Si farà contra te; ma poco appresso
Ella, non tu, n'avrà rossa la tempia."
(*Id.* xvii. 61-66.)

My *brochure*,* published in reference to this question, has been translated into Italian and reprinted in Italy. H. C. BARLOW.

THE PHOENICIANS IN BRAZIL.

Liverpool: July 22, 1874.

TRANSCRIPTION of the Phœnician characters into Hebrew, and division of the words:—

1. נחנא ² בן כנען מצדן מהקרת המלך סחרה ³ שלך [שלה]
2. לאאנא (?) יורה ⁴ קת ארץ הרם ⁵ ונשת [ונשא]
3. בחר לעליונם ⁶ ועליונת. בשנת ⁷ תשעת ועשרת ⁸ להרם מלכנא ⁹ אבר
4. ונהלך ¹⁰ מעצו [מעכו] ננבר בים ¹¹ ספון נסע עם ¹² אנית עשרת. לחרם ¹³ להם
5. ונהיה בים יחדו שתם שנם סבב לארץ ¹⁴ להם
6. מי רב עלו לאנה-¹⁵ את דברנא ונבא הלם שנם ¹⁶ עבר
7. מתם ושלשת נשם באי ¹⁷ חרתא שאנכי מתעשרת ¹⁸ אבר
8. חבלתאי עליונם ועליונת יחננא

NOTES.

¹ נחנא, *we*, is Chaldaic; Hebrew נחנו. ² בן, *sons of*. The final *n* is dropped. In this inscription, as in many other ancient writings, the plural Yod is omitted, ending *ם* instead of *ים*.

³ שלך is evidently a mistake of the copyist; *שלה* seems to be the proper word.

⁴ לאאנא quite unintelligible; must also be ascribed to inaccurate transcription. I venture to substitute *לעלם* (לעלם) for *ever*.

⁵ קת, *to serve, to support*. Obsol. Rad. (*vide* Gesen. *Lexicon*, קתה).

⁶ ונשת, probably for ונשא, and exalted.

⁷ תשעת ועשרת. In Phœnician generally, as in Hebrew frequently, ת instead of ה is used at the end.

⁸ להרם, of the utter destruction; analogous to *והא מלכה ההרם*, the king thereof he utterly destroyed (*Joshua* x. 28).

⁹ אבר, *strong*. I am rather doubtful about this word. I am inclined to think that it may be a

noun proper, meaning, with the preceding מלכנא, our King Abar, or Abad, perhaps *Abda-startos*, one of Iliam's successors.

¹⁰ מעצו, from *Accho*, instead of מעכו. The final *ו* of עכו does most likely belong to the next word, which is then more correctly read וננבר, and we conquered. עכ, *Accho*, without *ו* is found on Phœnician coins (*vide Monumenta Phœnicia*, Gesenii). The soil not yielding sufficient maintenance, the Phœnicians resorted to piracy.

¹¹ ספון, a ship-master. The Chaldee translation of מלחך, thy mariners (*Ezek.* xxvii. 27), is ספון. The word is Hebrew, as בירכתי הספינה, in the sides of the ship (*Jonah* i. 5), and much used in Rabbinical writings.

¹² להם, *warm*. The ל is superfluous; probably a mistake.

¹³ ונברל, and separated, or remote.

¹⁴ את חברנא, our company. The sentence is here incomplete; some words may have been omitted.

¹⁵ חרתא, *new*, is the Chaldee term for חריש.

¹⁶ אבר. In the copy before me this word is the last in the 7th line, while Dr. Euting has it the first in the 8th.

¹⁷ וחבלתאי בני יהודה, apportioned, as חבלתאי בני יהודה, out of the portion of the children of Judah (*Joshua* xix. 9).

TRANSLATION.

1. We, the sons of Canaan from Zidon, the Royal City; may her commerce

2. . . . flourish supporting the high and exalted land chosen by (or for) the supreme (Gods)

3. and supreme (Goddesses). In the nineteenth year of the destruction of our mighty King (or King Abar)

4. we set out from Accho and conquered in the sea a mariner journeying with ten ships.

5. We were together in the sea two years, surrounding a warm and remote land.

6. Mighty waters entered the fleet . . . our company. We came hither twelve

7. men and three women into this new- (ly discovered) island which I mightily enriched (cultivated)

8. and apportioned. The supreme (Gods) and supreme (Goddesses) be gracious unto us.

JACOB PRAG.

SCIENCE.

THE GEOLOGY OF BELFAST.

MUCH of the interest, both scientific and popular, which circles around the town of Belfast as a centre, may be traced to the geological structure of the surrounding country. Not to go farther than the range of the Belfast Hills, one may read even there a singularly instructive epitome of geological history. Eruptive rocks, marine deposits, and lacustrine beds rest in succession one upon another, and may all be exposed within the limits of a single section. Even to the most casual observer the very form of the ground, especially the bold escarpment of the hills, suggests questions which can be answered only by an application of the principles of geology. In the presence of such scenery a man becomes a geologist in spite of himself, and though caring but little for the subjects usually discussed in Section C, may yet welcome a popular sketch descriptive of the structure of the country. Those who seek a more detailed acquaintance with the subject may be referred to the maps of the Geological Survey of Ireland—especially Sheets 36 and 37—and to the accompanying "Explanatory Memoirs," by Professor Hull, Mr. J. L. Warren, and Mr. W. B. Leonard.

Rising on the northern slope of the Slieve-Croob Mountains, in the heart of the county Down, the River Lagan flows at first over a great tract of Silurian ground, and then winding sluggishly through a valley of New Red Sandstone, at length empties itself at the head of Belfast Lough. This lough is a broad inlet of the Irish Sea, separating the county Down on the south from county Antrim on the north. Just at the junction of the river with the bay, the town of Belfast has been built. The foundations of the town rest for the most part upon alluvial deposits brought down by the Lagan and its tributary, the Blackstaff, and mixed with the sand and silt of the estuary. Excavations in the streets and in the harbour of Belfast have shown that the deposits of sand and silt are associated with beds of recent shells, and with marine peat. These comparatively modern deposits are based upon the red rocks of Triassic age, which occupy the valley of the Lagan, stretching in a south-westerly direction from Belfast. This valley, with its expansion in Belfast Lough, divides the district under description into two areas, as sharply separated from each other geologically as politically. On the right or county Down side of the valley the rocks are almost exclusively palæozoic, whilst on the left or Antrim side they are without exception of secondary and tertiary age. It will be convenient to describe the several formations in ascending order, commencing with the most ancient and passing progressively to the newest.

Rocks of palæozoic age rise from the southern shore of Belfast Lough, and occupy the greater part of the county Down. They consist chiefly of a succession of grits, sandstones and conglomerates, of which the prevailing colours are grey, green, and purple; these are associated here and there with bands of black slate and shale, which in some localities contain graptolites. By far the greater part of these palæozoic rocks may be referred to the Bala or Caradoc stage of the Lower Silurian group; at the same time some of the beds may possibly belong to the underlying Llandilo series, whilst it has been suggested, though apparently on insufficient grounds, that a few patches, differing from the surrounding rocks, may be even as old as the Cambrian formation. The Lower Silurian rocks of this area have a general north-easterly trend, and usually form elevated ground, rising for example to a height of 720 feet at Carnagaver Hill, to the north-east of Belfast.

There is evidence to show that the Silurian strata had been greatly disturbed and denuded prior to the deposition of the overlying beds. Only a few fragments of these higher palæozoic rocks now remain. At Cultra, near Holywood, on the southern shore of Belfast Lough, there are certain dark grey and black shales, containing *Modiola Macadami* and other fossils of the lower limestone shale. Shales, probably of the same age, occur at Castle-Espie, near Comber, on the western shore of Strangford Lough, where a red or salmon-coloured limestone is extensively quarried. This strip of carboniferous limestone is highly fossiliferous, and yields gigantic specimens of the cephalopod *Actinoceras giganteum*, called by

* *Il Gran Rifuto: what it was, who made it, and how fatal to Dante Allighieri.* (London: Trübner & Co., 1862.)

the quarrymen "pillars." The fragmentary patches at Cultra and at Castle-Espie are the only rocks within the Belfast area which can be regarded as representatives of the lower carboniferous series—a series which is developed on so grand a scale in the southern and central parts of the island.

East of Cultra pier is a small exposure of red marls and yellow dolomites, to which attention was first directed many years ago by Dr. Bryce, and which Professor King, of Galway, has since referred to the Upper Permian series. They contain such characteristic fossils as *Schizodus Schlottheimi*, *Bakevillia antiqua* and *Pleurophorus costatus*. The dolomites, or magnesian limestones, of Cultra were formerly exported to Glasgow for use in the manufacture of Epsom salts.

At the base of the secondary series of formations lies the great group of Triassic rocks, divisible in this country into a lower or Bunter group, and an upper or Keuper series. The Bunter beds not only occupy the broad valley of the Lagan, which runs in a south-westerly direction from Belfast, but spread over an old valley in the palaeozoic rocks, which stretches eastwards from Belfast to the shore of Strangford Lough. These Bunter beds consist, in their lower part, of shales and flaggy sandstones, overlaid by soft massive sandstones, red, yellow, and variegated in colour, and frequently exhibiting oblique lamination. Some of the sandstones are quarried for building purposes. Notwithstanding the general absence of organic remains in the Bunter sandstones, Professor Hull several years ago succeeded in establishing a three-fold division of this series. According to his classification, based on the lithological characters of the beds, the fully-developed Bunter series, as exposed in Lancashire and Cheshire, admits of division into an Upper and a Lower group of Mottled Sandstones, separated by the Pebble Beds. It is believed that the Bunter Sandstones in the Belfast area may be placed on the horizon of the Upper Mottled Sandstones, the lower members of the Bunter group being unrepresented in this district.

The Bunter series is immediately succeeded by the New Red or Keuper Marls, although on the Continent the two groups are separated by the fossiliferous limestone known as the Muschelkalk. It seems probable that the British area occupied by Bunter rocks was elevated into dry land previously to the deposition of this marine limestone. The Keuper series of the Belfast district consists of shales and sandstones, overlaid in some places by red, green, and mottled marls. Some of the sandstones are ripple-marked, sun-cracked, and pitted as if by rain-drops, whilst others exhibit pseudomorphous crystals which have borrowed their cubic forms from the prior crystallisation of common salt. Several products of economic value are yielded by the Keuper rocks. Thus, the Lower Keuper Sandstone is quarried as a building material, whilst the marls are used for brick-making: these marls, too, contain veins and bands of gypsum and valuable deposits of rock-salt. The salt is largely worked at Duncrue, near Carrickfergus. From the presence of salt and the prevailing red

colour of the rocks, Professor Ramsay has been led to the conclusion that the New Red Marl must have been deposited in a vast salt-lake.

Connecting the Triassic series with the overlying Lias is a group of passage-beds, known indifferently as the Rhoetic, the Penarth, or the *Avicula-contorta* series. The development of corresponding beds in the Rhoetic Alps of Bavaria, and again at Penarth, near Cardiff, in South Wales, has suggested the two former names, whilst the third is borrowed from a highly characteristic shell, first described from the north of Ireland by the late General Portlock. The Rhoetic series is well represented in the county Antrim, and a capital section is exposed at Collin Glen, only four or five miles to the south-west of Belfast. This section has been accurately described by Mr. Ralph Tate, who was the first to suggest its proper interpretation. Here the Rhoetic beds consist of a succession of black shales, thin-bedded sandstones, and impure limestones, surmounted by the zone of White Lias, and containing shells eminently characteristic of the Rhoetic series, such as *Avicula contorta*, *Cardium Rhoeticum*, *Pecten Valoniensis*, and *Axinopsis (Axinus) cloacinus*. The *Avicula-contorta* zone extends from Collin Glen to the north-east of Belfast, and thence to Larne, everywhere underlying the lowest beds of the Lias.

According to Mr. Tate, the Lower Lias of Ireland may be divided into four zones, of which the three lower should be correlated respectively with the zones of *Ammonites pleuorbis*, *A. angulatus*, and *A. Bucklandi*, whilst the fourth zone belongs to a higher division of the series. The celebrated Liassic rocks of Portrush, near the Giant's Causeway, are fossiliferous shales so indurated by association with eruptive rocks, as to assume a porcellaneous texture, and resemble a flinty slate or chert.

If the sequence of geological formations were uninterrupted, the Lias would be immediately followed by the thick series of Oolitic rocks. In Ireland, however, the Oolites appear to be entirely unrepresented, and the Liassic rocks are succeeded *magno intervallo* by the upper members of the Cretaceous formation. Beds representing the Upper Greensand, and resting upon the Lias, or even upon still older rocks, crop out from beneath the Chalk along the entire line of the Belfast Hills. Mr. Tate proposed to distinguish these beds as the "Hibernian Greensand," maintaining that the term "Upper Greensand," in the sense in which it is used by English geologists, is not sufficiently comprehensive. The Hibernian Greensand, which may be correlated with D'Orbigny's *Étage Cénomanien*, consists of three distinct zones. The lowest part is made up of dark bluish-green sands, coloured by glauconitic granules, and characterised by the occurrence of *Exogyra conica*; these sands pass up into grey marls and yellow sandstone, containing such fossils as *Ostrea carinata* and *Pecten quinquecostatus*; and this division is followed by chloritic sands and sandstones yielding *Exogyra columba* and numerous remains of sponges. To this uppermost division may be referred the curious mottled conglomerate known locally

as "mulatto stone;" this is a hard calcareous rock, speckled with grains of glauconite, and containing embedded pebbles of quartz. Phosphatic nodules occur in the lower glauconitic sands, but are too sparsely distributed to be profitably worked for agricultural purposes. An analysis of some of the greensand nodules, by Dr. Hodges, of Belfast, gave 3.24 per cent. of phosphoric acid, corresponding to 6.68 per cent. of tribasic phosphate of lime.

Another break in the geological series disturbs the sequence between the Upper Greensand and the Chalk. In the absence of the lower divisions of the Chalk, the eroded surface of the Upper Greensand is immediately covered by the Upper Chalk, or Chalk-with-flints. The Irish Chalk, instead of being a soft earthy rock like the Upper Chalk in the south of England, is a hard, compact, imperfectly-bedded limestone, breaking with a splintery fracture. Although not worked for building purposes, it is extensively quarried for lime-burning, and is known locally as "White Limestone." The White Limestone is covered by a thick cap of basaltic rocks, and the highly indurated condition of the chalk has frequently been referred to the effect of these overlying volcanic masses. Mr. E. T. Hardman, of the Geological Survey, has recently analysed the hard chalk of Tyrone, and does not find that its chemical composition differs from that of ordinary soft chalk. The Tyrone limestone contained 97.32 per cent. of carbonate of lime; it is notable, however, that it yielded traces of zinc, existing probably in the form of a carbonate, and derived from the superincumbent basalt. Flint nodules are distributed in parallel layers throughout the entire thickness of the Irish Chalk, and present the usual brown and grey colours, except at the junction of the basalt, where they are commonly reddened, as if by partial calcination. In some localities, as near Moira, the flints attain an enormous size, and some of the sponge-like forms, known as *paramoudras*, may measure as much as two or three feet in diameter. Fossils are not numerous in the Irish Chalk, but they afford sufficient evidence to show that it must be referred to a high geological horizon. Mr. Tate has suggested that the White Limestone may be paralleled with the Chalk of Norwich.

All the rocks previously described consist of sedimentary deposits, more or less altered. Yet the north-east of Ireland owes its chief geological interest to the splendid development of its igneous rocks. In addition to the dykes which penetrate the sedimentary strata, giving rise to more or less local alteration in the beds they traverse, great sheets of volcanic rocks, in some parts more than 600 feet in thickness, are spread over the surface of the chalk, and form a vast plateau occupying the greater part of the county Antrim, and extending into Londonderry. This basaltic group forms part of the great series of tertiary eruptive rocks, which stretch from the north-east of Ireland, through many of the Western Isles of Scotland, and reappear far to the north in the Faroe Islands and even in the older volcanic districts of Iceland. Professor Geikie has admirably described them, as developed in

some of the Hebrides. In Ireland they consist of successive sheets of old lava, superposed one upon another, and interstratified with beds of ash and deposits of lignite. The structure of the rocks may vary considerably, being tabular, columnar, concretionary, or amygdaloidal. When amygdaloidal, the vesicular cavities generally contain zeolites and other minerals. Although the finest example of the columnar forms is presented in the famous Giant's Causeway, yet in many other parts of the basaltic area the rock is more or less prismatic. In some cases the prisms or columns are jointed one to another by cup-and-ball sockets, of which splendid examples may be seen in the articulated pillars of the Causeway. Petrologically, the eruptive rocks of the Antrim plateau may be classed under the several varieties of *basalt*, *anamesite*, and *dolerite*—terms which are applied to one and the same rock according as its texture is compact, fine-grained, or coarsely-crystalline. Mineralogically, these rocks consist of augite, plagioclase—that is to say, a felspar in which the two principal directions of cleavage do not form a right angle with each other—and magnetite, associated with such accessory minerals as olivine and apatite. Professor Andrews, of Belfast, many years ago detected the presence of metallic iron in the Antrim basalt. It should be mentioned that the microscopic structure of the eruptive and crystalline rocks of Ireland is being carefully worked out by Professor Hull, who has already thrown much light upon this subject.

Whilst the basalts and their congeners belong chemically to the *basic* class of volcanic rocks, the correlative group of *acid* rocks, or those rich in silica, is not without its representatives in the north-east of Ireland; the rare rock described as a *trachyte-porphry* being found in patches near Hillsborough, and again at Tardree near Antrim.

That the Irish basalts were erupted after the deposition of the chalk is certain from their position; that they were erupted long afterwards is probable from the extensive denudation which the chalk must have suffered, as attested by the flint-gravels between the chalk and the overlying trap. But we are not left without a more direct clue to the geological date of at least part of this volcanic series. The subterranean activity was intermittent, and during the tranquil periods between the successive flows deposits of either a terrestrial or lacustrine origin were accumulated. Some of these interbedded deposits contain vegetable remains. In a cutting on the Belfast and Northern Counties Railway, at Ballypaddy, the basalts are interstratified with certain plant-beds, some of which have yielded a rich collection of fossil leaves. These have been carefully studied by Mr. W. H. Baily, the Palaeontologist to the Irish Geological Survey, who has detected among them a new fir-cone described as *Pinus Plutonis*, and the branches and leaves of a conifer, which he named *Sequoia Du Noyeri*. Other plant-remains have been discovered by Dr. J. Bryce, associated with the basalts on the shores of Lough Neagh. The Antrim flora, though

differing to some extent from that of the Isle of Mull, discovered many years ago by the Duke of Argyll, yet concurs with it in referring at least part of the basaltic series to the Upper Miocene period.

It is not only to the geologist that the Antrim basalts are a source of interest. Iron ores are associated in many localities with the volcanic series, and within the last few years these ores have attracted considerable attention. As early as 1790 the Rev. Dr. Hamilton described the occurrence of ferruginous ochres in the basalt of the Giant's Causeway, but no practical and systematic application was made of these materials until Dr. Ritchie, of Belfast, in 1861, commenced working the ochreous beds exposed in the railway-cutting at Ballypaddy. Other deposits of ore, of a different character, have been since discovered in many localities north of Belfast, and have led to the establishment of a new and important branch of industry, which promises to become of great value to the county. The Antrim iron ores have been described by Mr. Ralph Tate and Dr. Sinclair Holden, by Professor Hull, and by Mr. R. A. Watson. The lower part of the basaltic series contains interstratified layers of bole and lithomarge, which have evidently been formed by the alteration of the basalt. The bole is a reddish ferruginous clay, whilst the lithomarge is generally a bluish clay-like material, consisting of a hydrous silicate of alumina, potash, and peroxide of iron. The iron ore occurs in a band above the series of boles and lithomarge, and divides the basalts into an upper and a lower series. Much of the ore is pisolitic in structure, consisting of small spheroids of magnetite and haematite, embedded in an ochreous matrix. At Ballypaddy the ore is of a different character. From the high percentage of alumina in most of the mineral, it is brought into the market under the name of "Belfast aluminous ore," and has been largely used for mixing with the rich red haematites of Cumberland and Lancashire. The alumina acts as a flux to the silica, and even the lithomarge has been used for a like purpose. The Antrim ores have been also introduced into the blast-furnaces of South Wales, and some of the richer pisolitic ores, which may contain as much as 65 per cent. of metallic iron, have even been smelted alone.

Although the basaltic series of north-eastern Ireland attains in some places a thickness of more than 600 feet, and occupies an area of at least 1,200 square miles, yet there is abundant evidence to show that it was at one time much thicker and had a far greater extension than at present. The eruptive rocks at Scrabo Hill and at Dundonald, in the county Down, appear to be outliers of the great series of Antrim basalts, and stand out as witnesses of the extensive denudation which this district has suffered.

Traces of the action of ice are as clearly marked in the Belfast area as are those of fire. Glacial drift is spread over the greater part of the country; and the direction of the striae, still fresh on many a rock, together with the character of the transported blocks embedded in the boulder-clay, points to an ice-flow from the north and north-west. The deposits of drift around the

shores of Lough Neagh are celebrated for containing silicified wood, associated, in some cases, with lignite. It was formerly a popular notion that this was the wood of the holly-tree petrified by the waters of the Lough, but its microscopic structure clearly shows it to be coniferous. Some authorities have referred it to the genus *Cupressoxylon*, whilst others have pointed out its affinity with *Sequoia*. Dr. Macklosie suggests that, like the Antrim lignites, it may be of Miocene age.

Examples of the characteristic accumulations of drift, known in Ireland as "Eskers," may be seen in the long winding ridges of sand and gravel in the neighbourhood of Lisburn and Dunmurry. Terraces of old river-gravels occur in the valleys of the Lagan and the Blackstaff, whilst raised beaches are common along the coast. In some of these gravels worked flints have been discovered; and, in fact, as true chalk-flints are restricted in Ireland to the north-eastern corner, it might naturally be expected that such implements would be here peculiarly abundant. But the description of these relics of prehistoric man, though not without interest geologically, falls rather within the scope of anthropological science, and may therefore be fairly transferred to one of the Departments of Section D.

F. W. RUDLER.

IRANIAN ANTIQUITIES.

Iranische Alterthumskunde. By Fr. Spiegel. First and second vols. (Leipzig: Engelmann, 1871, 1873.)

In the different works which Dr. Spiegel has published during the last thirty years upon the language, literature, religion, and history of the ancient nations of Iranian race, he has elucidated so many obscure questions, and brought to light so many fresh facts, that the work which he has now given to the public may be regarded as the natural conclusion and summary of his preceding labours. The work is dedicated to Chr. Lassen, and is composed substantially upon the same plan as the *Indische Alterthumskunde*, though there are, of course, numerous and notable differences between the two books. Dr. Spiegel, like Lassen, has undertaken to reconstruct the social and political history of a country by means of fragmentary information and the scattered remnants of a literature; his task has not been less arduous, though it has been productive of less solid results: for if, on the one hand, owing to her geographical and historical position, Iran was better known to classical and Mohammedan writers who have added something to our knowledge; on the other hand, we are without such ancient native and authentic documents on matters relating to social life, religion, and literature as present themselves to the historian of India. Only fragments of the ancient literature of Iran have reached us.

It is needless to say that Dr. Spiegel has in general made use of all the documents bearing upon his subject, whatever their origin; but it is surprising to find that he has entirely neglected the information respecting Central Asia given in the Chinese annals, enough of which has been translated to enable us to follow the movements of the

Türanian people, whose destinies were for so long mixed up with those of the Iranian race. It is also to be regretted that the author has not taken more account of the illustrative monuments which the soil of Persia has yielded up in some provinces, such as the Bactrian and Indo-Scythian medals. To these omissions must be added a third, of still greater practical inconvenience. The author has not thought fit, before entering upon his subject, to give an account of the sources upon which he has relied. We can understand his having thought this to be superfluous, so far as the geography and ethnography of Iran were concerned, nor does our observation apply to that part of the work which relates to the mythical history, and which, in fact, begins by a paragraph headed "Quellen." But the exposition of the mythology and the religious system is not preceded by any indication of the materials by the help of which the author has composed this book, which, according to his preface, is not addressed to the learned only, but to the educated public in general. Yet some of his discussions are almost unintelligible without a preliminary knowledge of the works published upon the Avesta, and he evidently presupposes such a knowledge in his readers. Even though the author may propose to deal, in a future volume, with the sacred writings of the Iranians, the omission we have noticed is not the less objectionable in a work of this class.

The first volume of the *Eranische Alterthumskunde* is divided into three books, of which the first is devoted to the geography, the second to the ethnography, and the third to the primitive and mythical history of Iran. It terminates with an appendix, containing lists, furnished by modern travellers, of the different tribes now dwelling in Persia, such as the Beloochees, the Brahuis, the Hazâres, the Turcomans, the Khoords, &c., according to their tribes and families. The second volume includes the fourth book, which is devoted to religion; and the fifth book, of which the subject is the political history down to Alexander, with three supplementary dissertations: *a*, on the situation of the town of Pasargadae; *b*, on the rivers of Susiana, and the route followed by Alexander to Persepolis; *c*, on the province of Parthia.

The two first books are naturally based upon the corresponding portion of Ritter's great work, corrected and supplemented in many of its details by means of fresh researches and the reports of more recent travellers. The Arab geographers Yacût, Ictakhri, Kazwinî, and others have furnished valuable hints, but there is still something left for the gleaner. Among modern travellers, Sir Henry Rawlinson is most frequently quoted (his important geographical memoir was published in vol. x. of the *Transactions of the Royal Geographical Society*). The chapter which discusses the political division of Iran is preceded by a dissertation on the mythical geography of the Avesta and the Bundeshesh. The analogies of this cosmographic system with that of the Indians, as we find it in the *Mahâbhârata* and the *Vishnu-Purâna*, are too plain to be overlooked. Dr. Spiegel admits their existence unhesitatingly, but without pronouncing upon the origin of

the theories, though he maintains that they cannot proceed so far back as to the Aryan period. Comparing the system in question with the ethnographic, or rather topographic, outlines given in the tenth chapter of Genesis, he seems inclined to place the starting-point of these conceptions—half real, half mythical—at Babylon. In his enumeration of the provinces of the Persian Empire, the author follows, in chronological order, the lists of Darius in the cuneiform inscriptions, those of Herodotus, of Plato, of Ammianus Marcellinus, Moses of Khorni, &c. The advantages of a chronological order are so obvious that one is surprised that the author has not, as will be seen below, confined himself to this mode of classification in the other parts of his work. All this section is distinguished by admirable arrangement and clearness of exposition. The author has succeeded in giving, in a limited compass, a picture of the physical conformation and artificial boundaries of the country, which is complete in all its principal lines. A special map would have added still further to the usefulness of this portion.

The second book, as has been said, treats of the ethnography of Iran. All the populations actually inhabiting Persia and the adjacent countries are passed in review, and, so far as possible, shown to be historically connected with the different tribes mentioned in the ancient monuments. It is clear that many points must still be left uncertain in such a study, for the facts of ethnography are at present much less easily ascertained than the facts of geography. The private opinion of the observer too often plays the principal part in the examination of the elements to be estimated, and hasty conclusions are too often drawn from them. Thus, in the case of the tribe of the Tâdjiks, whom Dr. Spiegel (vol. i. p. 337), following an hypothesis of M. de Khanikof (*Memoirs on the Ethnography of Persia*, Paris, 1867), considers as the most pure and authentic descendants of the ancient Iranians, we must repeat what we have said elsewhere (*Revue critique*, 1867, ii. p. 373), namely, that the traveller quoted appears by no means to have proved his case. It is hard to admit that this people is still, and has been from comparatively remote times, designated by a name derived from the modern word *tâdj* (cap or bonnet), the rather that the word *tâdjik* in the Bundeshesh means Arabs. Dr. Spiegel, however, does not seem to believe this tribe to be identical with or related to the *Πάρικαι* (*Πάρικαι*) of Ptolemaeus. On the other hand, we cannot but commend the reserve which the author maintains towards ethnographical theories much in favour at the present day, both on the Continent and in England. We refer to the disposition to attribute the cuneiform inscriptions of the second class to the Türanian family of languages—a family of which the character and the limits are still undecided. It is dangerous to introduce new elements into science while they are still matters of controversy, especially when the conclusions to be deduced from them are of such wide significance.

The essay upon the primitive history of the Iranians begins by a *résumé* of the state of Indo-European society before the separation. The author then enters upon the Aryan period; that is, the one in which the

Indian and Iranian nationalities still formed a single people. He does not pronounce upon the question of their place of settlement, though it is one which appears to admit of an approximative answer, which he might have indicated without committing himself. The chapter in which he develops, in accordance with linguistic and mythological data, the series of ideas which the two nations have retained as the common heritage of their former kinship, is of great importance for the reader, since the author there explains the point of view from which he enters upon the general study of Iranian antiquity. The debates, to which the interpretation of the ancient religion of the Avesta has given rise, and the position occupied by Dr. Spiegel in this branch of science, are well known. Here as elsewhere he restricts the religious affinity of the two races to a certain number of divinities, whose primitive identity stares, so to speak, the enquirer in the face, such as Mitra, Indra, Soma, Gandharba, the Devas, &c., to some expressions relating to forms of worship (atharvan, hotar, yajna, mantra, &c.), and to several names which figure in the epic legends. He declares nevertheless (p. 438) that the beginning of a *religious system* common to the two peoples may be admitted at the Vedic period, but that the Aryan epoch had long passed away before the first Vedic hymn was composed (p. 445). The two branches of the Aryan nationality separated in their turn, constituting two distinct nationalities. Is it to be supposed that from this moment all relation between them ceased, that no influence was exercised, that nothing was borrowed on either side thenceforward? Dr. Spiegel seems reluctant to admit such after-intercourse except within the narrowest limits; though he insists particularly upon the reciprocal influence of the Iranians and the Semites, placing the beginning of these relations between the tenth and the eighth centuries B.C., during the early days of the separate existence of the Iranians as an independent people. An incontestable proof of the reality of these relations is furnished by the fact that the Iranians borrowed the cuneiform character from the Semites. However, as the most ancient monument of Persian writing is not older than the founder of the Achaemenian dynasty, nothing can be inferred from it respecting relations anterior to that epoch. Another proof of contact between the Iranian and Semitic races, according to Dr. Spiegel, is to be found in their interchange of cosmogonic theories. The analogies existing between the first eleven chapters of Genesis, the narratives of Sanchoniathon and Berosus on the one hand, and some passages of the Avesta on the other, have frequently been pointed out. Chaos, the creation by God, and the six periods of the Creation are supposed to have been conceptions borrowed by the Iranians from Semitic mythology; while the accounts of the creation of the first androgynous human being, of Paradise, &c., passed from the Iranians to the Semites. In short, Dr. Spiegel sees in the first narrative of Genesis a Semitic theory, in the second an Iranian theory borrowed by the Israelites, and he concludes with Movers (*Religion der Phönizier*, vol. i. p. 65), that the relations between the two races took place through the intermediary action of Babylonia and

Assyria, in the tenth century before our era. It is to be feared that this view will not meet with general acceptance. The categorical assertion of the author (p. 485) that the Iranians, at the time of these relations with the West, already formed a distinct and independent people, may be disputed at starting. Assyrian or Semitic influence may certainly have made itself felt at that primitive period, but there is nothing to prevent our supposing that this influence may have been restricted to a part (the western group) of the Iranian race, while the populations further east were still united in more or less close community with those of India. It is certainly important to ascertain whether the contact between the races in question took place once only or continuously; for, to say nothing of the possibility of the intercourse dating from a period still more remote than that fixed upon by Dr. Spiegel, it must be remembered that traces of the same myths are to be found amongst the Indians also.

The conclusions above-mentioned will probably undergo considerable modifications; they will be abandoned, resumed, corrected. But in the work before us, there is one part which will serve even now to constitute a solid base for the study of Iranian antiquities; that, namely, relating to the Heroic age of the inhabitants of Eastern Iran, and to the sources referring to it. These sources are comparatively modern, and belong, with the exception of the Armenian history of Moses of Khorni to the Mohammedan period; but they are certainly derived from earlier traditions, as they agree in general with the myths occasionally mentioned in the Avesta. There is little to be said about the chronicles of Hamza of Ispahan, of Tabari, of the Mujmil at-tawârikh, and of the fields of gold of Masûdi. The most important document is the national epic known as the Book of Kings. Dr. Spiegel has devoted almost a third of his first volume to the analysis and discussion of this work. Unfortunately the other Persian epics—the Bahman-nâmeh, the Gershasp-nâmeh, the Sâm-nâmeh, &c.—were not accessible to him in a complete form. We shall not attempt to analyse his analysis, but shall content ourselves with indicating the principal result that seems clearly established by it: this is, that the Book of Kings suddenly changes its character, without anything in the external arrangement of the text to indicate why, as soon as we reach the reign of Lohrasp. In this reign and the following ones, the narrative is dominated by religious and even theological pre-occupations, which are scarcely visible at all in the earlier parts of the book. This new aspect of the Heroic history is by no means limited to the person of Zarathustra. The antagonism between Irân and Turân becomes religious. Rustem, formerly the chief hero, is henceforward represented as addicted to Paganism, and is eclipsed by another hero, Isfendiâr. Simurgh, the bird of Providence, becomes a malevolent being. These discrepancies, and others of the same kind, prove that with the interruption of the ancient royal line of the Kayanides and the accession of a new branch in the person of Lohrasp, we enter upon a new cycle of legends. As to Zarathustra, it was easy to

foresee that the mass of legends, Oriental as well as Western, which relate to him and are passed in review by the author, would fail to furnish any certain information concerning either his person, his country, or the date of his existence. We are therefore not surprised, when at p. 710 the author concludes his long investigation by declaring only that Zarathustra was a real person (the opposite opinion has been put forward), because the Iranian religion reveals a well-digested and methodical system, which must have been the work, in its final shape, of a single man, "whatever his name may have been." But there is something still to be said on this subject. The analogies between the legend of Zarathustra and that of Çakyauni have not yet been studied, any more than the relations between Buddhism and Mazdâism. It is interesting in this respect to compare the account of Zarathustra in the Book of Kings; we know that the author of this episode of the Shâh Nâmeh was Daqiqi, and that Firdusi incorporated it in his poem, probably without alteration. The Buddhist elements apparent in the narrative, conjoined with the hostile attitude maintained towards Buddhism, seem to show, according to Spiegel, that its scene is placed in Bactria, where the Buddhist propaganda continued to make great progress from the first century B.C. to the Moslem conquest. It remains to be seen whether the Buddhist doctrines may not have existed still earlier in Iran.

Before continuing the account of the political history of Iran, the author in his fourth book treats of its religion. He shows first, by the perfect agreement of all our authorities, native or foreign, of whatever time or place, that there was a real unity and continuity in the religious system of the Iranians from the great reform of Zoroaster down to the Mohammedan conquest, notwithstanding the existence of some schismatic sects within the compass of the national religion. (We are not told precisely wherein Zoroaster's reform consisted). He declares next that he will describe this system first, before speaking of its origin, in order that the reader's judgment may not be biased. We are accordingly somewhat surprised at finding, as the first divinity of the Iranian system, the *Zervan akarana* (Infinite time), as if the ancient Iranians had created their religious system in accordance with all the rules of modern philosophy. There is nothing more dangerous than such logical edifices. Here, as in the study of language, the historical method is the safe high-road, which the investigator should never quit except under compulsion. It is not merely for the sake of harmony and the reader's convenience that the author has arranged the divinities of the Iranian pantheon in categories, as metaphysical divinities (*ausserweltliche Gottheiten*), &c.; he really believes that the Iranian religious system (it is rather a theological or philosophical system) was thus constructed. The passage of Damascius, quoted to prove that the Iranians considered space and time as chief divinities, has only a relative value; the evidence of the Bundehesh and of Mino-khired are too modern, and that of Firdusi is contradictory, even if they could be quoted for a question of religion. The author calls

these theories the fundamental ideas (*Grundanschauungen*) of the Iranians. We believe this to be a grave error, and that the Zervan belongs to the end of the theological development; which seems the more probable since this idea of infinite time, primarily only a philosophical speculation, became at length, though considerably later, at the time of the Sassanides, the starting-point of the doctrine and sect of the Zervanides.

With this reservation we can follow the author with interest through the enumeration and discussion of all the mythological figures in the religion of Zarathustra. No one would venture authoritatively to oppose his private opinion on such points to that of a scholar who has passed his life in the conscientious study of the sacred writings of the Iranians; dissent is possible with reference to the origin—Semitic, Egyptian, or Aryan—which the writer assigns to different mythological elements, but the warmest gratitude is due for the perfect candour and modesty with which his views are stated. He considers his own work not as the conclusion of the study of Iranian antiquities, but rather as the starting-point for such studies. We should wish to submit to him the following observation:—Dr. Spiegel, in asserting (p. 125) the priority of Ahura-Mazda to Agro-Mainyus seems to attribute the creation of the latter to a deliberate conception belonging to the theological system. In the face of this hypothesis, the counter-hypothesis of the existence of Agro-Mainyus before the reform of Zoroaster may be legitimately maintained. The author introduces us at once into the midst of the struggle between the good and the evil principle, and does not allow enough weight to the fact that the representative of the former had an individual existence before combining in his person the qualities we know, and that in all probability the same holds good of the second. *Conflict* is an important element in the dualistic theory, and this element is a great assistance to the inquiry into the origin of the Zoroastrian religion. When we consider that ancient Aryan divinities, like Indra and others, became the enemies of the creation of Ahura-Mazda, we ask why Agro-Mainyus alone should have been created all at once in his final character. But this question of the representative of evil is connected with the author's general system, who now, in opposition to his former view, is disposed to derive dualism not from polytheism but from monotheism, and accordingly connects the religion of Iran with that of the Semitic peoples in the west of Asia, where also he places the seat of the earliest speculations upon the origin of evil.

In the chapter devoted to some Iranian sects, especially the Zervanides and the Manicheans (the discussion relating to the latter is extremely thorough, and might be read with profit by theologians), we are surprised to find no mention of the Sabæans or Mandaites, who have preserved some writings of appreciable extent, in which the author would have found a considerable number of traditions, and more than one important parallel to the ancient doctrines of Iran, and especially to the speculations of the Zervanides and other sects. H. ZOTENBERG.

La Revue Celtique. Vol. ii., No. 2. June, 1874.

THIS number begins with a highly interesting article by H. Kern on "Germanic Names in the Latin Inscriptions of the Lower Rhine," especially those formed by the aid of the suffix *ha*, Indo-European *ka*, such as *VACALINEHIS*, *MAHLINHEIS*, *TEXTUMEHIS*. His identification of *teister* in *Teisterbant* with Lat. *dexter* is important as showing that the meanings of *right* and *south* once went together in the Germanic languages. Hitherto this was supposed to be the case only in Aryan and Celtic languages. Benfey long since suggested that the Sanskrit *dakshina* means at once *right* and *south*, simply because the Hindoos, in praying, stand facing the east, and so with the *south* on their *right* hand: our data now seem to warrant the conclusion that even the ancestors of the Indo-European family of nations did the same thing long before Hindoos, Greeks, or Celts were heard of. Then follows a valuable article by Mr. J. A. H. Murray on "The Present Limits of the Celtic Language in Scotland:" this is accompanied by a linguistic map, and the whole forms a supplement to Mr. Murray's work on *The Dialect of the Southern Counties of Scotland; its Pronunciation, Grammar, and Historical Relations*. Next come some "Etymological Scraps" by the present writer. The number of instances adduced he is now able here and there to increase: *eulon*, p. 193, should be struck out as being rather *eul-on*, perhaps, than *eu-lon*. A remarkable article, published nearly at the same time by Dr. Windisch in Kuhn's *Beitraege*, on "P in the Celtic Languages," touches also on some of the points here discussed; but the differences of opinion in the two are not very great. In his "Mythological Notes" Dr. Whitley Stokes points out, among other interesting quotations, the Irish counterpart to "the widely diffused legend of the Phrygian Midas and his ass's ears" in "Labraid Lorc and his ears;" he also gives extracts which explain the Irish view of Lycanthropy. P. 217, M. Havet points out that the history of Breton *ch* requires to be investigated. Pages 218-244 give us a further instalment of M. Sauvè's "Proverbs and Sayings of Lower Brittany," many of which are highly interesting. Breton ladies would not feel complimented by them. Passing by a number of notices and reviews—M. de Gaulle's on a "Supplément aux Dictionnaires Bretons," and the Editor's on O'Curry's "Manners and Customs of the Ancient Irish," are particularly well written—I come to a number of articles by M. d'Arbois de Jubainville, which deserve to be mentioned at some length on account of the many interesting points they touch upon. The first of these consists of very careful "Researches into the History of the Article in Breton." We are told that the base of the Celtic article is now agreed to be *smnda-*; more correctly it is of a Celtic article, namely, Irish and Breton *an*, for one fails to see how the O. Welsh article *ir*, now *yr*, can possibly belong to such a base. At any rate analogies should be produced, for it is hardly to be ignored in discussing the Breton article *ar*. Although the *r* forms cannot be traced so far back in written documents as those with *n*, I am inclined to think both must have been in the language from before the separation of the Bretons from the Welsh, unless we assume that a subsequent influx of Welsh settlers into the Vannes district brought our article with them. From the numerous names containing *ports*, Welsh *port*, "a gate," and the like, which the writer quotes, I gather that he could give us the full history of Breton *z* = Welsh *th*. Page 276 shows several rapprochements, against which I must enter a gentle protest. The first is that of Welsh *gwyn*, "white," with Goth. *hveit-s* and Skr. *çvid*, *çvindati*. Now this is phonologically impossible, and one must, I think, be content with referring *gwyn* to the root *VID*, "to see,"—it would take up too much space here to show that *gwyn* may have at first had some such meaning as "spectatus," or fair. Compare *Duo gwyn*, "der liebe Gott," *tad gwyn*, respectful for

llysdad, "stepfather," with a similar use of *balta-s*, "white," in Lithuanian. As to Sanskrit *ghora* being of the same origin as Breton *garw*, Welsh *garw*, "rough, not smooth," Benfey derives the former from *ghur*, which, according to the Pet. Dic. means "durch Geschrei erschrecken; in der Noth schreien," so that the meanings are too different; nor is it of any use to fall back on Welsh *tarw*, "a bull" and Latin *taurus*, for why should not *tarw* = *star-va-*, to be compared with Skr. *star-i*, "vacca sterilis," and Greek *στειρός*, *στεριός*? Similarly, why should *llanu*, "full tide," be a metathesis of *llawn*, "full," rather than be supposed to stand for *llawen*, just as we have Breton *ana-vébot*, Welsh *adna-bod* for the older form *atgnau-bot*, "to know"? M. d'A. de J., in speaking of Goth. *bi*, Skr. *abhi*, and Gaul. *ambi*, forgets O. Welsh *be* in *be-het*, "as far as," in the Lichfield Codex, and does not say why he regards Irish *corp* as not from Lat. *corpus*. Irish *fodail*, "division," p. 277, is probably to be written *godail*, as the Welsh is *gwaddawl*, "a dowry;" cf. O. Welsh *didaul*, "expers." The writer would fain equate (p. 284) Breton *aoten*, Welsh *ellyn*, "a razor," with (O'Reilly's) Irish *artinne*, "a flint;" but the Irish word in point is *altain*, *scian bertha* (O'Davoren), and it can hardly be said that anything has been proved respecting the Gaulish flint-razor which he infers, and which promises us a curious insight into the nature of ancient beards. Lastly, the reader will understand that the above foibles would not have been here mentioned were it not that they occur in writings of great merit. JOHN RHY.

NOTES AND NEWS.

WE hope to give in our next number a full report of Professor Tyndall's Presidential Address at the meeting of the British Association at Belfast.

Acinous glands of the Tongue.—V. Ebner, in a pamphlet recently issued, describes a series of small glands chiefly situated near the back of the tongue in man and mammals. They are best seen in guinea-pigs, and consist of an excretory duct lined by a single layer of epithelium and opening out into a series of alveoli resembling those of the pancreas. The fluid secreted is peculiar in containing no mucin. The glands have accordingly been termed *serous* glands.

Movements of the Oesophagus.—These have recently been investigated by Signor A. Mosso (*Giornale della R. Accademia di Torino*), and several important points made out. Under ordinary circumstances the contraction commencing in the fauces is continued to the cardiac orifice of the stomach in a peristaltic manner, as is well seen in a horse or giraffe drinking, and it has sometimes been supposed that it is propagated by contact of one muscular fibre with that adjoining it. Mosso disposes of this theory, however, by showing that a ligature may be applied to the oesophagus, or it may be cut across with a knife, or a moderate sized piece may be absolutely removed. Yet the peristaltic movement will still be propagated. Section of the spinal cord just below the medulla has no effect, nor is any effect produced by irritating the coeliac ganglion, or the cervical ganglia of the sympathetic or the hypoglossal, facial, glossopharyngeal or accessory nerves. On the other hand, movements can be immediately called forth by irritating the pneumogastric, whilst section of the pneumogastric paralyses the oesophagus. Hence Mosso maintains that the peristaltic movements of the oesophagus start from some excitation of the fauces, which is carried by sensory nerves to the medulla oblongata. Here there is a reflex centre, and this sends forth a series of impulses which cause a succession of co-ordinate movements in the oesophagus, following one another from above downwards. Mosso finds that if the pneumogastrics be divided the peripheral stump retains for several days its power of exciting contractions in the oesophagus—a very unusually long

period—and in like manner the oesophagus long remains excitable after death, if preserved in a moist chamber (4½ hours in dogs and 30 hours in cats).

Nervous System of Actinia.—A paper on this subject, respecting which there has been much discussion, appears in the *Monthly Microscopical Journal* for August, from the pen of Professor Martin Duncan. An account is given of the observations of Howard, Haime, Schneider and Röttken. Professor Duncan worked chiefly upon the actinia mesembryanthemum, and remarks upon the various difficulties that accompany the enquiry—the irritability of the muscular tissue, the variety of cellular histological elements, and the slimy character of the whole mass. It is difficult also to make thin sections. On examining the *chromatophores* he finds an outer bacillary layer consisting of sausage- or bolster-like cells, arranged vertically and separated from each other by a delicate layer of protoplasm. Beneath this is a little granular protoplasm containing small cells; then comes the second layer, which is composed of large transparent colourless and highly refractile cells. In addition to these structures are the cones of Röttken, or the nematocysts with imperfectly visible threads of Howard. Some of these are elongated simple cells, faintly tinted, with tough cell wall and rather viscid contents; others have a faintly striated cell wall, and others again have a well-developed thread developed in their interior. The tissue between them is granulo-cellular protoplasm, and this often presents a filiform and branched appearance. Besides all these, Röttken described fusiform cells and fine fibres, which he believed to be rudimentary nervous system, and in this view Professor Duncan is disposed to agree. He points out the difficulties of regarding the chromatophores as organs of special sense, since they are sometimes present, sometimes absent, in nearly allied genera; still he thinks they may be regarded as the first faint outlines of eyes. He finds certain plexiform fibres at the base of the actinia.

Abiogenesis.—Huizinga in a paper published in Pflüger's *Archiv*. (Band viii. p. 551) opposes the statements of Samuelson and Burdon Sanderson, and adheres to his own previously expressed views, which are in favour of the origin of organisms without the co-operation of pre-existing organisms, in other words, in favour of spontaneous generation. He objects to the employment they made of hermetically sealed tubes containing but a small amount of air, a condition which is unfavourable for the development of life. He himself used septa and corks, if they may be so called, of porous earthenware. He exposed the fluids he experimented with to a temperature of 212° F. or a little above which he believes killed all organisms and their germs. Notwithstanding this he found Bacteria in a mixture of potassium nitrate, magnesium sulphate, calcium phosphate, starch, peptones, and grape sugar. When such a mixture was exposed to a temperature between 220° and 230° F., however, no Bacteria appeared.

The Sense of Rotation.—Dr. Crum-Brown, in the last part of the *Journal of Anatomy and Physiology*, states he has for some time past been convinced that we possess a sense of Rotation quite distinct from all our other senses. By this means we are, he thinks, able to determine—(1) the axis about which rotation of the head takes place, (2) the direction of the rotation, and (3) its rate. The experiments he has made were conducted by placing a stool on the centre of a table capable of rotating smoothly about a vertical axis. Upon this the experimenter sat, his eyes being closed and bandaged. An assistant then turned the table as smoothly as possible through an angle of the sense and extent of which the experimenter had not been informed. It was found that with moderate speed, and when not more than one or two complete turns had been made at once, the experimenter could form a tolerably accurate judgment of the angle through which he had

been turned. By placing the head in various positions, it was possible to make the vertical axis coincide with any straight line in the head. Considerable differences of accuracy exist in different individuals. The explanation given by Professor Crum-Brown is that each canal has an ampulla at one end only, and there is thus a physical difference between rotation with the ampulla first and rotation with the ampulla last; and we can easily suppose the action to be such that only one of these rotations (say that with the ampulla first, in which case of course there is a flow from the ampulla into the canal) will affect the nerve-terminations at all. One canal can therefore, on this supposition, be affected by and transmit the sensation of rotation about one axis in one direction only; and for complete perception of rotation in any direction about any axis, six semicircular canals are required in three pairs, each pair having its two canals parallel, or in the same plane, and with their ampullae turned different ways, and this is just what is found in all animals he has examined that have the exterior canal of one ear very nearly in the same place as that of the other, while the superior canal of one ear is nearly parallel to the posterior canal of the other.

DR. HERMANN KLEIN, writing in *Das Ausland* on the sun, speaks of the discrepancies in various measurements of the solar disk. Hansen finds its mean semi-diameter $16' 0.9''$; Greenwich observations from 1854-65, $16' 1.15''$; and declination measures $16' 1.27''$, or as a mean $16' 1.2''$; Maz-zola, of Turin, as a mean of 75 measurements between February 7, 1816, and July, 1873, $15' 58.65''$. Dr. Klein observes that this result is not founded on sufficiently numerous observations to have any decisive weight. Spörer first suggested that there might be a periodical variation in the sun's diameter, and Secchi thought the great commotions to which our luminary is subject might affect his dimensions, the longest diameter being found when spots and protuberances were least numerous.

A WRITER (E. D. C.) in the *American Naturalist* mentions a snake from the Amazonian regions of Peru, in which the spines of the dorsal vertebrae are so dilated at the summit as to present a series of bony plates along the middle line of the back homologous with the central pieces of the shield of a tortoise. It is named *Genhosteus prosopis*.

It appears from the same journal that the English sparrows introduced a few years ago in Germantown, Pa. have greatly multiplied and are driving away the native robins, blue-birds, and sparrows, which are compelled to seek quarters elsewhere. So far as they succeed in displacing the native birds they will illustrate "natural selection" or the "survival of the fittest."

At a recent meeting of the American Philosophical Society the greater part of the mandible of a large extinct hog of the genus *Elotherium* was exhibited. It was referred to the *E. ramosum*, Cope, and the animal to which it belonged is described "as having been as large as the Indian rhinoceros, and furnished with two osseous tubercles on each side, the front pair standing on the chin and projecting into horns of much strength."

THE Rev. C. Harvey, under the title of "Rabies Mephitica" in the *American Journal of Science*, describes the bite of the skunk as nearly always fatal from the character of its salivary secretion, which is poisonous either from a common disease, or its normal state. The skunk, he says, is much dreaded in the Western States, as it is a nocturnal animal, and bites without warning.

THE *American Naturalist* states that, for the last two years, several counties in Minnesota and Iowa have been so devastated by grasshoppers that the settlers are impoverished, and the earth is now so full of grasshoppers that it cannot be tilled for at least a year. A bill has been passed

by Congress permitting the settlers in all these countries to abandon their land for one year, without prejudice to their rights under the pre-emption laws, so that they may support their families elsewhere.

No critic of Darwin has more thoroughly presumed upon his readers' ignorance of the writings of the great naturalist than M. Emile Blanchard in the *Revue des Deux Mondes*. Passing entirely over the vast body of facts cited by Mr. Darwin, he fixes his attention on one or two hypothetical cases adduced for the purposes of explanation, and pretends that the theory of natural selection is entirely based upon idle dreams. M. Emile Blanchard is one of those reviewers who avoid prejudicing their minds in an author's favour by reading his books. Had he done more than make a few hasty dips in the *Origin of Species* he could not have made the foolish mistake of asserting that Darwin upsets his own system by affirming that natural selection, or the survival of the fittest, does not necessarily imply indefinite progress. The lower creatures, which M. Blanchard absurdly supposes ought, according to the theory, to be displaced by those above them, live on in perfect accordance with it, because they are the fittest to survive under the circumstances. M. Blanchard himself is, zoologically considered, very superior to creatures who live in the internal organs of others, but quite unable to fight a battle of life under their conditions.

OUR readers will hardly have forgotten that four years ago Dr. B. A. Gould left Boston on a visit to the Argentine Republic, for the purpose of supplementing in the southern hemisphere the work of cataloguing the stars, and thereby completing the operations carried out by Bessel, Argelander, Carrington and others, which have for the most part been confined to the northern heavens.

The special zone which Dr. Gould selected was that extending from 31° S. to the northern limits of the zone studied by Gilliss at Santiago, but of which the results have not yet been published.

President Sarmiento who had already lent a willing ear to the proposals of the northern astronomer, when he was acting as Argentine Minister at Washington, lost no time on his accession to the Presidency of the Republic in carrying his intentions into effect. Accordingly, in the year 1869 Dr. Gould received his commission and finally reached Buenos Ayres in August 1870, accompanied by the warmest wishes of all astronomers for the success of his enterprise. The locality chosen was Cordoba, but the observatory was not completed for the regular star search until September 1872: meanwhile the two years were well employed in determining the brightness of all the visible stars in the southern hemisphere.

The observations were carried on by the aid of three assistants, and Dr. Gould has now returned to discuss and publish the results of what he has termed his *Uranometria Argentina*. He gave an interesting account of his experiences and of the scientific prospects of the Argentine States, in a lecture delivered in Boston, by invitation, on June 22.

PROFESSOR F. A. MARCH has printed in a separate form his argument against Mr. Henry Sweet's hypothesis of the formation of the flat and sharp Anglo-Saxon and English *th* from an original *t*. Mr. Sweet's series is *t, d, dh, th*, in which Professor March finds the passage from *dh* to *th* against all law; and he supports against it, Grimm's series *t, th, dh*. As against Mr. Sweet's view that in Alfred's time there was only one sound, *dh*, for the two characters *ð* and *p* (each of which is used alone by different scribes), Professor March contends that phonetic laws show that both the sharp (*thin*) and flat (*thine*) sounds existed, though old scribes used but one letter (some *ð*, some *p*) for both sounds, just as we now use *th*.

MEETINGS OF THE WEEK.

LONDON AND MIDDLESEX ARCHAEOLOGICAL SOCIETY.

ON Tuesday, August 11, the members of this society held a general meeting at the palace of the Bishop of London, at Fulham. The chair was taken in the hall of the palace at one o'clock by the Bishop, who opened the proceedings by a speech expressing his interest in archaeological pursuits, and his regret that his duties prevented him from attending the meetings of the Society.

A paper was then read by the Rev. F. G. Blomfield, Vicar of St. Andrew's, Undershaft, detailing the history of the palace, of which the following inscription in the hall is a brief epitome:—"This hall, with the adjoining quadrangle, was erected by Bishop Fitz-James on the site of the buildings of the old palace, as ancient as the Conquest. It was used as a hall by Bishops Bonner and Ridley, during the struggles of the Reformation, and retained its original proportions till it was altered by Bishop Sherlock in the reign of George II. Bishop Howley, in the reign of George IV. changed it into a private unconsecrated chapel. It is now restored to its original purpose in the erection by Bishop Tait, of a new chapel of more suitable dimensions. A.D. 1866."

Even before the Norman conquest Fulham was connected as a residence with the bishopric of London, as the Manor House was built by Earconwald, who was consecrated in 674. The moat which surrounded the palace was believed by Mr. Blomfield to be the work of the Danes.

The Rev. E. H. Fisher, vicar of Fulham, contributed an account of the parish church, where many of the bishops of London since the Restoration are buried, and which is chiefly remarkable for its fine peal of bells, and communion plate, the chalice being of gold.

The Society had intended to visit Chiswick Church, but owing to the state of the tide, the steamer in which they had journeyed from London could not land. The members therefore contented themselves with the interesting account of the parish furnished by the Rev. L. W. S. Dale, in which he referred to the many distinguished people during the last two centuries who have been connected with the place.

FINE ART.

Notes on Japanese Art. By George Ash-down Audsley. Illustrated by Specimens of Japanese Art, from the Collection of James L. Bowes, Esq. (Liverpool: printed for Private Circulation, 1874.)

THIS work consists of an analytical catalogue of the Oriental Exhibition of the Liverpool Art Club, held in December 1872, illustrated with photographs of great clearness and beauty, and prefaced by a preliminary dissertation on Japanese Art by the editor, Mr. Audsley.

The majority of the specimens exhibited were derived from the rich collection of Mr. and Mrs. Bowes, of Barnard Castle and Streatham Castle, which, since the recent death of Mrs. Bowes (Countess of Montalba), has become the property of the inhabitants of the town of Barnard Castle, to whom she bequeathed it, with the palatial building designed to contain it, and the park belonging to the property. This collection consists of paintings, statues, ceramic and other works of art, and has been formed by Mr. and Mrs. Bowes during a long series of years. The collection of Japanese and other enamels is perhaps unrivalled. It will be some years before the museum will be

thrown open to the public, so great is the amount of carving and ornament to be done. Mrs. Bowes has desired that her remains shall repose in a chapel erected near the building, which is to be styled, after its donors, the "Josephine and James Bowes Museum and Park."

But to return to the collection.

It is only of late years that Japanese art has emerged from the seclusion in which it has been hitherto hidden, or that we have learned to separate it from the Chinese, with which it has been hitherto confounded, and from which it essentially differs, being in many points greatly superior.

No nation has a more lively perception of art in all its forms than the Japanese, none is so skilful and delicate in manipulation, or so free and accurate in their drawing. By simple means they produce the most beautiful and expressive results, or, where more elaborate workmanship is required, there is nothing hard or laboured in the execution.

Their tools are few and simple; but they give to their work a dexterity of hand and correctness of eye which they obtain from long practice, and also that of which the European is so chary—the time necessary for its execution.

In the delineation of natural objects the Japanese excel; flowers and birds are their favourite subjects. To the graceful bamboo with its delicate foliage and jointed stems, or the slender grasses of the field, they impart all the elegance of nature; while the more important flowers—the iris, chrysanthemum, convolvulus, or lily—they exhibit in all their state and richness.

In portraying birds the Japanese take special delight; the stork, emblem of longevity, is one of their favourite objects; and the duck, pheasant, falcon, cocks and hens are all evidences of their skill in drawing birds.

The Foo, the Fong-hoang of the Chinese, a sacred immortal bird, which only appears to announce prosperity to mortals, is represented with brilliant plumage decorated with the richest tints, its tail resembling in character both that of the argus pheasant and the peacock, and we find it generally associated with the symbols of the sovereign. The dragon, too, as in China, takes a prominent part.

The sea-tortoise, with an appendage like a tail, but which is probably only a kind of nimbus, it being one of the sacred animals, is often represented.

Golden carp, with their triple tails, and another fish, probably of the salmon tribe, ascending a waterfall, insects, shells, every object of animated nature we find portrayed.

In inanimate nature the waves of the sea, rocks, and the sacred mountain Fusignama, an extinct volcano whose snow-clad peak is seen from the suburbs of Yeddo, are common objects upon porcelain and lacquer work.

Most of the pieces reserved for the Mikado are painted with his insignia or crest, the *guik-mon* or the flowers of the chrysanthemum, and the *kiri-mon* or leaves and flowers of the *kiri* (*Paullownia imperialis*), which latter is more particularly the official ensign or mark of power.

The collection of Mr. Bowes is divided

into several sections: enamels, lacquer, porcelain, metal and carved work.

The enamels amount to one-fourth of the collection, and comprise, perhaps, the most valuable part. The only kind of enamel Japan appears to have produced is the cloisonné, worked after the manner of those of the Middle Ages, as described by the monk Theophilus; but those of European workmanship which have descended to us are of small size, whereas the Japanese vases are some of them three feet high, and the dishes two feet in diameter, marvellous in their variety and intricate execution, and in the manipulative skill displayed. In colouring, the Japanese enamels are as sober as the Chinese are bright; the principal colour used for the ground is a dark green, but lilac, drab, and dark blue are employed for that of the medallions, and introduced in the design. So fine is the workmanship, that Mr. Audsley states that in a diaper pattern most difficult to put together, he counted 103 squares in a quarter of a medallion of only one inch and a quarter radius, each of these squares having to be shaped out of the fine ribbon or filagree wire which forms the cells, and soldered one by one to the ground of the object, after which the enamel has to be fixed in these receptacles: this will give some idea of the difficulty of the cloisonné processes. One of the characteristics of Japanese enamel is its great thinness, it being done on beaten copper, pieces enamelled on both sides not exceeding the sixteenth of an inch in thickness. The Chinese enamels, on the other hand, executed on beaten copper, are excessively heavy, and, departing from the low-toned colours they originally used, they seem gradually to have increased their vividness until they reached the crude, garish colouring of modern importations. In the manipulative skill of their cloisonné enamels the Japanese artists have reached their acme. Vases of this collection are of magnificent design and workmanship, the surface covered with minute diaper or scroll work with medallions on which are depicted three-clawed dragons fighting with eagles and storks, or perched upon a branch of the *kiri* or *Paullownia imperialis*. It is only of late years that these choice pieces of cloisonné enamel have been obtained, and it would almost appear, from the insignia they bear, that the art was dedicated exclusively to productions for the use and ornament of the palaces of the Mikado and the princes of the land. The feudal system in Japan being now a thing of the past, the *Daimios* have broken up their princely establishments, selling all the art works which had been made for their express use and been handed down from generation to generation. As the period of their first importation into Europe coincides with that of the political changes in Japan, this probably will have been the case, and will account for their sudden appearance.

In ceramic art we must confine our notice to the two kinds of most recent introduction into Europe, the Satsuma and Kaga wares.

The delicate buff faience of Satsuma is produced in the south-west of the island of Kiu-siu; its date is unknown, but it is distinct from all the other wares of Japan. So highly

is it valued in Japan, that a piece is here exhibited with the box which contained it and the silk handkerchief in which it was enveloped. The old ware, such as was seen at the Paris Exhibition of 1867, is rarely met with, all that comes over now bearing evidence from its coarseness of having been made for the European market.

The Kaga ware has not yet been so deteriorated. Made in the north-west of the island of Nippon, it is a ware peculiar to itself. It is highly valued in Japan, and little finds its way out of the country. It is painted of the richest red, with much elaborate ornamentation relieved by gilding, generally with medallions. It is almost always marked in Japanese characters signifying Kutani, "The Seven Valleys," site of the porcelain factories of the Prince of Kaga.

Of countless variety and endless modes of manufacture is the lacquer work of Japan. It is unusual to find more than one style on the same piece, but in the various methods of applying the gold work, the treatment of different metals, the coloured and aventurine lacs, the pearl, ivory, coral, gold, silver, and other inlays used in the art, no manufacture exhibits such diversity. Years are occupied in its completion, and lacquer is applied by the Japanese to all the materials used in ornamental work—wood, ivory, tortoise-shell, mother-o'-pearl, and even porcelain.

Ivory carving, metal work, and embroidery complete this unrivalled collection, in which the student has full opportunity of studying in its finest examples Japanese art, which, like that of all Oriental nations, has succumbed to European influence. Art exists no longer—all is modified to the taste of the trader. Compare only the charming works exhibited in this collection with the rude porcelain, the coarse Satsuma ware, the vulgar lacquer work which now inundate our shops, and we must admit that Japan has miserably departed from her ancient traditions, and that the opening of her ports to the stranger has given the death-blow to Japanese art.

F. BURY PALMER.

THE DORÉ GALLERY.

RECENT visitors to this gallery—and they appear to be numerous from day to day—have had the opportunity of examining three more pictures from the hand of the over-prolific French genius. The most important of these is the *Massacre of the Innocents*, which indeed may be regarded as about the most vigorously and pictorially portrayed of all Doré's pictures, competing in this respect with the well-known subject (which, however, is considerably smaller) named the *Neophyte*. As usual, he treats the *Massacre of the Innocents* with remarkable power of vivid conception and forceful realisation. The principal group presents the desperate frantic struggle of a noble-looking mother with three soldiers, one of whom holds her infant aloft, prepared to slaughter it as soon as a moment's respite from the human tigress shall be allowed him; for the mother is at this moment a creature of mere sex and maternity, hardly of womanhood. The general posing of this group, in slanting and sidelong attitudes, enhances the sense of effort and confused struggle. Another group, less salient to the eye, has greater strength of dramatic meaning. Here a mother entices a soldier to allow her to smuggle away into concealment the cot wherein her baby lies ensconced; the slaughterer understands the meaning of her fiercely caressing eyes and convulsive leering

lips, and seems more than half minded to earn the proffered remuneration for a moment of mercy, and spare one victim out of the many doomed by King Herod. This picture reminds one not a little of some of those which the powerful-minded Belgian painter Wiertz produced, and which now constitute the Wiertz Museum in Brussels.

A minor canvas, crowded with small figures, is named *The Soldiers of the Cross*. Here M. Doré has chosen a great and interesting historic subject, well suited to make a picture. One of the crusading armies is represented as on its march towards the Holy Land, crossing a rugged mountain-country. At vespers the cross is borne in solemn procession; some warriors kneel before its passage; the mass of the army salute the symbol of redemption with their upraised swords; friars flit into and out of the ranks, exhorting, inciting, and comforting; afar the host stretches and straggles, always advancing, never receding. This painting, considered from an executive point of view, can only be regarded as a facile and effective sketch.

The third production, *Midsummer Night's Dream*, is simple rubbish: it represents a fairy revel. There is in it as little of ingenious or original fancy as of natural effect; and no more strongly privative term need be used by a person who has looked at this mode of painting moonlight, and the verdure under its influence. Almost the sole point deserving individual mention is that M. Doré has borrowed from Landseer's picture of *Titania and Bottom* the white rabbits with pink eyes; and, in borrowing, he has spoiled them by giving them a pretentiously ghostlike air. This slovenly sketch ought not to have been painted, still less exhibited. W. M. ROSSETTI.

NOTES AND NEWS.

A CURIOUS archaeological discovery has recently been made at a church on the outskirts of Rochester. We use the word "discovery" advisedly, for few would have imagined in passing the plain brick structure of methodistical aspect, now used as the chapel of St. Bartholomew's Hospital, that it held an interesting old Norman Church imbedded within its walls. It would seem as if some one must at some time have taken infinite pains to cover up and alter every portion of the old building, so completely is it hidden from sight. When visiting this remarkable church a few weeks ago, we were told that it was formerly divided and let off in cottages, an upper floor and staircase having been added inside. On the outside the old stone wall has been neatly covered with brickwork, and square windows pierced instead of the old round arched ones. Some years ago, however, these cottages were all cleared away, and the poor church, after submitting once more to the indignity of plaster and whitewash, was restored to its original use. Divine service is now performed in it every Sunday. In the prevailing passion for church restoration it is not surprising to find that one or two local archaeologists have remembered this buried relic of Norman England, and have made researches that have led to most interesting results. The original church of St. Bartholomew is known to have been built as early as 1085-87, by Hugh de Trottesclive, a monk of Rochester. Several portions of this ancient building are still in a good state of preservation, and Sir Gilbert Scott, who has been referred to respecting the possibility of its restoration, has spoken of it as being "valuable and interesting beyond expression." He caused two of the windows in the nave to be pierced, and found all the stonework of the jambs perfect; some portions of the woodwork roof of the fourteenth century he also discovered to be still remaining. His opinion respecting its restoration has not yet been given.

We were led to visit the Church of St. Bartholomew on account of its curious archaeological interest, but a further source of gratification was

unexpectedly revealed in some beautiful modern wall-paintings that have been executed in a loving spirit and with great artistic skill, in the apse at each side of the east window. They are the work of an amateur artist, Mr. Stephen Aveling, of Rochester, who must, it would seem, have painted them, like some good monk artist of old, for the glory of God and St. Bartholomew; for few, it is to be feared, will be able to make acquaintance with these works in the out-of-the-way little church in which they are painted. The subjects depicted are the Baptism and the Ascension of Christ, subjects conceived by the artist completely in the spirit of the early Italian masters.

The exhumation of the Norman church is, we believe, mainly due to the exertions of Dr. Bailey, the master of St. Bartholomew's Hospital in Rochester, and Mr. Aveling.

AN exhibition of the works of the late painter Gleyre, comprising all his works at present in Switzerland, opens to-day in one of the galleries of the Arland Museum at Lausanne. It will remain open till September 15.

THE Archaeological Congress, in meeting, elected Count Henning Hamilton to be President, and Drs. Hildebrand, Nilsson, De Quatrefages, Franks, Virchow, Dupont, Leemans, and Bagdanow to be Vice-Presidents.

THE municipality of Copenhagen has finally decided to present the town of Reykjavik, in Iceland, with a replica in bronze of Thorwaldsen's statue of himself, in his working dress, leaning against the figure of Hope, as a memento of the Thousand Years' Feast.

A CENTENNIAL celebration of the discovery of oxygen by Dr. Priestley was held on August 1, at Birmingham, when a statue of the great philosopher and chemist was unveiled by Professor Huxley. The statue is supposed to represent Priestley as he stood in Lord Shelburne's garden at Bowood on the memorable August 1, 1774, holding in his hand the burning-glass with which he concentrated the rays of the sun on the calx or oxide of mercury, and so produced oxygen. The burning-glass, as Professor Huxley pointed out, is reduced to aesthetic proportions in the statue, but the incident is otherwise represented accurately enough, and the old-fashioned costume, with its wig, ruffles, knee-breeches, and buckles on the shoes, is faithfully rendered. The statue is of white Sicilian marble, 8 ft. 6 in. in height, and is the work of Mr. F. J. Williamson, a pupil of Mr. Foley. The site chosen for it is one of the best in Birmingham, namely, the large open space between the Town Hall and the new Corporation buildings.

Apropos of the contemplated removal of the Monument, the *Builder* of last Saturday has a well-considered article on "Our Public Monuments and their Position." It points out the Thames Embankment as a suitable position for such works, which the writer considers would have a finer effect if concentrated at one place than as now dispersed and isolated. The impressive effect produced by the avenues of sphynxes leading to the Egyptian temples might in this way be happily imitated.

THE fourth exhibition of the Union Centrale des Beaux-Arts was opened last Monday at the Palais de l'Industrie. The Society of the Union Centrale has lately been reconstituted, and the present exhibition inaugurates its new administration. The official programme states that it has been organised:—

"1. With the view of maintaining the culture of those arts which have for their object the utilisation of the beautiful; 2. Of aiding the efforts of men interested in the progress of national industry; 3. Of exciting emulation in works that popularise the sentiment of the beautiful, ameliorate public taste, and tend to preserve our art industry in its old and just pre-eminence over the whole world."

The exhibition is divided into three distinct groups:—1. *Modern Works of Art executed with a View to Industrial Reproduction*, comprising, art applied to the decoration of the dwelling; to the hangings of the dwelling; to the furniture; to the useful metals; to metals and costly materials; to pottery and glass; to clothing materials and materials for domestic use; to divers articles; to the teaching and popularisation of art. 2. *The Works of the Pupils in the Art Schools of Paris and the Departments*; and 3. *The Retrospective Exhibition*, previously mentioned in the ACADEMY, which has been especially organised to illustrate the history of costume from antiquity to the end of the eighteenth century. This last "group" as being the most novel, will not fail to be the most attractive portion of the exhibition. The costumes as far as possible are original, but they are also set forth by documents and pictures of all kinds, and even plastic art has been called into service. To students of the social life of the Middle Ages, this costume-history will have great interest, and directors of theatres and votaries of masquerade will no doubt avail themselves of such a splendid opportunity for "getting up" costumes with historical correctness.

A VERY fine and complete series of photographic views of Pompeii is being exhibited in Paris in the Salle des Conférences on the Boulevard des Capucines. They have been taken by an Italian artist M. Giacomo Luzzati, and are distinguished by the extreme boldness and sharpness of their relief. In looking at them we seem to be walking among the actual ruins of the long buried city.

SIR RICHARD WALLACE, the *Chronique* states, has made purchases to the extent of 280,000 francs at the Salon this year.

KARL VON PILOTY, as everyone would have expected, has been appointed director of the Munich Academy in place of Kaulbach. Gottfried Semper, who was recently appointed Oberbaurath by the Emperor of Austria, has now been made companion of the Prussian order of merit.

Two painted glass windows have been recently exhibited in the Royal Glass Manufactory at Munich, that have been executed for a church at Darley, near Glasgow. They are spoken of by German critics in high terms of praise.

IN the *Portfolio* for this month Mr. Beavington Atkinson seeks to open what he terms "a new line of enquiry touching a problem which, though under debate for many centuries, still awaits solution." Theories of the Beautiful have occupied many philosophers, but they have sought the abstract idea of Beauty, and have not generally been gifted with the artistic perception of it. "The Witness of Artists to the Beautiful," the subject of Mr. Atkinson's paper (the first, apparently, of a series) is, therefore, important, for art endeavours to embody the Beautiful, and artists are unconscious witnesses to it, the office of the artist being "not to define Beauty in its essence, but to give it a bodily manifestation." "Notes on the Movements of Young Children" is the subject of an interesting article, by Robert Louis Stevenson, but we cannot agree that the pathos and humour of these spontaneous and imperfect movements cannot be rendered by art. Surely Sir Joshua Reynolds's children have all the touching if clumsy grace of childhood, and are not the least beautiful creations of his art.

The etchings of the number are Turner's "Fighting Téméraire," etched by Rajon, printed in a brown sepia colour, and an etching by the Russian amateur, M. Massaloff, of a portrait by Rembrandt.

WE regret to learn that two pictures by Rubens have been injured by an accident at the Brussels Museum. Seven pictures by the great Flemish master had been placed in a room which has just been built, pending their removal to the gallery where they are to be exhibited. A short time

since, a portion of the cornice broke off, and fell upon them. Five of them were protected by their massive frames, and sustained no damage; but the *Adoration of the Magi* was torn in several places, and in the *Martyrdom of Saint Lievin* the canvas was somewhat bruised. However, no essential part was touched in either case, and it is believed that both pictures can be restored so as to leave no traces visible at the distance at which the spectator stands from the top of the picture.

TWELVE of Wilhelm Kaulbach's pictures, in the possession of King Louis of Bavaria, have by his Majesty's permission been photographed for public sale, and may now be bought at Munich at Albert's print-shop. Some of these pictures have never before been copied, and are mostly illustrative of some scene or motive taken from the works of Schiller, which were alike favourites with the sovereign and the artist. A few illustrate the "Tannhäuser" and "Lohengrin," and thus help to supplement the previously published "Wagner Gallerie," with which they accord in size and style.

ARNOLD SCHULTEN, one of the earliest and at the same time most productive of the Düsseldorf school of landscape painting, died recently at Düsseldorf, at the age of sixty-five. He was known in earlier times as "Tree Schulten," to distinguish him from other artists of the same name, and as a tribute to the excellence of his manner of rendering foliage; but in later years his best pieces were those in which he painted the mountain and lake scenery of the Bavarian Alps and Switzerland.

THE Bavarian sculptor, Christian Roth, well known through his various admirable busts, and by the publication of an excellent series of anatomical plates, illustrative of plastic art, is engaged on a design for a group which is intended to embody the idea of the "Wacht am Rhein."

THE unpleasant and complicated relations to which the Schliemann case has given rise, have led the Turkish Government to issue a new ordinance in reference to the excavation and exportation of objects of antiquity from the dominions of the Sultan. This enactment, which is intended to supersede the earlier one of 1872, embraces thirty-six distinct articles, and considers antiquities under two heads, viz., (1) coins and medals, and (2) other moveable or immovable remains of antiquity. The right of possession in regard to such objects is vested in the State generally; but in cases where they have been procured by means of excavations, undertaken with official permission, one-third of the things themselves, or one-third of their accredited value, shall be made over to the proprietor of the soil, one-third to the fiscal officers, and the remaining third to the finder. The permission to undertake excavations can be granted only by the Minister of Instruction at Constantinople, after the written consent of the proprietor of the soil has been brought forward, and all necessary fees have been paid. Excavations undertaken without regard to these required conditions are punishable by imprisonment, or money-fines, according to circumstances; and all explorations are under the official supervision of the Ministry of Police at Constantinople, and the official authorities in the provinces.

The exportation of antiquities of all kinds requires the consent of the Minister of Instruction, and all such objects that have been despatched from a Turkish town or port without the required permit, may be seized, and are to be regarded as contraband, while explorations are strictly prohibited within religious buildings, schools, water-courses, public roads, and burying-places. These restrictions, together with numerous other vexatious prohibitions, would certainly seem to demand an exceptional amount of zeal, and no ordinary share of patience, on the part of all who are disposed to venture upon excavations in the future within the dominions of the Sultan.

DR. E. PAULUS, of Stuttgart, has published a report of his recent examination of a number of so-called Alemannic or Frankish graves, near Tuttlingen, in Würtemberg. The skeletons, which had been tolerably well preserved in the silicious deposits of the banks of the Danube, were in many cases found without remains of clothing or industrial objects of any kind. Near some, feminine ornaments were found, as bronze ear-rings with pendants, and necklaces, composed of coloured glass and clay beads. One grave, which was remarkable for being upwards of five feet below the superimposed deposits, while the majority were only about one and a half or two feet below the surface, contained the skeleton of a largely-developed aged man, having at his right hand a long two-edged iron sword, with a bronze inlaid wooden scabbard, a finely-cut iron spear-head, a small iron battle-axe, and a highly ornamented ivory comb. This skeleton, like the others, lay with the face turned towards the east, and seemed, by the number and the perfection of the weapons and other objects buried with him, to have been a person of distinction. The sword and axes, which differ from any hitherto found in Würtemberg graves, and the manner in which the bodies were laid in the ground, appear to show that they belong to the Frankish age (from the sixth to the eighth century). Some time ago numerous fragments of Roman amphorae and other vessels stamped with the letters C. POSV. RV. were found in the neighbourhood of these old graves, but while the latter were, as already mentioned, embedded in the uppermost stratum of the river deposits thrown up by repeated inundations of the stream, the Roman remains lay more than seven feet below these superimposed beds, which must thus have been accumulated with great rapidity during the period that had intervened between the Roman occupation of Germany and the times of the Alemannic or Frankish inhabitants of the Würtemberg territory.

THE municipality of St. Gallen have recently formed the praiseworthy resolution of restoring to Austria the interesting standards which formed part of the trophies won by the Swiss at the battles of Granson and Nancy in 1476 and 1477, over Charles the Bold, Duke of Burgundy. The most remarkable of these relics are three standards, terminating in long pennants, supposed from their form to have been carried by cavalry troops. Two of these bear the image of "St. Judas," with Charles's motto "Je lay emprints," and the insignia of the order of the Golden Fleece. They are painted in red on a silver field, with the letters in gold; while the third, instead of being dedicated to the same apocryphal saint, bears the image of St. Paul on an azure field, but is in other respects similar to the former in colours and design. The accurate drawing of the figures, and the taste and delicacy with which the accessories have been put in, warrant the assumption, hazarded by the local connoisseurs, that they are by the hand of Hans Memling, the Court painter of Charles the Bold, who was present at the battle of Nancy and was left wounded on the field. These standards are almost identical with the previously restored Swiss trophies which were recovered through the exertions of Herr Eigner, and are now in the Arsenal at Solothurn; but these, instead of bearing long pennants, are triangular in form, and are believed to have been the pennons carried by the Burgundian foot-soldiers.

THE STAGE.

"ZAÏRE."

THE theatrical event of the week in Paris—more than that, the theatrical event of the whole summer—has been the revival of the *Zaïre* of Voltaire: the piece which Voltaire wrote in part to show the benighted fellow-countrymen of Shake-

speare how a tragedy ought to be composed. It is almost twenty years since *Zaïre* was represented in the Rue Richelieu; and apart from the excellence of the acting of those who at present perform it, the piece itself—if not wholly successful in lightening our insular darkness—is at least among the more noteworthy of Voltaire's contributions to the theatre. It is, of course, in form, a classical tragedy, but its value is not in this, and to Voltaire himself its main interest after all consisted in the proof it gave that he, as well as any other, could make a hero who should be a lover too. It did prove that; for, with Othello's jealousy, Orosmane has something of Othello's ardent love; but it did not show by any means—despite its many poetical passages—that the philosopher could forget his philosophy and become wholly a poet. For Voltaire is only half dramatic in the following lines which *Zaïre* speaks of her Moor:—

"Dieu pourrait-il haïr un cœur si magnanime?
Généreux, bienfaisant, juste, plein de vertus.
S'il était né chrétien, que serait-il de plus?"

And he is not dramatic at all in these other lines, in which his heroine makes a tolerant self-analysis:—

"La coutume, la loi plia mes premiers ans
A la religion des heureux musulmans.
Je le vois trop; les soins qu'on prend de notre
enfance
Formont nos sentiments, nos mœurs, notre croyance.
J'eusse été, près du Gange, esclave des faux dieux,
Chrétienne dans Paris, musulmane en ces lieux.
L'instruction fait tout, et la main de nos pères
Grave en nos faibles cœurs ces premiers caractères,
Que l'exemple et le temps nous viennent retracer,
Et que peut-être en nous Dieu seul peut effacer."

Yet, notwithstanding these lapses into philosophy, the work is poetical by reason of the strength and variety of the emotions it portrays—the conflict, on the heroine's part, between two duties: love for her kinsmen and her kinsmen's faith, and love for her new lord—and the conflict on the hero's part between passionate love and passionate jealousy. Its motive is more elaborate and complicated than the motive of *Othello*—nay, the action itself shares in the elaboration and complexity of the conception. *Zaïre* is herself a force in the tragedy, while Desdemona is passive. Desdemona is more pathetic through her very passiveness and helplessness. A fate comes upon her which she can never avert. She saves her say, and it is a powerless one. But *Zaïre* plays a part in the piece, and does not merely suffer. She could herself change the event by a word—and the word is not spoken. That shows at once how Voltaire has carefully made complex what Shakespeare left simple, if it shows besides—and it does show—that the foundation of reasonableness upon which the tragedy is built is slight indeed. A more ambitious artist, and a work of wider scope, and less successful in the attainment of its end—that is another way of rapidly disposing, not so much of a comparison as of a superficial resemblance. There are more ways than one of tracing the resemblance: here and there in *Othello* there are details which seem the source of a direct inspiration. Compare, for instance, these lines, which we quote now from the last words of Orosmane, with the familiar lines quoted directly after. It is to Nerestan that Orosmane speaks:—

"Et toi,
Guerrier infortuné, mais moins encore que moi,
Quitte ces lieux sanglants: remporte en ta patrie
Cet objet que ma rage a privé de la vie.
Ton roi, tous tes chrétiens, apprenant mes malheurs,
N'en parleront jamais sans répandre des pleurs.
Mais si la vérité par toi se fait connaître
Dis-leur que j'ai donné la mort la plus affreuse
A la plus digne femme, à la plus vertueuse
Dont le ciel ait formé les innocents appas;
Dis-leur qu'à ses genoux j'avais mis mes Etats;
Dis-leur que dans son sein cette main s'est plongée;
Dis que je l'adorais et que je l'ai vengée. [Il se tue.]

And now read—only you know it—

"A word or two before you go.
I have done the State some service and they know't.
No more of that. I pray you in your letters,
When you shall these unlucky deeds relate,
Speak of me as I am; nothing extenuate,
Nor set down aught in malice: then must you speak
Of one that loved not wisely, but too well;
Of one not easily jealous, but, being wrought,
Perplexed in the extreme; of one whose hand,
Like the base Indian threw a pearl away
Richer than all his tribe; of one whose subdued eyes
Albeit unused to the melting mood,
Drop tears as fast as the Arabian trees
Their medicinal gum. Set you down this;
And say besides, that in Aleppo once,
Where a malignant and a turbaned Turk
Beat a Venetian and traduced the State,
I took by the throat the circumcised dog,
And smote him, thus. [Stabs himself.]"

Zaire has tested to the utmost the powers of those who are representing its two chief characters—its amorous and jealous hero and its martyr heroine—and M. Mounet-Sully has stood the test well, and Mlle. Sarah Bernhardt triumphantly. In other words, there has been praise and there has been reproach for M. Mounet-Sully, while for Mlle. Bernhardt there has been nothing but praise. Some critics have said of the young tragic actor that he rants through five acts, and is wholly a savage. Another has said that he is not a savage; that he is the Arab of Decamps, of Fromentin (rather too much of a mere studio Arab, of late, by the bye), or, better, that he is the Moor of a water-colour by Regnault. Well, for his savagery, for his rage in what may be seemingly its greatest excess, M. Mounet-Sully has some justification in the dialogue, for one of the *dramatis personae* says of Orosmane that he has "the loves of a Tartar," and that in the middle of his tenderness he is "a tiger still wild;" and Orosmane says of himself—

"Excuse les transports d'un cœur offensé;
Il est né violent; il aime; il est blessé.
Je connais mes fureurs."

At certain moments, then, M. Mounet-Sully made an impression which was not only striking but deserved. If one asks whether at all times his performance was restrained by good taste, one has to answer, No. But no sane critic has ever claimed for him that he has reached perfection. It is claimed for him, that, like Mr. Irving, here in London, he has dramatic genius which faults and mannerisms cannot wholly hide. Mlle. Sarah Bernhardt has not made her way without difficulty with the critics, but even those who are least favourably disposed towards her, allow that by the present performance she rises well nigh to the first rank of artists. As for Monsieur Sarcey, he tells you "you cannot imagine her inexpressible tenderness," and again, "quels admirables retours de dignité offensée!—quelle grâce et quelle noblesse d'attitude!" It is evident that she has composed a performance more striking, though not more delicate, than that which she gave us in the second rôle of *Le Sphinx*, and in M. André Theuriet's dramatic version of the pathetic Scotch ballad. But her art is not of the kind to become town-talk, even in such a centre as Paris. It satisfies, rather than dazzles, and is always too restrained to be sensational. The father of Zaire is represented by Maubant: the brother, by Pierre Berton. Better parts have aforesaid fallen to the lot of both; and for the time, both must be content to be eclipsed.

FREDERICK WEDMORE.

WE are in quite the dullest days of the theatrical year, and there is little to record. Only seven West End playhouses are open, and at most of these the performance is adapted specially for the provincial visitor.

A STRANGE sign, perhaps, in the political world as well as in the theatrical—that the East End

playgoers are *plus royalistes que le roi*. Mr. Wills's *Charles the First* has been a great success, but now *The Bells* has been substituted for it—*The Bells* with Mr. Irving, as Mathias, of course.

AT the Princess's *The Willow Copse* is about to be substituted for *Janet Pride*. It gives the public another of their last opportunities of seeing Mr. Benjamin Webster in one of his most famous parts.

Clancarty remains for a little time on the bills of the Olympic. Miss Cavendish has withdrawn from the performance, and Miss Carlotta Addison has taken her place.

MDME. PASCA, who is still attached to the French theatre at St. Petersburg, is now *en villégiature* at Cabourg, Normandy.

THE revival of *Héloïse Parquet* has taken place at the Gymnase, the chief part being played by Mlle. Fromentin, as we announced it would be. They are not very famous days for the Gymnase, when Mlle. Fromentin is its principal actress.

SCHEY, the grotesque actor, who was so much admired in London, is engaged at the Théâtre des Variétés.

THE Paris Vaudeville will probably be reopened before the usual date. This is in consequence of the deplorable commercial failure which fell to the lot of the accomplished comedians when they made their recent experiment at the Queen's Theatre in London.

MESSIEURS MEILHAC and Halévy are arranging for the production of their piece, *La Veure*, at the Gymnase. It will be played probably when Mlle. Blanche Pierson returns to the theatre.

It is noted, concerning the revival of Voltaire's *Zaire*, at the Théâtre Français, that the furniture and stage appointments, though correct, are not of such marked beauty and costliness as to strike the eye very specially, to the detriment of the impression produced by the acting. A step in the right direction, this. In *Jean de Thommeray*, M. Perrin, the manager, was less moderate in his efforts for scenic effect.

WE have received from the Paris publisher, Trese (in the Palais Royal), a little book entitled *Desclée: Biographie et Souvenirs*. It is ornamented with a pleasant picture of what the celebrated actress must have looked like ten years ago, and unlike many brief biographies published soon after a distinguished person's death, to supply a demand and gratify a natural curiosity, it is not entirely worthless as a story of Desclée's life, nor entirely devoid of suggestiveness as to Desclée's character. Still, in the main, it only tells what was known before by all who had any opportunity of being well-informed. It puts down in black and white what the well-informed had whispered to each other: the brief analytical article which appeared in our columns directly she died, turns out to have been only too correct in its surmises and conclusions. "It seemed a singularly restless and unhappy art—that art of Desclée," wrote our dramatic critic, in these pages, the week the great actress died; "one associates with it little of tenderness, little of sweetness, nothing of repose, nothing of contentment. There was stillness enough, but it was felt to be the pause which precedes passion. And the feelings to which the artist gave most forcible expression were feelings now of bitter remorse, now of unavailing but subdued regret, now of breathless anxiety, now of strong contempt, and now of cynical indifference. She had not lived much in Paris until the last years of her life; but one felt that the women she represented knew all the worst side of the life of a capital, and that their pity for human weakness was not so much pity as supreme contempt." And this little book, which, though it is the work of a warm admirer and eulogist, has nothing over-gushing and hysterical, gives us the *mot de l'énigme*

—"the secret of the Sphinx." Desclée's life was poisoned almost at its source. She had known the extreme pressure of poverty, and something more, before ever she became capable of rising in her art. When she rose in her art, it was much too late for her happiness—the feverish success of the last few years could not give her back what she had lost. The book gives us many little facts, but does not give us the correspondence of Desclée, much of which would have a real literary as well as personal value. M. Dumas, it may be remembered, promised this, but has since, and no doubt wisely, seen fit to withdraw it. It might be too compromising to some who are now living. The book, then, brings together some personal reminiscences, some details of early life, and the long critical opinions expressed by the leading journalists of France whenever Desclée, of late years, essayed a new part. Her most distinguished successes in the French capital were four in number. First, in *Frou-frou*, then in *Une Visite de Noces*, then in *La Princesse Georges*, then in *La Femme de Claude*. She appeared besides in *Diane de Lys* and in M. Léon Laya's *Gueule de Loup*. The performance of the heroine of *Une Visite de Noces* was entirely unique. No acting but the most delicate and at the same time the most powerful could make the piece endurable: nothing less than genius, and nothing else than a very peculiar genius, could reconcile us to its revolting cynicism. The piece took hardly one hour to act, and contained no moment of high passion; but the strain was upon Desclée from beginning to end, and she never quitted the stage without going straight to throw herself, exhausted, upon the sofa in her dressing-room. It was partly the exhaustion which this acting occasioned her, that made her first dread the continued appearance before an exacting Parisian public, and then talk of throwing up her profession altogether, to seek the quiet of a convent. She met with a good deal of ill-will among some comrades at the Gymnase, when she succeeded; as she had done also, years before, when she had failed. She was very indulgent to them, and it was at peace with all the world that she died one morning of last March, in her third-floor apartment on the Boulevard de Magenta, attended by a servant who had been faithful to her for a quarter of a century, by a doctor, a sister of charity, and one or two friends whose devotion (to their credit be it recorded) began only in her sickness, and not in her prosperity. The little book which suggests these remarks is not of great or permanent value, but it evidently is not written in any unworthy spirit; for while it is very laudatory, it is also frank almost to temerity.

MUSIC.

NEW CHORAL MUSIC.

- Odysseus; Scenen aus der Odyssee, für Chor, Solostimmen und Orchester.* Von Max Bruch. (Op. 41). Partitur. (Berlin: Simrock.)
Schicksalslied; für Chor und Orchester. Von Johannes Brahms (Op. 54). Partitur. (Berlin: Simrock.)
Schicksalslied (Song of Fate). Translated into English by Mrs. Natalia Macfarren. Composed by Johannes Brahms (Op. 54). Vocal Score. (London: Stanley Lucas, Weber & Co.)
Manfred. By Lord Byron. Music composed by Robert Schumann (Op. 115). Vocal Score. (London: Stanley Lucas, Weber & Co.)
Messe Solennelle. By Charles Gounod. New Edition. (London: Goddard & Co.)

Of the various works the titles of which are placed at the head of this article, the first is the largest and most important in

its form, while the second is beyond all question the most remarkable in its contents. Schumann's music to *Manfred* and M. Gounod's Mass are not new works, but the present editions of both contain features which render them worthy of a short notice.

Max Bruch, one of the principal living German composers, was born at Cologne in the year 1838. His published works, numbering above forty, are mostly vocal, some without, but more with orchestral accompaniment. Of his instrumental compositions the most important are two symphonies and a concerto for the violin, which last-named work was played some four years since by Herr Joachim at the Crystal Palace, and recently by Herr Straus at the Philharmonic concerts. He has written two operas—*Lorely* (the libretto of which is that on which Mendelssohn was engaged at the time of his death) and *Hermione*, on the subject of Shakespeare's *Winter's Tale*. His *Frithjof* music, for male voices and orchestra, is on the continent one of his best-known and most popular works; and the *Odysseus*, now before us, his most recent production, is at present making the tour of the various continental cities with great success.

The present work is in reality a large cantata, of sufficient length to occupy an entire concert. The libretto, written by Wilhelm Paul Graff, is excellently constructed, and affords the composer much scope for musical treatment. It is divided into ten scenes, entitled "Odysseus on Calypso's Island," "Odysseus in Hades," "Odysseus and the Sirens," "The Tempest at Sea," "Penelope's Mourning," "Nausicaa," "The Banquet with the Phaiakes," "Penelope weaving a Garment," "The Return," and "Feast in Ithaca." In addition to the German text, an English version, by Mrs. Natalia Macfarren, is given in the score, the work being thus rendered available for performance in this country, should any of our musical societies be enterprising enough to take it up.

As far as can be judged from a careful examination of the present cantata, Bruch's talent must be pronounced dramatic rather than lyrical. In those situations where a powerful musical characterisation is demanded, and where the wild or supernatural has to be depicted, the treatment is often very masterly; on the other hand, in such scenes as those of "Penelope's Mourning," "Penelope weaving a Garment," and the final "Feast in Ithaca," the music, though always appropriate, is deficient in melodic charm. Bruch cannot be considered a great melodist; like Schumann, he relies for his effects on his harmonic combinations and the "Stimmung" (to use the German word for which we have no exact equivalent) of the whole piece to produce an impression upon his hearers.

The orchestral prelude with which the work opens, founded on a theme taken from the finale, is more distinguished for beautifully finished orchestration than for the intrinsic value of its musical contents. Here it may be remarked that Bruch's scoring is throughout the work most interesting, well-balanced and tasteful and often picturesque. The first scene, "Odysseus on Calypso's Island," opens with a very charming chorus of Calypso's nymphs (for female voices),

"Here, oh Hermes," instrumented with great delicacy and grace, a noticeable point in the score being the happy employment of the arpeggios of the flute and clarinet in accompanying the voices. The semi-chorus is followed by a solo for Odysseus (baritone), "Flow ye tears," in which the hero expresses his longing for home. This movement, though of no striking novelty in the melody, is of great truth of expression. Hermes (tenor) appears and consoles Odysseus by the promise of his safe return to Ithaca, and the latter returns thanks in a broad and spirited song, which concludes the number. The second scene, "Odysseus in Hades," is one of the subjects in which Bruch excels. The opening chorus of the companions of Odysseus, describing the spirit-world, where the light of the sun never penetrates, where all is veiled in silence and night, is a remarkable piece of tone-painting. Odysseus invokes the infernal gods, and summons the shades of Tiresias and of his mother to counsel him as to the future. The shades come crowding round the blood of the sacrifice, and their weird chorus "Who calls the shadows?" is dramatically contrasted with the terrified accents of the comrades of Odysseus. At length the latter fly in dismay, fearing the apparition of the dreadful Gorgon. The whole of this scene, though necessarily of a wild rather than a pleasing character, is full of power. The following piece "Odysseus and the Sirens," is, on the whole, inferior. The opening chorus of sailors is good, but the song of the sirens is wanting in charm. A great melodist, such as Mozart or Schubert, alone could rightly conceive the seductive tone which irresistibly lured all hearers to their ruin, and Bruch, as has been already remarked, is not a great melodist. All the luxuriance of a rich yet delicate orchestration is lavished upon the scene, but the themes of the chorus are somewhat commonplace. "The Tempest at Sea," which follows, is another masterpiece of descriptive music. Space will not permit a detailed analysis of this, the most amply developed number of the entire work; but special credit should be given to the composer for having avoided all reminiscences. Many musical descriptions of a storm exist, such as those in the "Pastoral" and "Scotch" symphonies, and in the overtures to *Guillaume Tell* and *Dinorah*, not to mention the "Storm Chorus" in Haydn's *Seasons*. Bruch's tempest reminds us of none of these, though in its tone it bears, perhaps, most affinity to Beethoven's rendering. The tranquil close of this number, after the storm has subsided, is of great beauty, and the whole piece, which forms the finale of the first part, must be pronounced one of the best portions of the work.

"Penelope's Mourning," which opens Part II., is a soprano solo of no special interest. It has been already said that melody is not Bruch's forte; and here, though the expression is truthful, there is a suspicion of dryness about the music which renders it less effective than several of the other movements. In No. 6, "Nausicaa," Bruch is in his element again. Here the sports of the queen and her attendants are depicted in a really charming semi-chorus,

remarkable for the piquancy of a somewhat uncommon rhythm, and for the beauty of its instrumentation. A good solo for Odysseus leads to a short duet and semi-chorus, "Strangers and mendicants are, ye know," which is extremely pleasing. Of the succeeding number ("The Banquet with the Phaiakes") the most striking portion is the "Song of the Rhapsodes," a chorus for male voices in unison, in which the histories of Agamemnon and Odysseus are told. The scoring here is particularly felicitous. The quartet with chorus in the same number, "Nowhere abides such delight as in the homestead" must also be singled out for special praise. The eighth scene, "Penelope weaving a Garment," is another of the less successful, because more purely lyrical numbers; but the "Return," which follows, being more dramatic, is excellent. The finale, "Feast in Ithaca," is, we cannot but think, one of the weakest portions of the whole work. The chorus with which it opens, "Say, have ye heard yet the tidings of joy?" is somewhat commonplace, and leads to a duet between Penelope and Odysseus, "Hail, oh my husband!" which is singularly colourless and wanting in passion. Those who remember the great duet in the second act of *Fidelio* will know how the outpourings of conjugal affection can be musically rendered. In comparison with that duet the present music appears pale and vapid to a degree; nor, unfortunately, does the final chorus, "In flames ascending," redeem the close. It is not only too diffuse, but the subjects on which it is constructed are uninteresting. It is much to be regretted that so interesting and enjoyable a work as *Odysseus*, taken altogether, undoubtedly is, should be marked at its conclusion by such a falling off.

One point should be mentioned here before leaving the work; and that is, that the composer has most happily imparted to the whole a certain antique tone well befitting his subject. It is impossible to explain precisely how this is accomplished; it is equally impossible, we think, not to feel the impression. We rank *Odysseus*, on the whole, as among the best and most important of recent compositions; nor, after examining the score, are we at all surprised at the success which it has met with on the continent.

Of Brahms's *Schicksalslied* we had occasion to speak recently, when it was produced at the Crystal Palace. We expressed at that time a very decided opinion that it was one of the most remarkable inspirations of true genius. The programme of the concert presented an analysis of the work from the pen of one of the ablest German critics, Dr. Hanslick, of Vienna, which is so excellent, that our readers will not only excuse but thank us if, instead of attempting a description for ourselves, we reproduce Dr. Hanslick's words. He says:—

"Brahms's *Schicksalslied* for chorus and orchestra is a composition of deep intention and pregnant individuality. Hölderlin's poem, with all its beauty, would seem neither in matter nor in manner to lend itself happily to music; and it would perhaps hardly have attracted anyone less earnest and less devoted to the ideas of greatness and eternity than Herr Brahms. The first and second stanzas of the poem celebrate the blessed repose of the Olympian deities 'droben im Licht';

glänzende Götterlüfte rühren euch leicht,' and these stanzas are sung by the choir after a lengthened prelude for the orchestra—*adagio espressivo legato*—in a noble, broad, slow movement in the key of E flat.

"To this divine picture the third stanza presents us with a direct contrast, in the lamentable lot of mortals forced to wander and never find repose. This the composer has expressed in a sombre *allegro* in C minor, full of thrilling eloquence and truly ideal expression. How clearly and simply is the picture given of the grief-laden mortals blindly wandering from one sad hour to another, 'wie Wasser von Klippe zu Klippe geworfen;' how piercing the high holding-note on the word 'blindlings;' how touching the long decline of the voices, 'ins Ungewisse hinab!' In this desolate frame of mind the poet leaves his readers. Not so the composer. With a turn of extreme poetry and beauty, which exemplifies in a remarkable manner the extraordinary transfiguring power of music, he carries on his strain beyond the last forlorn accents of the chorus, and passing in a few bars from minor to major, returns to the slow and solemn measure and the expressive strains with which he opened the work; and in a long orchestral finale raises poor humanity from its desolate condition to peace and joy. And this aim he pursues with the orchestra alone, in a style at once touching and perfectly intelligible—though more easily felt than described—through the whole of the concluding movement. The *Schicksalslied* strikes us, both in style and intention, as an echo of the *Deutsches Requiem* of the same composer; the idea which was there presented in a Christian being here given in a classical form."

It would be an impertinence to add anything to this admirable criticism; it is only needful to say that the pianoforte arrangement of the vocal score is excellently done, and that those of our readers (the majority probably) who would find themselves in difficulties over the full score will be able from Messrs. Lucas, Weber & Co.'s edition, to obtain a fair, though of course not complete, idea of this very remarkable composition.

Schumann's music to *Manfred* is, with the exception of the overture, all but wholly unknown in this country. It contains, nevertheless, some of its composer's most characteristic writing. Some of the incidental music—such as the "Appearance of a beautiful Female Figure" (No. 2), the "Entr'acte" (No. 5), and the "Adjuration of the Witch of the Alps" (No. 6)—is of rare beauty, and distinguished by that peculiar romantic tinge which gives such a charm to Schumann when at his best. Previous editions of the work have, we believe, only contained a German translation of Byron's poem; in the present copy, however, the original text has been adapted to the music, with such slight modifications as were rendered necessary from its having been originally composed to German words which occasionally varied in metre from the English. The pianoforte arrangement is very able. It has been of course impossible to bring the whole effect of the score within the reach of two hands; but very little of importance is omitted, while all needless difficulties have been most skilfully avoided. The work is beautifully printed, and, being published at a most moderate price, deserves to meet with a large sale.

M. Gounod's *Messe Solennelle* is not a new work. Commonly known as the "Cecilian Mass," it has been frequently

performed in the country, and has been also adapted to the words of the English Communion Service, and in this form sung in several of our churches. The present edition is announced on the title as "the only one authorised by the composer." It contains a new "Offertory" and an organ accompaniment, both written by M. Gounod, as he informs us, to secure his right in the work. The new Offertory was played when the Mass was given at the first of M. Gounod's concerts this season. It is a charming piece of music, decidedly superior to that which it replaces. The organ accompaniment is a curiosity. Some of it, as, for instance, that to the "Laudamus te," cannot be played on nine organs out of ten, because it repeatedly exceeds the compass of their keyboard. Other passages, such as the "Prière de la Nation" (p. 79), are obviously intended for the piano, and if played on the organ at all would simply sound ridiculous. We give M. Gounod credit for too much good sense, to say nothing of his great musical knowledge, to imagine that he would play some parts of this accompaniment on the organ as they are printed. We can only suppose that, either inadvertently or from want of time, part of the original pianoforte arrangement was left untouched, while the rest was remodelled. In any case, the organ part, as here printed, is "neither flesh, fowl, nor good red-herring"! EBENEZER PROUT.

THE full programme of the Gloucester Musical Festival, which will take place on September 8, 9, 10, and 11, is now issued. The list of the principal vocalists includes the names of Mdlle. Titiens, Miss Edith Wynne, Mdlle. Trebelli-Bettini, Miss Griffiths, Miss Antoinette Sterling; Messrs. E. Lloyd, Bentham, and Lewis Thomas; and Signor Agnesi. The solo instrumentalists will be Messrs. Sainton and Carrodus, and Miss Agnes Zimmermann. The chief works announced for performance are Spohr's *Last Judgment*, Weber's sacred cantata, "The Praise of Jehovah," a selection from the *Creation*, Rossini's *Stabat Mater*, *Elijah*, the *Hymn of Praise*, Rossini's "Messe Solennelle," and the *Messiah*; besides two miscellaneous concerts, at which, among other things, will be given the *Midsummer Night's Dream* music, and selections from *Don Giovanni* and *Oberon*.

THE Liverpool Musical Festival will commence on September 29, and be continued daily till October 3. It will include performances of Mendelssohn's *St. Paul*, Sullivan's *Light of the World*, Gounod's new mass, "Angeli Custodes," and selections from the *Creation*, *Messiah*, and *Israel in Egypt*, and miscellaneous concerts, at one of which will be produced a new orchestral work by Mr. J. F. Barnett, composed expressly for the festival.

THE twenty-fifth anniversary of the founding of the "Arion" Choral Society, at Leipzig, took place at the beginning of the present month, when a festival was held extending over four days.

A GRAND German musical festival was held last month at Cleveland, North America, in which 1,500 singers took part. Mdlle. Pauline Lucca was the soloist.

M. AMBROISE THOMAS has completed a new four-act opera entitled *Les Liqueurs*.

The *Musikalisches Wochenblatt* announces, on what it considers reliable authority, that Herr Schradieck, of Hamburg, is to succeed the late Ferdinand David as Concertmeister at the Leipzig Conservatorium.

POSTSCRIPT.

WE learn from *Nature* that there is some hope that an Arctic expedition of discovery may be despatched in the spring of 1875. The Prime Minister has undertaken to consider the subject carefully in all its bearings, and on the 1st of this month the presidents of the Royal Society and of the Royal Geographical Society, accompanied by a gallant admiral of long Arctic experience, had a preliminary interview with Mr. Disraeli.

MR. CAMPBELL CLARKE'S English version of *Le Sphinx* was produced at the Theatre Royal, Edinburgh, on Wednesday night. Mdlle. Beatrice played the heroine with great power and freedom from morbid effect; while Miss Moody ably seconded her as Bertha de Savigny, though showing a tendency to exaggeration at crucial points. The performance was very warmly received by a large audience.

THE suffering from famine in Cesarea, the White Mountains and Angora has been intense. Many thousands of the miserable inhabitants have already perished, and many more it was feared would fall victims to privation and disease. The authorities were exerting themselves energetically to grapple with the evil, and in Angora at least it was hoped that the worst was over, and that, thanks to the large arrivals of cereals, the Government would be able to supply the people with bread till the harvest was reaped. The English and American residents of Constantinople had intrusted considerable funds to the care of Mr. W. A. Farnsworth for the relief of the sufferers, and he had traversed the whole of the region affected in order to dispense the charity in the most effectual way possible.

THE *Journal du Havre* states that the great heat has occasioned an extraordinary breaking up of the ice-fields in the Northern seas, and enormous masses of floating ice are to be met with in the Atlantic, to the great danger of those vessels whose path they cross. A captain arriving at Havre, from Cape Breton, reports that one of these masses of detached ice passed him, four miles long and two broad, with an average of 400 feet above the level of the sea.

LITERATURE.

The History of France from the Earliest Times to the Year 1789. Related for the rising generation by M. Guizot. Translated by Robert Black, M.A. Vols. I.-III. (London: Sampson Low & Co., 1872-74.)

It is to be hoped that the title which the translator has given to M. Guizot's book may not deter any of the risen generation from reading what is, in some respects, the best history of France as yet written. M. Guizot's special strength lies in the art of historical portraiture. Each king or warrior as he passes across the scene leaves a distinct impression upon the reader, arising not from the repetition of some striking epigrammatic sentence or epithet after the fashion of Mr. Carlyle, but from the careful selection of such facts and anecdotes as are likely to bring into clear relief the personality of the actor. Nor does M. Guizot forget that even the best series of biographies does not make a history, and he is accordingly anxious to dwell upon those changes of institutions which, in the life of a nation, correspond with the changes of circumstances in the life of a man.

Where everything is so excellent it may seem presumptuous in a foreigner to ask whether M. Guizot has not sometimes been led to violate the rules of historical perspective by dwelling too much on the bright side of two phenomena of which he distinctly approves, the growing preponderance of the Tiers Etat, and the rise of the States General. Such a passage, however, as the following surely requires modification (ii. 42):—

"The more closely the French third estate is examined, the more it is recognised as a new fact in the world's history appertaining exclusively to the civilisation of modern Christian Europe.

"Not only is the fact new, but it has for France an entirely special interest, since, to employ an expression much abused in the present day, it is a fact eminently French, essentially national. Nowhere has burgherdom had so wide and so productive a career as that which fell to its lot in France. There have been communes in the whole of Europe, in Italy, Spain, Germany, and England, as well as in France. Not only have there been communes everywhere, but the communes of France are not those which, as communes, under that name and in the middle ages, have played the chiefest part and taken the highest place in history. The Italian communes were the parents of glorious republics. The German communes became free and sovereign towns, which had their own special history and exercised a great deal of influence upon the general history of Germany. The communes of England made alliance with a portion of the feudal aristocracy, formed with it the preponderating house of the British government, and thus played, full early, a mighty part in the history of their country. Far were the French communes, under that name and in their day of special activity, from rising to such political importance and to such historical rank. And yet it is in France

that the people of the communes, the burgherdom, reached the most complete and the most powerful development, and ended by acquiring the most decided preponderance in the general social structure. There have been communes, we say, throughout Europe, but there has not really been a victorious third estate anywhere, save in France. The Revolution of 1789, the greatest ever seen, was the culminating point arrived at by the third estate; and France is the only country in which a man of large mind could in a burst of burgher's pride, exclaim, 'What is the third estate? Everything!'"

Even if the third estate of the Abbé Sieyès had not been something far larger than the bourgeoisie of which M. Guizot is speaking, such a paean seems to be singularly out of place. The half, according to the Greek proverb, is more than the whole, and one would have thought that the English citizen who shared with members of other classes in controlling the government of his country, was better off than the French citizen who had gained the foremost rank as the humble servant of an almost absolute monarch. No doubt M. Guizot points out that the bourgeois took their places in the States General, and that the States General tried their best to consult for the common interests of the nation. But even in his pages it comes clearly out that these States General were very poor affairs, though M. Guizot is, perhaps naturally, too much occupied with tracing the germs of free institutions which they contained to dwell as fully as he might have done upon the reasons of their failure.

The history of mediæval France, as it stands before us in M. Guizot's pages, is the history of division, of local divisions superseded by class divisions. We may hold that the change was a benefit, that the rule of the King and the Tiers Etat was better than the rule of the feudal aristocracy and the communes. But it ought clearly to be perceived that anything like a parliamentary government was impossible under such conditions. It is easy to say that Philip IV. (ii. 48),

"by giving admission amongst the States General to the burghers of the good towns, substituted the Third Estate for the communes, and the united action of the three great classes of Frenchmen for their local struggles;"

but bringing together the representatives of classes could not weld them into the representatives of a nation, unless there was first a united nation to represent.

The evils of the local divisions are clearly shown by M. Guizot. He points out that the antipathy against the feudal system is not merely the fruit of the great Revolution (i. 285):—

"Go back," he says, "to any portion of French history, and stop where you will: and you will everywhere find the feudal system considered by the mass of the population a foe to be fought, and fought down at any price."

It is not in the misery caused by the system that M. Guizot finds the explanation of this. There have been despotisms as bad, he says, and miseries even worse. The real cause was, that in a centralised state the despotism, however bad, was a long way off. To the French peasant of the Middle Ages (i. 286),

"their sovereign was at their very doors, and

none of them was hidden from him, or beyond reach of his mighty arm. Of all tyrannies the worst is that which can thus keep account of its subjects, and which sees, from its seat, the limits of its empire."

And this localisation of power which was the ruin of feudalism proved the ruin, too, of that movement which at first promised better things, the movement which produced the communes. True to his principle of teaching by example, M. Guizot gives us the history of the commune of Laon. It bought its freedom from "the clergy and the knights" who ruled in the name of the absent bishop, and its citizens bade defiance to king and bishop when they tried to strip them of their rights. After murdering the bishop, they obtained recognition of their independence. But their existence was a turbulent one, and turbulence brought about its usual consequence of weakness. The commune was abolished, and the town was given over to the government of the delegates of the King.

The government of the delegates of the King was the form in which the rule of the Tiers Etat took shape. As the kingship sprang out of the feudal ranks, so the Tiers Etat sprang out of the ranks of the communes. The two together represented unity after a fashion. But they could only represent it in a combative way. The centrifugal tendencies were still so great, that in the struggle against disruption there was no room for the development of political liberties, no room for the foundation of a national government upon the union of classes. The unifying efforts of the kings were always carrying them nearer to centralised despotism. The unifying efforts of the Tiers Etat were always carrying them nearer to the government of a single class.

This is the reason why the history of the States General is hardly more than a subject for antiquarian investigation. The States General of the Middle Ages answer to the wants of a future day, not to the wants of the days in which they meet. If they are active at all, it is when the king is in captivity, or when the king is a minor.

For the struggle against local disruption is not merely to be settled by the predominance of the king, or the predominance of the Tiers Etat in his name. The enemy has a footing within the camp. The king, sprung from the bosom of feudality, surrounded by feudal associations, is evermore falling back into the ranks of those from whom he came. The Tiers Etat, sprung from the communes, is evermore harking back to its starting point, fostering the jealousies of one province against the other, and forgetting its great work.

In the first two volumes the progress of the kingship is the main object before our eyes. We see it in the hands of men of saintly virtue like Louis IX., or of men of worldly wisdom like Philip IV., ever rising in power when it sets itself against feudality and division. We see it in the hands of Philip VI. and John striking sail to the hostile principle, and sinking down to a mere leadership of a warlike aristocracy, without pity for the people or thought for the prosperity of the realm.

The government of Charles V. may be taken as typical of all that was best in the old French monarchy. It (ii. 195)

"was the personal government of an intelligent, prudent, and honourable King, anxious for the interests of the State at home and abroad, as well as for his own, with little inclination for and little confidence in the free co-operation of the country in its own affairs, but with wit enough to cheerfully call upon it when there was any pressing necessity."

One day, M. Guizot tells us (ii. 194),

"the treasurer of Nîmes had died, and the King appointed his successor. His brother, the Duke of Anjou, came and asked for the place on behalf of one of his own intimates, saying that he to whom the King had granted it was a man of straw and without credit. Charles caused inquiries to be made, and then said to the Duke: 'Truly, fair brother, he for whom you have spoken to me is a rich man, but one of little sense and bad behaviour.' 'Assuredly,' said the Duke of Anjou, 'he to whom you have given the office is a man of straw and incompetent to fill it.' 'Why, prithee?' asked the King. 'Because he is a poor man, the son of small labouring folks, who are still tillers of the ground in our country.' 'Ah!' said Charles, 'is there nothing more?' 'Assuredly, fair brother, we should prize more highly the poor man of wisdom than the profligate ass;' and he maintained in the office him whom he had put there."

It was the *carrière ouverte aux talents* anticipated. The members of the Tiers Etat were to take the place of the profligate asses. They rose in defiance of feudalism, they did not amalgamate with it.

Again and again, as we read these pages, our thoughts are carried away to the France of our own day. The great Revolution put a final end to the local divisions, but the class divisions which succeeded them are still rampant. To obliterate these, to cherish a national spirit which shall turn aside from unprovoked attacks upon neighbour States to the cultivation of wise sympathy with the wants and aspirations of noble and burgher, peasant and workman alike, is the first requisite for the foundation of moral order. *Ce qui divise le moins* might have been the watchword of the old monarchy in its best days. It will be the watchword of any form of government which may at last permanently succeed it.

M. Guizot's second volume ends with the reign of Louis XII., in whom the divergence between the origin and the aim of the kingship is marked by the strongest lines of demarcation. At home he is the father of his people, taking off taxes and administering justice. Abroad he is the leader of chivalry, squandering the blood and money of France in useless adventures. We are thus brought down to the threshold of modern times. M. Guizot's third volume, deals with the appearance of one more cause of strife. Protestantism, as he shows, never had a chance of becoming a national religion. Francis I. was not the man to take it up. He had just bargained away the independence of the French Church in the wretched Concordat, by which he made over the souls of Frenchmen to the Pope, on condition that the patronage of benefices should be his. But the cause of the evil lay deeper than this. Protestantism, loosing old ties as it did, and throwing men adrift in the isolation of personal faith, was nowhere in the six-

teenth century permanently accepted by any people which had not a firm grasp upon the idea of the commonwealth as a foundation of law and order. In France the state was little more than a term for a truce between opposing factions. And if men could not idealise the state, there was nothing left for them but to idealise the Church. The average Frenchman had nothing before him which could take its place as a disciplinary institution.

The old, sad story of the religious wars loses none of its interest in M. Guizot's hands, though it may be remarked in passing that it is a pity that he has allowed himself (iii. 376) to resuscitate the fiction of an agreement between Catharine de Medici and Alva for common action against the Huguenots. It is with a sigh of relief that we reach at last the days of Henry IV., the great pacificator, whose work was to unite divided France, and who took his stand above classes and factions to teach France that she was really one. As we read these pages we feel how unity was the hidden treasure in quest of which France had gone forth, we understand how it was that the young Republic of 1792 was impelled to style itself "one and indivisible," and how, after all the struggles and sufferings of the past, she is still upon the track, careless of political liberty, careless of many things which other nations prize, till class can meet class and opinion meet opinion on the broad grounds of nationality.

In this way we are brought round at the end of M. Guizot's three volumes to the point at which we started. When he tells us (iii. 1) that "France, in respect of her national unity, is the most ancient amongst the states of Christian Europe," he says that which, except in a superficial sense, is simply misleading. In any sense worth talking of, England achieved national unity when France was still, according to Sismondi's well-chosen phrase, *confédérée sous le régime féodal*. England's two great flights in the direction of political liberty—the flight which commenced with the Great Charter, and the flight which commenced with the Petition of Right—were each taken after periods in which the unifying spirit was predominant. The key to French history in the past, as well as to the French history which is being unrolled before our eyes, should surely be sought for in its defective unity. The sense of this want betrays itself alike in the desperate efforts of France to supply the defect by an external centralisation, and in the failure to found orderly liberty amidst the strife of parties.

SAMUEL R. GARDINER.

An Echo of the Olden Time from the North of Scotland. By Rev. Walter Gregor, M.A., author of "Glossary of Banffshire Dialect." (Edinburgh: Menzies & Co., 1874.)

INTO the compass of a very small volume Mr. Gregor has contrived to pack a great deal of interesting and valuable information about the North of Scotland, as it was in the olden time which preceded the last few years of rapid locomotion and general culture. A pleasanter and more instructive

companion through the field of folk-lore we have not for some time encountered. Beginning with a picture of the farm-house as it used to be, he gives a graphic sketch of an evening in the farm kitchen, describes the dame's school and the parish school, traces the young students from those educational establishments to college, and follows into the manse those among them who take to theology as a profession. An account of what a Scotch Sunday used to be comes next, and after that a series of pictures of domestic life, wherein is portrayed the progress of a Scotch peasant pilgrim from his cradle to his grave. In building the farm-house, it seems it was necessary to begin by regaling the workmen with a *funin pint*. This, which answered to the sacrifices offered to the gods in heathen times under similar circumstances, could not be omitted with impunity. In the case of a manse on the banks of the Spey, tradition tells that the minister rashly refused to give the usual *funin pint*, but the masons avenged themselves by building into the wall a piece of a gravestone. "The consequence was, the house proved unhealthy, and the ministers very short-lived." When removing from one domicile to another, it may be remarked it was accounted unlucky to obtain a clean house. If the out-going tenant was jealous of his successor he swept the house clean before leaving it; for "dirt's luck" was a proverbial saying. There were two other methods of robbing a house of its luck. One was to get on the roof and "pull up the crook through the *lum*, instead of removing it in the usual way by the door;" the other was to twist a straw rope from left to right, and then pull it round the house contrary to the course of the sun. Sometimes the outgoer not only carried off the luck of the house, but he left a curse on its future inmates. If that was suspected, it was thought prudent to fling a cat into the house before the family crossed the threshold. Where the suspicions were correct, "the cat in no long time sickened and died." Among the means employed to light the farm-kitchen in the winter evenings were "fir-can'les," thin bog-fir splinters, closely resembling the *luchina* still used for the same purpose in Russia. These were fixed in a sort of candlestick called the "peer-man" or "peer-page." By the light of these primitive candles and of the peat fire the family pursued their various avocations, the children conning their lessons and the grown-up people performing various tasks. Then the books would be laid aside, and with story and ballad the long evening would be whiled away. The stories were listened to with breathless interest, for they generally referred to supernatural influences about which little scepticism existed. The progress of education had not then destroyed the ancient superstitions of the land. While a woman was in labour all the locks in a house were undone. On the birth of a child the mother and offspring were "sained," a lighted fir-candle being carried three times round the bed, and a bible, together with a biscuit or bread and cheese, being placed under the pillow, while a kind of benediction was uttered. Among some of the fishing popula-

tion a fir-candle, or a basket with food in it, was placed on the bed to keep off fairies; sometimes a pair of trowsers was hung up at its foot with similar intent. The first time the mother went to fetch water, she carried it back in her thimble, or some other tiny vessel, "to prevent the child's mouth from continually running saliva." Other precautions also were deemed necessary in the case of a new-born babe. It was thought as well to pass it three times through its mother's petticoat or chemise, to guard against its being "forespoken." If it became cross and began to "dwine," fears arose that it might be a fairy changeling. In that case it was placed suddenly before or over a peat fire, when, if really a changeling, "it made its escape by the lum, throwing back words of scorn as it disappeared." It was never put into a quite new cradle. An old one was borrowed, or else a new one was deprived of evil influences by a live fowl being placed in it. A cradle, moreover, was never sent empty, nor was it allowed to touch the ground till it reached the house in which it was to be used. The child was baptised as soon as possible, for unchristened babes were considered uncanny. While in that state their names were never mentioned, and even "at baptism the name was commonly written on a slip of paper, which was handed to the minister." When the christening took place care was taken to prevent the water entering the child's eyes; otherwise they might be opened to a lifelong seeing of ghosts. If the child remained quiet it was likely to be short-lived, so "it is said that if it did not cry the woman who received it from the father handled it roughly or even pinched it." If a boy and girl were baptized together it was held necessary that the girl should undergo the rite first. For it was believed that "if the boy was baptized before the girl he left his beard in the water and the girl got it."

About courtship and marriage the usual superstitions were prevalent. A curious spell to be employed by a girl who desired to call up the image of her future husband was the following. She had

"to read the third verse of the seventeenth chapter of the Book of Job after supper, wash the supper dishes, and go to bed without the utterance of a single word, placing below her pillow the Bible, with a pin stuck through the verse she had read."

A bridal dress might on no account be tried on before the wedding-day, and if it did not fit, it could not be cut or altered, but had to be adjusted the best way possible. When the bride set out for the church she was strictly forbidden to look back, for "such an act entailed disaster of the worst kind during the married life." A good survival of old heathen practices may be recognised in the custom which prevailed of leading the young wife, on her return from the church, to the hearth, and giving her the tongs, "with which she made up the fire."

Death, of course, was supposed to be heralded by many omens. Three dull and heavy knocks, of eerie sound, might be heard "at regular intervals of one or two minutes' duration." Or the "dead-drap," a leaden and hollow sound as though of water falling slowly and regularly, might

presage a coming dissolution. Sometimes the light of a "dead-can'le" might be seen moving about the house in which the death was to take place, or a white dove "hovering over one that was soon to leave earth." The crowing of a cock before midnight was heard with alarm, and "the roost was immediately inspected to ascertain in what direction the bird was looking, and whether his comb, wattles, and feet were cold." If they were so, a death was near at hand. When anyone died the doors and windows were immediately thrown wide open; a piece of iron was stuck into the provisions in the house "to prevent death from entering them;" if there was a clock, it was stopped; if there was a looking-glass, it was covered. All the hens and cats were shut up, for if one of them passed over the corpse, the first person who saw the bird or beast afterwards would lose his sight. After the burial, in some places, bread and water were placed in the room in which the body had lain. "The dead was believed to return that night and partake of the bread and water."

Very few of the various superstitions which Mr. Gregor has chronicled are absolutely novel, but it is very interesting to possess authentic information of the existence, either now, or at least within the memory of man, of such wild beliefs among canny Banffshire peasants as are still firmly held by the benighted inhabitants of less instructed lands. That a Russian or Breton villager should cling to his ancient faith is not to be wondered at, but that the influence of heathenism should prevail so late among well educated Scotchmen is a striking proof of the tenacity of popular belief. In an interesting paper on "The Healing Art in the North of Scotland in the Olden Time," Mr. Gregor has collected a number of singular rites and spells prevalent in Banffshire. To all of them parallels may be found in other lands, but their long survival in Scotland is very strange. For even in the "olden time" of which Mr. Gregor treats, education was eagerly sought after there, and obtained even where the greatest difficulties beset its quest.

One of the most interesting portions of his book is that in which he describes the life of the village scholar. First, he shows us the old dame spinning beside her peat fire, and bestowing primary instruction upon the children seated on stools around the hearth. Then he describes the parish school, in which, "at a cost of less than twenty shillings a year, such an education was furnished as fitted the scholar for entering the University;" the said scholar having to prepare his lessons on his long walk to school, or during the brief intervals of repose by which his agricultural labours were alternated, or in the winter evenings by a feeble and flickering light. And lastly, he lets us see the young collegian, journeying on foot, or at best in a cart, towards far-off Aberdeen, there to live with a frugality to more southern Universities unknown; a few potatoes with a salt herring often serving for his dinner, so that "sixteen or twenty pounds, and at times a smaller sum, aided by what provisions came from home, covered all expenses."

As Mr. Gregor says, while speaking of

the "olden time," it was a narrow world to live in, "one which the great wave of the outside world seldom disturbed," but there was much in it that was good. And at all events it was actuated by "a sturdy spirit of independence, in wide contrast to the craven, beggarly spirit of the present day, that has no shame in asking, in the smallest pinch, help from the poor-rates," as well as by "a high sense of honesty and worth, and self-respect," and "a deep appreciation of female purity now too rare among the workers of both sexes." It is very possible to become somewhat less heathenish and very much more degraded.

W. R. S. RALSTON.

Persia: Ancient and Modern. By John Pigott, F.S.A., F.R.G.S., F.G.S. (London: Henry S. King & Co., 1874.)

THERE is no pretence to originality in this little volume. It is merely an attempt, and, we are bound to add, a creditable one, to compile from various authorities a readable account of a country always of great interest, and likely in the present state of political tension in Central Asia to be forced ere long into a very prominent position. The first three chapters contain a history of Persia from the earliest times to the Shah's visit to Europe, and the Reuter concession. The rest of the book is occupied by separate chapters devoted to religion, art, literature, commerce, sport, &c. We look in vain for some account of the physical and political geography of the land. The reader is nowhere told to what extent the people are homogeneous in origin and tongue, or whether Iran is a plain or mountain country. And yet no spot on earth has seen more constant and bitter conflict of races, or been more influenced in its history by the configuration of its surface. With the addition of a few pages on geography and ethnology, the book would be a fairly trustworthy handbook of Persia. Among many minor errors, we cannot help noticing the following. At the third page the author says, *à propos* of Cyrus the Younger:—

"Ten thousand Greeks accompanied his army, which force was defeated at the battle of Cunaxa, B.C. 401. The Greeks, it is hardly necessary to say, were commanded by Xenophon, and the gallant band accomplished their retreat from the field of battle of 3,465 miles in fifteen months."

Mr. Pigott omits Xenophon from his voluminous list of authorities, but the *Anabasis* is not a difficult work to obtain, and he may learn from it for his second edition that the Greeks were not defeated at Cunaxa, but remained masters of the field of battle, from which, therefore, they can hardly be said to have retreated; that they were commanded by five generals, the chief being Clearchus, who were treacherously slain by the Persians some time after the battle; and that Xenophon, though elected to replace one of the five, had previously held no rank in the army, and even after his election laid no claim to supreme command during the retreat from the Tigris to the sea, although he was, if we may believe his own account, the master spirit in the Greek camp. A little further on it is stated that Alexander visited the

tomb of Cyrus at Persepolis. That city was surely founded by Darius after the death of Cyrus, who was certainly buried at his own town of Pasargadae, where his tomb of white marble, exactly as described by the historian of Alexander's visit, still stands, hardly injured by the lapse of twenty-five centuries. Towards the end of the volume, in the chapter headed "Sport," is a curious perpetuation of one of the many blunders that disfigure a very entertaining work, Mounsey's *Journey in the Caucasus and Persia*, a blunder which was pointed out at the time the book appeared by a critic, if we remember rightly, in the *Saturday Review*. Mr. Pigott quotes Mr. Mounsey as authority for the identity of the "derraj" and the black-breasted sand grouse, two very different birds. The former is *Perdix francolinus*, the "kala titar" or black partridge of India, the francolin of Syria and Asia Minor, which haunts shady coverts and reedy swamps. The "bagri kara" of the Turks, the "siya siual" of the Persians, both meaning "black breast," is *Itieroches arenaarius*, a lover of sandy plains and stony wastes, and as dry and tasteless as the francolin is succulent for the table. Both are found in Persia, and are common in Mesopotamia, where the wide desert and the strip of marsh bordering the rivers affords a congenial habitat to both.

O. ST. JOHN.

The Rights and Duties of Neutrals. By William Edward Hall, M.A., Barrister-at-Law. (London: Longmans & Co., 1874.)

NEUTRALITY during war has become in modern times a fact of increased frequency and importance. First, the independence of the American colonies has called into existence a New World, often greatly agitated both in North and in South America, but in the convulsions of which the states of the Old World are seldom called to take part, while those of the New World remain equally strangers to the convulsions of the Old. Secondly, the break-up of the ancient European system of alliances has tended to prevent recent wars from becoming general. Thus two of the Great Powers remained neutral during the war of 1854, and the majority of the Great Powers remained neutral during each of the wars of 1859, 1864, 1866, and 1870. Thirdly, two of the instances referred to illustrate certain modern conditions of existence which tend in the same direction. France and Austria, in 1859, and Prussia, in 1866, availed themselves of their superior state of preparation, and of railways, steamers, and good roads, to commence wars and carry them through before there was time for effective interference, though Prussia in 1859 and France in 1866 were not indisposed to such interference. The second of the circumstances here enumerated may easily be altered by the reconstruction of alliances, and it may well be doubted how far either peace or international morality is promoted by the opportunity which the absence of a solid European system gives to aggression. In the meantime the circumstance exists, and as the first and third circumstances are of a permanent nature, we are justified in speaking of the large dimensions which

neutrality has attained as an international fact.

It may then fairly be said that the ascertainment by general consent of the rights and duties of neutrals is one of the most pressing needs in international law. It is not just or manly that those who avoid bearing part in the responsibilities of war should give unavowed aid to either side. Belligerents, it is true, do not desire impartial critics, but allies. Except where it is quite clear that the sympathies of a neutral, if declared at all, will be declared against them, they do not plead for strict neutrality, but, if they cannot obtain alliance, for what Count Bernstorff, during the Franco-German war, described to Lord Granville as benevolent neutrality. But breach of neutrality is a convenient reason to put forward, in justification of the bitterness which refusal of aid has really caused; and to remove all uncertainty as to the duties of neutrals is therefore not more important in the interest of just and manly conduct, than it is for the avoidance of complaints out of which further wars may arise.

The questions which from the close of the Middle Ages to very recent times were most disputed between neutrals and belligerents were those in which neutral individuals are concerned, but they have now given place in importance to questions affecting neutral states. Of the former class, that of the protection to be afforded by neutral ships to belligerent property on board of them has probably been finally decided by the Declaration of Paris of 1856, though there are still some in England who agitate against such protection. The question of defining contraband of war has of late slumbered, but that of the effectiveness of blockades was dealt with by the same Declaration in terms of extreme vagueness, to which England and France, with the general approval of the world, afterwards lent a practical interpretation in favour of laxity by respecting the blockade of the Confederate coast by the United States, which for a considerable time after its commencement was merely a loose paper blockade. It may be remarked in passing that this instance illustrates one of the main difficulties which oppose the ascertainment and improvement of international law, namely, the small value which every one seems to attach in practice to the maintenance of rules, as compared with the accomplishment of particular ends. As nations are vastly more self-sufficing than natural persons, the gain to be derived from the pursuit of individual ends, and the protection to be derived from the general maintenance of law, are of a very different relative importance in international affairs and in the affairs of citizens of the same state.

But the responsibility for the *Alabama* and her consorts which England could not succeed in escaping, and the demand of Germany during the late war that England should prohibit the export of arms, together with the intention since announced by Prince Bismarck of refusing to adhere to the three rules of the Treaty of Washington unless a declaration of the duty of prohibiting the export of arms should be coupled with them, sufficiently show the consequence which has recently attached to the rules which affect

the conduct of neutral states as such. This country, which, as well as Holland in the days of its maritime greatness, has been a leading supporter of the high belligerent view on the questions affecting individuals, takes the neutral view on the newer class of questions; and if our words should reach any of the so-called foreign affairs committees, which in some English towns keep up an agitation against the Declaration of Paris, so far as concerns enemy's goods in neutral bottoms, while stoutly defending the export of arms in time of war, we would recommend them to consider well how far their position is consistent with itself.

In a non-political journal it would be out of place to discuss any of the questions referred to. The chiefs of a few Bedouin tribes, meeting at rare intervals in the desert, or at one of the cities bordering it, might contrive to live in peace by merely observing towards one another those principles of *neminem laedere, suum cuique tribuere*, which are enforced by courts of law. But when the contact between men is close, the necessity arises for a dispositive justice, the justice of the legislator, which from time to time makes that an injury which was not previously an injury, and that a man's *suum* which was not previously his *suum*. Irish Land Acts are extreme cases, but probably no session of Parliament passes without some legislation of this kind. Now the contact between nations has always been close enough to require dispositive justice: such rules of international law as exist are to a large extent legislation by express or tacit convention; and any discussion as to their improvement or extension is for the most part necessarily of a political kind, to be carried on with a large view to the general good, and not to be confined to deductive reasoning from the legal notions of property or obligation, from the so-called ideas of the equality and independence of states, or from any other simple premises.

Mr. Hall says of the book which we have named at the head of this article:—

"The design of the present work is to ascertain, apart from all prepossessions in favour of English or of Continental views, what the relative authority of conflicting usages in fact is, and to separate distinctly those which have become obligatory from those which are still in course of growth."—(P. 3.)

Attending mainly to history, treaties, and state papers, and placing only in the second line the opinions of authors, and even his own views as to what international rules should be, the author has acted faithfully on the design thus announced, and in two hundred pages has given an amount of information which will be very useful to those who take an interest in these important questions, without having access to the larger compilations on international law: even with some of those larger compilations his book will compare favourably in the number of references to treaties. Mr. Hall has also the merit of being clear and accurate in the use of language. At pp. 63, 64, he contrasts "the issue from neutral waters of a vessel provided with a belligerent commission, or belonging to a belligerent and able to inflict damage on his enemy," which is generally allowed to be a breach of neutrality, with

the case, generally considered to be no such breach, of its neutral possessor selling an armed ship, and

"undertaking to deliver it to the belligerent either in the neutral port or in that of the purchaser, subject to the right of the other belligerent to seize it as contraband if he meets it on the high seas, or within his enemy's waters."

Compare this with the language of the three rules of the Washington Treaty: each contracting power will

"use due diligence to prevent the fitting out, arming, or equipping, within its jurisdiction, of any vessel which it has reasonable ground to believe is intended to cruise or to carry on war against a power with which it is at peace."

What diligence is due? By whom is the vessel to be intended to cruise, &c.? By her owner, by those who have the control over her, or by some government or persons who hope to acquire the property in her, or the control over her? And when the person who intends is ascertained, what is it that the rule describes him as intending to do? To employ the vessel in cruising, &c., or to sell her to some persons or government who will so employ her? In short, was the mere trade in armed ships, so clearly defined by Mr. Hall in the second of the sentences just quoted from him, intended by the contracting Powers to be struck at or not?

JOHN WESTLAKE.

Tiberius Leben, Regierung, Charakter. Von Adolf Stahr. (Berlin: J. Guttentag.) (Second Notice.)

AUGUSTUS had frankly accepted his position as the earthly providence of the Roman world; he had not attempted or desired to divide his responsibility with any constituted authority; Agrippa and his sons and Tiberius had held whatever power they exercised as members of the reigning "dynasty;"* the only business of the senate was to give more solemnity to his legislative and judicial decisions. His theory was to conciliate the aristocracy as a caste rather than as a corporation; he was glad that his improved administration multiplied employments which attracted them; he was anxious to protect and encourage individuals; his privy council gave the ablest and most energetic a personal position as high as they could have occupied or maintained under the old constitution. Tiberius might, if he pleased, have simply stepped into Augustus's position and continued Augustus's policy, but he thought both the risk and the responsibility of the position too great. He fancied there was a general wish to displace him in favour of Germanicus or some popular senator, or even the senate; he had a theory that it would be better to divide the administration, make one man answerable for the army, another for the civil administration of Italy, a third for that of the provinces. The plan showed some thought, and would have avoided the danger of the old triumvirate; but it had the disadvantage of leaving the sovereignty nowhere. It was shipwrecked by Asinius Gallus, who asked which office Caesar meant to take himself;

and Caesar had to reply that it would not be fair to choose after dividing the things to be chosen. After a tedious and undignified scene Caesar realised, what was not very surprising, that the senate was quite prepared to accept the inevitable; while the senate had discovered that it was impossible to understand the new Caesar or to be at ease with him.

Perhaps this is the place to say something of the "simulatio" of Tiberius which Herr Stahr, rather unfairly to Tacitus, translates by "Heuchelei," or "hypocrisy." Assuming Tiberius to have been a creature with mean impulses and fine aptitudes,* it is intelligible that there should have been a constant discrepancy between his inclinations and his conduct. Now a clever self-conscious man often tries to utilise even the less creditable elements of his character, as a violent temper and the like. It is conceivable that Tiberius might talk of his inclinations or his theories when he pretty well knew that he should have to act upon his circumstances; or, again, adapt his talk to his aptitudes, and leave his conduct to be determined by his impulses. Such a course would not imply conscious insincerity, and yet would produce exactly the same effect as deliberate insincerity upon outsiders, who would be justified in a way in inferring, when the aptitudes broke down altogether, and the impulses determined the conduct, that the man was giving way to his own nature at last. And this view of the "simulatio" of Tiberius would fit in with the profound remark of Dion, that he knew his own character and could not bear to own it, and was angry when detected.

However this may be, it is certain that Tiberius and the nobility started with an incurable misconception of each other, leading on both sides to much exaggerated alarm. This was a serious evil, especially as Tiberius was naturally harsh to individuals who crossed him, though his anxiety and his cautious provision for contingencies naturally exercised themselves for others as well as for himself. There is no contradiction in this. The elder Mirabeau was quite sincere in resenting the wrongs of the human race, though he was very tyrannical in his own unsatisfactory family.

It is true, indeed, that during the greater part of Tiberius's reign his mechanical conscientiousness imposed a certain check upon his harsh temper; at least, in his dealings with the higher ranks. But his system of government did more to aggravate the evil than his conscience to mitigate it. Though he continued to exercise all the powers committed to Augustus, he did not give up the attempt to limit his own responsibility. He wished to be simply the highest officer of the Roman State, with defined duties and prerogatives, bound like other State officers by the acts of Augustus as an organic law; and he wished the senate to stand beside him as something like a co-ordinate authority, relieving him both of work and of power. In the sphere of legis-

* This assumption may perhaps be made easier by another, that his impulses represented the degenerate tendencies of his baffled father, while the aptitudes came from his successful mother, a heathen Madame de Maintenon.

lation and administration the project failed without doing much good or much harm. Tiberius earned a little hollow popularity by submitting to be outvoted: he had to curb the fussy zeal of some good patriots who could not see that sumptuary laws were becoming an anachronism; he grumbled a good deal that the senate could not divine the precise division of labour that suited him, and sometimes proposed a vote of thanks to his soldiers, and sometimes asked him to find a governor for one of their provinces, and the like. At last he drifted into the habit of sending his orders, which the Fathers understood much better, though, if consulted, they would have preferred to be saved the trouble of meeting to endorse them. But in the sphere of high police Tiberius's system did serious mischief. His plan was to throw the odium of severity on the senate, and have the credit of clemency himself; but even when he remembered to mitigate the sentence, or to direct an acquittal, he gained less than he habitually lost by insisting on having everything tried and sifted to the uttermost; e.g., ascertaining by torture that a statue of Augustus had been sold, and then ruling that it was not a crime to sell it; and it is possible that Tiberius's private vices would have been passed over as lightly by historians as those of Trajan, but for his morbid craving to convict the authors of exaggerated pasquinades upon them. If Roman society had been sound and Roman legislation rational, Tiberius would have discredited himself without doing much harm to the State; but Roman society was corrupt and ferocious, and Roman legislation was very severe in theory, because no respectable opinion took it for granted that when a penalty had been incurred it ought of course to be inflicted. The apologists of Tiberius are fond of complaining that Tacitus does not profess that the victims of the prosecutions he deplores were innocent; he only records, quite honestly, the general impression that the prosecutions were spiteful and unnecessary. The laws were not meant to be enforced against any but very presumptuous sinners, as Tiberius himself knew when he pleased: for instance, he appointed a commission of fifteen to determine how many of the prosecutions under the marriage laws, which had become alarmingly numerous, should be allowed to proceed. Perhaps the story of Suetonius that Cocceius Nerva, the great jurist, killed himself because Tiberius had proposed to put in force the Julian legislation about contracts, is even more significant as to the unfitness of Roman law to be applied. And it was not only in the senate that the wooden-headedness of Tiberius allowed inapplicable laws to be applied at random; though we naturally fancy so because Tacitus records the action of the senate and not that of other courts (and here, too, his reticence has served the advocates of Tiberius). We know that it was one of his first acts to inform the praetor, in answer to a question whether he was to take cognisance of charges of *majestas*, that he was to enforce the laws; which amounted to bringing the very sweeping law of treason out of the sphere of prerogative, within which Augustus had employed it in defence

* The word is to be taken rather in its Greek than in its English sense.

of social decency, into that of common law. A modern reader sees that most of the "victims" of Tiberius had something like a fair trial; that it was by no means always Tiberius who set the law in motion; that sometimes he even mitigated the penalty; that lastly, when the prosecution was in his interest, it was generally a case of real disaffection—and then finds it hard to see where Tiberius was to blame. In the first place it is to be observed that a government which has to punish disaffection is always bad, and that Tiberius certainly much overestimated the danger from disaffection: in the next place, though the partisans of Sejanus, Agrippina, Livia, Drusus, and the rest, were not exactly stimulated by Tiberius to carry on a war of prosecutions, yet even here he was responsible in this sense, that such things did not happen under good emperors. The fact is, not only did Tiberius treat laws meant to legalise occasional administrative acts as part of the regular legal routine, but his whole administration tended to keep down what was best in the aristocracy and bring out what was worst. In the first place, he was afraid of superiority and ambition; and here the affection, which he carried as far as any of the early emperors, of being only a simple citizen, told very mischievously. A king can allow his subjects to distinguish themselves, because his office puts him essentially above them; but this only began with Domitian. It is an anachronism to talk, as Herr Stahr does, of a man being loyal or disloyal to "his Caesar" under Tiberius. And though Tiberius was not a demagogue, and was more inclined to maintain than break down the hierarchy of privilege in the Roman world, he found himself more comfortable in promoting a deserving underling, up to his work and not above it, than in employing a grandee who might not impossibly conspire. Even his care for the provinces, which led him to see that frequent changes of administration did harm, hindered him from seeing that idleness was bad for the nobility; and in the latter years of his reign his indecision went so far that he left provinces without any governors at all, having found already that it answered as well for the province to keep the governor at home, and make him send his lieutenants. As the result of all, a great deal of energy was repressed, and a great deal ran to spite more or less ignoble; and the aristocracy prosecuted each other as fast as they were allowed, and, when prosecuted, killed themselves because they were not in charity with themselves and the world. It is remarkable that public opinion, at least the opinion of the people, held Sejanus answerable for all that happened; and it is probably true that, at any rate after his retirement to Capreae, Tiberius's wish to lessen his own responsibility worked as follows:—Sejanus, or one of his dependants, set a charge in motion. Tiberius did not care what the decision was; he was only anxious the investigation should be thorough. Meanwhile a party in the senate, more imperialist than the emperor, always reinforced any party that prosecuted, unless the emperor declared for an acquittal. Sejanus seems to have owed his position to his being a man who could transact business rapidly

and pleasantly, while Tiberius was harsh and dilatory; so that it was a relief to his temper and conscience to refer suitors to the praetorian prefect, who multiplied in this way the influence he had gained by the concentration of the praetorian guard. The extent of the proscription which followed his execution has been attributed to the extent and formidable character of the conspiracy he is supposed to have organised. There is no proof whatever that Sejanus intended anything against Tiberius, except perhaps—and this is guessing—in the way of self-defence. He had really made a party to secure the succession at the expense of the children of Germanicus, which Tiberius thought a proof of madness, and determined thereupon to make away with him. His party while in power had made enemies; and these enemies availed themselves of the name and the fears of the emperor, and of the ill-use their rivals had made of prosperity, to exact wholesale vengeance; while Tiberius still showed a surviving ineffectual sense of equity by an edict permitting the relatives of the deceased to wear mourning. The divorced wife of Sejanus (who had as much reason to be jealous as Livia, and less tact in tolerating the politic infidelity of her husband) stated, before killing herself, that her husband had poisoned Tiberius's son eight years before by the agency of two Greeks, who were tortured, with many others. The charge did not break down, and torture in that age sometimes failed to establish charges; but it is surprising that one historian after another has repeated it as certain, especially as Tiberius in his memoirs seems to have rested the execution of Sejanus exclusively on his schemes to oust the children of Agrippina. Whether he believed or no that his favourite had murdered his son, Tiberius had every reason to be miserable, and his misery made him grimmer than ever. His suspicious indecision became a positive disease; he was always ordering arrests and prosecutions with utter recklessness of human suffering. All the while he retained a perverted pedantic regard for justice; he seldom condemned till convinced, rightly or wrongly, that the condemnation was deserved; and, when a prisoner begged to be put out of pain at once, grimly replied he had not made friends with him yet, implying he had no right to ask a favour. Another consequence of this misery was that Tiberius plunged into systematic sensual excesses, of which he made freeborn girls and boys the victims, so that we have the same evidence in kind against him that we have against Louis XV. This was the consummation of the breakdown of his nature, which, like Swift, he had feared before it came. He had assigned the possibility of his ceasing to be of sound mind as a reason why the senate should not swear to his acts. His contemporaries thought that he foresaw his degeneracy in his horoscope. Herr Stahr imagines he was too sensible for such a superstition as astrology, and only kept Thrasyllus near him because he was a great scientific teacher. This, like the rejection of the sensual excesses, is arbitrary and *a priori*, and, besides, has not the merit of probability. Astrology has always been rather a chimerical science than a superstition

—a fantastic way, adapted to imperfect knowledge, of putting the view that human conduct and human fortune is irrevocably fixed by natural causes; that cosmic forces determine the character which is our fate. It is very natural that a slow, sceptical mind should be drawn to this form of fatalism and be the worse for it.

Herr Stahr has been more successful in apologising for the relations of Tiberius to the other members of the Imperial family. Till the order of succession is fixed, it is impossible to try the conduct of members of despotic dynasties towards one another by a standard high enough to condemn the execution of Agrippa Posthumus, ordered in Tiberius's name, probably without his knowledge, but still covered by his responsibility. Herr Stahr's patriotism leads him to under-rate the military superiority of Germanicus to Arminius. Velleius admired the achievements of the young hero, and it was probably a misfortune for Rome that Tiberius allowed himself, not without some pettiness, to adjourn the question whether it was desirable and possible to conquer the line of the Elbe, and to decide upon the narrow issue whether the results of three campaigns were worth their cost. Otherwise Tiberius seems to have tried to do his duty to his nephew, to have liked and even trusted him, though he was half afraid of him, and possibly showed a discreditable suspicion in the secret instructions given to Piso, whose wife seems really to have tried to bewitch Germanicus, though Piso was innocent of poisoning him. Still Tiberius was not sorry that Germanicus died. He was not insensible to affection, but his affections gave him more pain than pleasure; he could hardly regret their coming to an end, and he was too proud or too honest to observe the ceremonies of grief in deference to others. When Germanicus died, he published a fine edict about self-control. When he lost his mother, who had tyrannised over him, he cynically observed, he was too busy to put himself out of the way to be unhappy. In both cases the public were scandalised; they were angry, too, at the severity with which Agrippina and her sons were treated; and the severity was certainly indecorous, though Agrippina was provoking, and her friends disloyal and perhaps dangerous; and it was really inexcusable, even though the younger Drusus was crazy, to let him gnaw his mattress and die for want of food.

It is probable, however, that even this might have been condoned, if Tiberius's administration had favoured the healthy development of Roman life, and been adapted to the best Roman opinion. This is the real explanation of the evil reputation of one whom Herr Stahr has shown more fully than any of his predecessors to have been a great and well-intentioned ruler.

G. A. SIMCOX.

CHINESE MEDICINE.

Twelfth Annual Report of the Peking Hospital for 1873 in connection with the London Missionary Society. By John Dudgeon, M.D. (Shanghai, 1874.)

The study of medicine has in China always been regarded as of the highest importance.

Doctoring is a very favourite occupation of the literati of that country. A man needs no certificate to practise. He depends for reputation on the cures he performs, and his introduction to the profession is accomplished by his learning its duties from some physician who communicates to him his experience.

The two fundamental medical books are very old, and belong to the Confucian epoch or that of the Early Han. The doctrines of alchemy, which budded and blossomed in the Later Han age, or about A.D. 200, do not appear in these works. The combination of Taoist doctrine with the healing art by the alchemists of the Han dynasty and the time following it, marks a new period in the history of Chinese medicine. Before this time the forest hermit, gathering herbs in the mountains, became by successful cures a noted physician. Here was the first connexion between the Taoist religion and the history of Chinese healing. The notion of a vegetable elixir, that is, of the herb of immortality, dates from the time of the simple followers of *Lautsze*, or of the hermits who preceded him and whom he admired. The seekers of the elixir were in high favour with *T'sinshewang*, the book burner. Among the books exempted from destruction those treating on medicine were included. *Soo wen* and *Ling K'eu*, the two works above referred to, may have very well escaped from the memorable burning which raged most fiercely against the writings of Confucius and other political and moral writers.

The conquest of Cochin-China and of Central Asia by the early Han emperors led to the introduction of much outside knowledge into China, and acted powerfully to extend enquiry among the scholars of that country. But the new impulse imparted by the sight of new objects in nature and art did not herald any great improvement in real science. Astronomy became a more thoroughly elaborated astrology, and medicine became a pronounced alchemy, of which one feature was the distinct effort to discover the secret which would enable the happy alchemist to transmute common metals and other things into gold, and to guarantee immunity from death to every one who partook of the efficacious compound which issued from his laboratory.

The invention of alchemy was productive of more injury than benefit to medicine, and has not in China been succeeded as in Europe by a scientific age of enlightened enquiry. Alchemy of course fell into disuse because it failed. Two emperors are said to have died after partaking of the philosopher's stone. Repeated want of success tired out the operators and rendered popular faith in it impossible. Yet the names and hypotheses remained to cumber medical literature and obscure the intelligence of the physician.

At least a thousand years before the Christian era a doctrine of five elements existed among the wise men of China. It is found in the Book of History which dates from that time. This doctrine has beclouded the minds of the physicians of that country down to the present day. The five elements are in their view the five activities which operate on each other in the form of metals,

wood, water, fire, earth. Under the influence of this theory the ancient chemists while preparing medicines accounted in a ready-to-hand way for the phenomena they witnessed. Metals melting under the action of fire showed that the element fire conquers the element metal. But water extinguishes fire. The element water, therefore, which manifestly is the victor over fire, may be applied by those who know how to subdue all evils attendant on fire. In this way they arranged a circle of interacting influences, and thought that in so doing they had arrived at the inner secrets of nature. The human body they represented as under the dominion of the five elements, and the efficacy of all drugs is nothing but an exemplification in each case of the elemental action. Fever, for instance, is the domination of the element of fire, and must be expelled by a judicious application of the element of water.

From the elemental theory and from alchemy springs the whole nomenclature of medicine, the idea of the microcosm being added, according to which everything in heaven and earth finds its analogue in the human body.

From this way of looking at things Chinese medicine has never yet set itself free. The foreign physician resident in China finds, therefore, the native mind in regard to medicine besotted with prejudice and error.

When three centuries ago the Jesuit missionaries began to reside in Peking they taught the science of Europe as it then was to the wondering courtiers of the time. They could not make known the Copernican system. It was not accepted by the Church. Whether it was believed by the missionaries who translated Euclid into Chinese, and taught the natural philosophy then current in the Catholic seminaries of Spain and Italy, we do not know. However this may be, extant books show that they taught the system of Ptolemy in astronomy and of the four elements in philosophy. Perhaps this may account partially for the slowness with which the Chinese have during these three centuries received our ideas. Was the science taught by the early Jesuits much better than that which existed in China at the time? They were asked to abandon a belief in five elements and accept one in four. The Chinese were certainly behind-hand in their notions of geography; but, while it was an ecclesiastical offence for the Jesuit to teach the motion of the earth round the sun, there was no great advantage to be gained by the Chinese in exchanging his science for that of the western stranger. It was not till the eighteenth century that the doctrines of Copernicus and Kepler were taught to the Chinese by the Jesuits. They never seem to have made known to them the doctrine of the circulation of the blood and the modern history of European medicine.

It was in the old days of the East India Company that vaccination was introduced at Canton by Sir George Staunton and Mr. Pierson, an English surgeon. Since then about sixty-five years have elapsed, and the practice of vaccination is slowly working its way in the country. In the neighbourhood of Peking it is gradually supplanting inoculation. But it is left to private enter-

prise. Often the vaccine lymph has failed and new supplies have been obtained from Dr. Dudgeon by the native operators. In the absence of tubes it used to be the custom for the native vaccinators to take the children of the poor with them in a cart to the houses of the rich, who preferred to have their infants vaccinated at home from the shoulders of poor children, rather than have them taken to the public vaccinating institution. The native institutions in Peking, four or five in number, which existed there previous to the arrival of European physicians were founded by benevolent men returning from Canton, where they had held office for some years. Sir G. Staunton's tract was reprinted, but the name of England and of the discoverer of vaccination were omitted, probably at the time of the last war. The metropolitan vaccinators are appointed by a committee of gentry, and a small fee is charged for each child.

In the country private vaccinators go where they please, and in some districts they charge very high fees for the privilege of vaccination. No law or usage interferes with them, and if they demand twice as much for operating on a boy as on a girl public opinion is in no way outraged. It is the habit of the people to value boys more than girls, and the vaccinator takes advantage of this.

Dr. Dudgeon's Report shows that prejudice against foreign ways and opinions is gradually breaking down. After twelve years the hospital of the London Missionary Society in the capital of China continues to be a centre of good. During last year there have been 18,300 patients. The physician has added to his exertions in the hospital a lectureship in Anatomy and Physiology in the Government College. This has brought him into close contact professionally with the highest officials, several of whom he has attended in sickness.

The late Dr. Hobson, who during his long residence in China as a medical missionary translated several medical and scientific treatises, achieved by so doing a great fame among the Chinese. These books appear from this Report to be still in demand among Peking readers. Forty-eight copies are mentioned as being sold at the book-shop established in connexion with the hospital. A work on Geography and a large Map of the World are also greatly in demand. The increased sale of monthly and weekly journals issued by foreigners for the purpose of spreading useful knowledge in China is very gratifying. Political news, religious news, information on machinery, science, the benevolent institutions of Europe, accounts of travels, and all remarkable events, are thus communicated to thousands of readers whose knowledge of the world did not formerly extend beyond the *Peking Gazette*.

The Mongols look upon Peking as the eye of the world. Every winter they take refuge there in crowds from the chilling winds of their less happily situated country. They regard Peking as under the special favour of heaven, and perform their prostrations before the emperor with the most sincere reverence, from a confirmed belief that the liberty to do so is the greatest of privileges. It appears from this Report

that Mongols of all classes now come to the hospital to be cured in great numbers. Some remarkable cases are mentioned. Thus the fame of the hospital will become yet more widely spread in the "land of grass." All over Mongolia the physicians are Lamas educated in the Buddhist colleges and monasteries, where there is a medical course. The healing art taught is that of Tibet and so ultimately of India. Now the news will be conveyed to those extensive monastic establishments in Tartary which the lively pen of Abbé Huc has made known to so large a number of readers, that the English physician in Peking has performed marvellous cures on Mongol princesses, Lamas and others. They will probably represent in their reflections upon these things that the virtue and excellence of the Chinese monarch are so great that the English with their hospital and physician have been irresistibly attracted to live in the vicinity of his palace.

JOSEPH EDKINS.

Reminiscences of a Soldier. By Colonel W. K. Stuart, C.B., late 86th Regiment. (London: Hurst & Blackett, 1874.)

THE great merit of this book lies in what may be called its powers of typification and illustration in respect of English military life. In it we have a type of the British officer and soldier, the correctness of which few observers can fail to certify and acknowledge; and a succession of *quasi* professional scenes and stories characteristic of a period antedating at least half a century ago. The process by which the present altered status has been reached is easily traceable by those who care to undertake the investigation. But while we thank the author for many valuable as well as interesting and amusing data, we are not prepared to accept unreservedly his views and deductions. He seems to show too much of the side of the picture he commends, and too little of the side he condemns, to secure, on behalf of the former, an unprejudiced and impartial judgment. In his support of a particular school and system, much as our sympathies may be with his theories, we cannot ignore the absence of counter arguments of possibly great value. Nothing, for instance, can be sounder and truer than his sentiments regarding the treatment of the common soldier (Preface, page ix., and vol. ii. page 299), sentiments which are as politic as they are generous and kindly; but it is easier to inculcate the principle than to generalise the practice laid down. In forming the model officer contemplated, very much depends on the individual, his tastes, predilections, education, and the motives which have led him to adopt the profession of arms. What to Colonel Stuart has appeared easy and natural may have been incomprehensible to, and unattainable by some, perhaps many, of his fellows; and so would it also be in the case of his successors. There are many men whom a sensitive and retiring nature, or a sober and contemplative turn of mind, more or less disqualifies for that broad, open popularity which their brethren in the army have easily won and maintained; who possess, at the same time, qualities of endurance, abnegation of self, and a true chivalry which be-

long essentially to the soldier, and are, in fact, his choicest ornaments. Such men the service cannot afford to lose, and it is not too much to assert that such men, by influence and example, do the service incalculable good. On the other hand, how many officers are there whose social success and personal popularity are matters of course, to whom, however unequivocal their courage and honour, privation and endurance are, at least, difficult, and the monotonous routine of garrison and regimental duty is blank and irksome.

Happily the sneer at religion is no longer expressed in the vulgar and offensive form of days gone by; nor is the oath a part of education, or drunkenness a phase of training for rising generations of gentlemen. Dissipation and idleness have ceased to be conventional: no sensible study, professional or otherwise, is tabooed; and practical jokes have become restricted to almost reasonable limits. These and like social changes and reforms have affected especially the army; and, aided by the fusing and levelling spirit of competition, the result upon the service has been the loss of that exclusive and distinct character which it once possessed in the estimation of the masses; and a main feature of which was a sort of warranted exceptional "fastness." Whether improvement in one respect is detriment in another; or whether the general improvement has been greater than the general deterioration, must be a matter of opinion. To us there appears to be more cause for congratulation than lamentation; but a great deal remains to be done to arrive at that high standard of military efficiency in *morale* and *matériel* which it should be the privilege of this country to command; and there is no chapter in the whole of Colonel Stuart's book worthy of more attention on the part of our army legislators and reformers than the last, where he takes exception to the false position of the officer, the hard condition of the soldier, and the physical-degeneration of the recruit.

As a specimen of the book, many quaint anecdotes might with propriety be extracted, because the whole style is essentially light and desultory. And though all may not be new to every reader, more especially the frequenter of messes and military clubs, old soldiers will be the first to welcome the better part in a collective shape. The story of the matter-of-fact subaltern (pages 32, 33) is an example of very genuine humour. If we now prefer selecting from the more serious pages, it is because the reality of the author's description strikes us as remarkable, when recalling the suffering experienced on the occasion of the outbreak of cholera in June, 1846, at Karachi. His account, however brief, is forcibly and graphically given:—

"The regiment paraded at four o'clock for the funeral. It was a beautiful afternoon, with a clear blue sky, and not a cloud in the heavens. We had to march about six or seven hundred yards to the churchyard; and before we reached it, upwards of thirty men had fallen out with cholera, and of the men who composed the firing party, five were dead that night. The body had scarcely been placed in the ground when, almost with the rapidity of a change of scene in a theatre, the hitherto glorious atmosphere was at once over-

spread with a black lurid cloud. A frightful sand-storm followed; you could not see two yards before you, and the density of the air was such that it was painful to breathe. The soldiers were dismissed on the spot, and ordered to find their way themselves to the tents. . . . By twelve o'clock that night we had over one hundred men dead in hospital, and so violent was this first outbreak of the disease, that every man who was attacked on Sunday died."

Under orders from Sir Charles Napier, the 86th were removed out to Clifton, the name given to a high locality immediately overlooking the sea, marked by a few officers' bungalows; the comparatively fresh air of which renders it, on occasions of ordinary sickness, a desirable sanatorium. It was only a march of three or four miles from cantonment. Their arrival is thus recorded:—

"The scene baffled description. Cries of agony resounded on every side, and you hardly met a soldier that was not more or less under the influence of the disease. On many of those seriously attacked, I noticed a large black spot across the face, as if the Angel of Death had marked him for his own, and I cannot remember one of those so marked that recovered. Some poor fellows were absolutely as black as negroes."

Within ten days, the following is the result reported:—

"The 86th buried three hundred and eighty-five men, women, and children. The finest and most powerful men were swept away; seventy-seven grenadiers and light company men, the pick of the corps, were among the victims. . . . In fact, the regiment was all but destroyed."

Colonel Stuart dwells much on the pastimes of soldiers, and rightly considers that an officer should not be indifferent to the wholesome character of these or to the necessity of providing time for their exercise. He joins his men heartily in their outdoor sports; trains them for running matches, if necessary; but is not unwilling to trust them, for recreation at certain seasons, out of his sight and ken, and advocates strongly the system of "passes." There is one class of soldiers, and no small one, to whom natural bias, or it may be previous association, places the theatre far above all other diversions in interest and importance. And so long as it does not interfere with duty, or induce to drink or dissipation, amateur acting, even in the shape of melodrama and farce, is certainly as harmless, if not as healthy, as gymnastics or bowls, and more intellectual than either. Officers have much the same general fondness as the men for the stage, although their respective tastes may not always correspond as to the particular style of entertainment chosen.

The Poona theatricals will not yet have been forgotten by many who were at that busy Indian station twenty-three years ago; and to those among them who take interest in the stage heroes of the hour, and note the salient points of amateur histrionic efforts, the Claude Melnotte and Glavis of the *Lady of Lyons* and the Cox and Box of the succeeding farce, will not be the least agreeable reminiscences. We may mention that the author of the volumes under review played the first-mentioned character in each piece. In his book he reprints the play-bill of July 14, 1852; and as repetition may be accepted in proof of success, we have plea-

sure in bearing witness that a similar performance, with the principal characters filled by the same actors, had had effect on the same stage, on the 17th of the same month in the previous year. The soldier who then played M^{de}. Deschappelles deserved, in our opinion, great credit for his performance, despite the disadvantages of strange attire and deportment and a slight tendency to exaggerate. Pauline was, on the other hand, not subject to the hard ordeal of representation by one of the ruder sex; and the result, in this respect, was certainly a gain.

A great deal more might be said on these lively volumes—not only on the actual matter of the text, but on ideas which freely arise in the course of perusal. F. J. GOLDSMID.

NOTES AND NEWS.

"CASTLE DALY," which is now appearing in *Macmillan's Magazine*, is by Miss Keary, the author of *Little Sealskin and other Poems*.

MR. F. O. ADAMS, Secretary to the British Embassy at Berlin, has just completed the second volume of his *History of Japan from the Earliest Period to the Present Time*. It is to appear in October, and carries on the history of Japan from 1865 to 1871.

THE new buildings of Owen's College, which are set apart for medical studies, will be opened by Professor Huxley on Friday, October 2, at 3 P.M.

MR. S. BARING-GOULD has in the press a work entitled *Yorkshire Oddities and Strange Events*. The materials were accumulated by the author during a residence of many years in Yorkshire, and as "every other Yorkshireman is a character," the book cannot fail to be full of interest. Mr. John Hodges is the publisher.

WE understand that *The History of Protestantism*, which Messrs. Cassell, Petter and Galpin are about to publish, is from the pen of the Rev. Dr. Wylie. The work will be issued in serial form and will be commenced in October next.

THE *Arcadian* states that Messrs. Lippincott will shortly issue the long-looked-for *Life of Benjamin Franklin*, by the Hon. John Bigelow; and that Messrs. Putnam have in preparation a book by Professor J. M. Hart, on German Universities, comparing the German system with that of England and the United States.

MR. JOSEPH FOSTER's publication for 1875 is to be the *Pedigrees of the Historical Families of Lincolnshire*, as compiled by the late Lord Monson and Arthur Staunton Larken, Esq., B.A. In 1876 he proposes to issue the *Pedigrees of the Historical Families of Sussex*, compiled by the late Sir William Burrell, Bart.; and in 1877, the *Historical Families of Suffolk*, compiled by D. E. Davy, Esq., of Ufford. The last will be of special interest, as no Suffolk collection has hitherto been published. These are to form part of a *magnum opus*, to be entitled *The Pedigrees of the County Families of England*, two volumes of which will appear every year, uniform in size and style, in folio, with Berry's *County Genealogies*. This series will contain the pedigree of every county family with living representatives, that has hitherto been published, compiled from the *Heralds' Visitations*, County Histories, Parish Registers, Wills, and other trustworthy sources; and as the head of every family will have an opportunity of revising his pedigree, it will doubtless excel all its competitors in accuracy, and, being more comprehensive than other works of the same class, will be of correspondingly greater value. An engraving of the arms and crest of each family, heraldically drawn, will accompany each pedigree. This series will also contain the pedigrees of all those families which were entered

by the *Heralds* at their Visitations, and of which there are copies in the public libraries; they will also be worked up to some extent upon the same basis as the pedigrees of the existing families, so that if this plan be eventually carried out, we shall possess as perfect a series of English genealogies as can be compiled. Mr. Foster's plan is deserving of the support of historians, no less than of genealogists and antiquarians.

A MANUSCRIPT poem in the Bodleian, written by one Forrest, addressed to Queen Mary, and being a history of Queen Katherine, is to be printed at once by one of the members of the Roxburghe Club as his present to the Club.

THE late Bishop Sumner's literary reputation will rest chiefly on his edition of Milton's treatise *De Doctrina Christiana*, the original manuscript of which was not brought to light until 1823. In that year Mr. Robert Lemon, deputy keeper of the State papers, found it in what was called the Middle Treasury Gallery, Whitehall, loosely wrapped in two or three sheets of printed paper, with a large number of original letters, informations, examinations, and other curious records relative to the Popish plots in 1677 and 1678, and to the Rye House plot in 1683. The same parcel likewise contained a complete and corrected copy of all the Latin letters to foreign princes and States, written by Milton while he officiated as Latin secretary; and the whole was enclosed in a cover addressed to "Mr. Skinner, Merchant." Cyriack Skinner, to whom the twenty-first sonnet is addressed, was, we all know, Milton's favourite pupil and afterwards his particular friend; and it seems probable that the very decided Republican principles which Skinner had adopted made him an object of suspicion to the Government during the above-mentioned periods of disquiet, and led to the seizure of all his papers, including the precious manuscript entrusted to him by the poet. At the time of Mr. Lemon's discovery, Sumner was Librarian and Historiographer to the King, and by his Majesty's command undertook an edition of the original text, and a translation of it in English, in two quarto volumes. Another interesting point in connexion with this work is that it suggested to Macaulay the subject of his first acknowledged contribution to the *Edinburgh Review*, his essay on John Milton being headed with the title of Sumner's Translation.

WE understand that the first volume of the *Observations made at the Observatory of H.H. the Rajah of Travancore*, under the direction of Mr. Brown, F.R.S., is now through the press. This volume contains eighteen years' observations of magnetic declination made at Trevandrum, and four years' observations of the same magnetic element made at the Agustia Malley Observatory (6,000 feet above the sea). Reports on the work of the Director from 1852 to 1865 form an appendix to the volume, which will be published by Messrs. H. S. King & Co.

M. ALBERT DUMONT, Sub-Director of the French School of Athens, has just addressed a Report to the Ministers of Public Instruction, on the results of the mission of L'Abbé Duchesne and M. Ch. Bayet. These gentlemen left Rome in the beginning of February, passed through Epirus, visited part of Thessaly, and made a long stay at Mount Athos and Salonica. M. Duchesne also inspected the library at Patmos. The results may be summarised as follows: 1. 160 inscriptions have been copied, about 140 of which are unpublished, from Salonica, Macedonia, Larissa, Trikala, Kalabaka, &c. 2. M. Bayet has made a minute study of the mosaics of Salonica, which have no rivals in the East, except those of Saint Sophia at Constantinople, and has formed a collection of all the dated inscriptions which allow us to follow the history of art on Mount Athos—an indispensable basis for researches on Byzantine art. The two explorers photographed, at Salonica, a marble of the fifth century, bearing the Virgin, the Good Shepherd, the Magi, and a

winged angel. Sculptures of the first centuries of Christianity are very rare in the East, only five or six being known which represent religious subjects. This marble throws light on the history of Byzantine art, and the relations of symbolism in the East and the West in the fifth century. 3. M. Duchesne has made the following palaeographical discoveries: nine pages of metrological fragments of Julius Africanus; twenty-two pages of inedited scholia on the *Iliad*; nine leaves of the Caesarea MS. of St. Paul's Epistles; thirty-three leaves of a sixth century MS. of St. Mark's Gospel; unpublished scholia on Demosthenes, Aeschines, and Thucydides; Latin documents bearing on the relations of the Greek convents with the West, especially with the Court of Rome; a fragment of a Greek lexicon; the charter of the monastery of Barlaam. He has also drawn up a description of the principal MSS. in the Library of Patmos, and copied the classical portion of an Anthology preserved at the same place. Some further details of these important discoveries will be found in the *Journal Officiel* of the 18th instant.

DR. JULIUS ZUPITZA, of Vienna, has been for some time in England, collating and copying the MSS. of the various old romances of *Guy of Warwick*, with the view of publishing them in Germany. The Early English Text Society always meant to print these MSS. too; and two years ago Dr. James A. H. Murray collated for this purpose the printed text of the oldest MS. of *Guy*, the Auchinleck (or Affleck) with its original. But now Dr. Murray will waive his intention to edit this and the other MSS. in favour of Dr. Zupitza, so that the latter may, as it is hoped he will, edit the whole set of *Guy* romances for the extra series of the Early English Text Society. Dr. Murray's parallel-text edition of all the MSS. of *Thomas of Ercelesdown*, is now in type for the original series of the Early English Text Society.

WE are glad to hear of a Shakspeare club among the Professors of the College of New Jersey, Princetown, U.S.A. Professor Hart, of this club, whose late excellent paper in *Scribner* on Shakspeare's death-mask and portrait has attracted such favourable attention, is a leading member. The subject for the fortnightly meetings last session was, as it will be for next session, Shakspeare's acquaintance with the English Bible. The members read together both the minor poems and plays, and record every passage in which there is a quotation of Scripture language, and also every one in which either the thought or the language betrays familiarity with the Bible. When all Shakspeare's works have been exhausted, the members of the club will sum up their results and publish them. The former English books on the subject are not thought thorough enough.

With reference to the subject of Professor Hart's article in *Scribner* we may mention, on the authority of Mr. Butcher, the very courteous clerk of Stratford Church, who saw the examination made, that two years ago Mr. Story, the great American sculptor, when at Stratford, made a very careful examination of Shakspeare's bust from a raised scaffolding, and came to the conclusion that the face of the bust was modelled from a death-mask. The lower part of the face was very death-like; the upper lip was elongated and drawn up from the lower one by the shrinking of the nostrils, the first part of the face to "go" after death; the eyebrows were neither of the same length, nor on the same level; the depth from the eye to the ear was extraordinary; the cheeks were of different shapes, the left one being the more prominent at top. On the whole Mr. Story felt certain of the bust being made from a death-mask.

THE *Allgemeine Zeitung* states that the present director of the national library of Rio has made the interesting discovery that in the collection, known as that of the Abbot Diego Barbosa Machado, there are thirty-seven unique woodcuts by

Albert Dürer, bearing the date of 1511, and entitled "Figuræ Passionis Domini Nostri Jesu Christi." Besides these valuable relics of the old German master, the Machado collection is found to possess his celebrated "Adam and Eve" of the earlier date of 1504; and considering that this section of the Rio library includes a large number of books, prints and MSS. from the old Ajuda library, which were originally brought to Brazil by John VI. of Portugal, it is highly probable that a further search may be rewarded by the discovery of other artistic and literary treasures.

THE Roman papers announce the sudden death at Civitã Vecchia of Father Augustine Theiner, the learned theologian and writer on Roman Catholic Church History. Father A. Theiner, who was born in 1804, at Breslau, where he studied theology and jurisprudence, showed in early life a tendency towards the heterodox views of his brother, J. A. Theiner, and wrote, in conjunction with him, a treatise "On the Compulsory Celibacy of the Clergy and its Results." In 1833, after having made a scientific voyage at the cost of the Prussian Government, and visited Northern and Central Europe, he proceeded to Rome, where, in consequence of a change in his opinions, he was led to enter the Jesuit College of St. Eusebius, and thenceforth he continued to be a zealous member of the Society of Jesus. Theiner's scientific attainments were very considerable, and after his nomination to the office of Prefect of the Archives of the Vatican, he continued to prosecute his researches with great industry, while he availed himself of the historical sources opened to him to produce numerous works bearing upon the history and development of the Papacy. Among the most noteworthy of these are his *Clementis XIII. epistolæ et brevîa*; his historico-critical Letters on Rosmini Serbati's *Cinque Piaghe della Sta Chiesa*; and his editorial annotations on the works of Baronius, of which he brought out about half of the sixty quarto volumes in which they had originally been collected. The great task of his life was, however, the completion of the *Annales Ecclesiastici*, begun by Baronius, and the annotation and edition of a large number of original documents and other papers relating to the church history of different Christian nations, which were printed under his special supervision in a printing press within the Vatican. During the latter years of his life it was understood that although he continued to reside at the Vatican, Father Theiner had ceased to be connected with the Archives, in consequence of his having made public, without authority, certain official documents relating to the questions to be discussed at the Council of the Vatican on the Doctrines of Papal Infallibility and of the Immaculate Conception. It is now, however, stated that these revelations were actually made by Father Theiner's brother. At the time of his death, Theiner was on the eve of undertaking a journey to Trieste and Austria, on his return from which he had intended to retire into private life, and devote himself still more uninterruptedly to his literary labours.

THE Bibliothèque Nationale is gradually letting a few shafts down into its unexplored mine of wealth. Hitherto the student has generally been compelled to sound and probe at hazard, unless he happened to be on friendly terms with one of the presiding officials. It is known that the Catalogue of the Bibliothèque—which for the last twenty years has been advancing at about the same rate as the Dictionary of the Academy—is composed of many minor catalogues, embracing special subjects. The last report of the Library Administration informs us that in the Print Department the Supplement to the Catalogue of French History has made good progress; it had stopped short at 1798; now it has reached 1830. The third and last volume of the Catalogue of Medical Sciences is in the hands of the printer. In addition to this work of impression, the manuscript inventories are being formed into

volumes. In theology, including canon law, there are already thirty-nine folio volumes, and in English history thirteen volumes. In a few months the reader will have at command printed catalogues of 441,836 works relating to the history of France; of 68,483 volumes on medical science; and manuscript enumerations of 199,499 works on theology; 19,243 on English history; and 28,447 on the histories of Spain, Portugal, Asia, Africa, America, and Australia. The catalogue of Syriac and Sabeian manuscripts—a supplement to the catalogue of Hebrew and Samaritan manuscripts—has just been published. The 19,800 Latin manuscripts have been classed, and will be catalogued as follows: sacred history, one volume; liturgy, one; the Fathers of the Church, and divers theological works, two; law, one; general history, one; history of France, two; science, one; and literature, one. The report terminates with the announcement that the printed collection of the Bibliothèque amounts to 2,077,571 volumes.

At a recent meeting of the Academy of Inscriptions, M. Mariette read a paper on a discovery recently made at Karnak. The excavations under his charge have brought to light a kind of triumphal arch, dating from the seventeenth century B.C., and built in honour of Thoutmes III., one of the greatest conquerors among the Kings of Egypt. The King is represented four times, of colossal dimensions, holding a captive with his left hand and a scimitar in his right, while a god is bringing him several hundred persons in chains, who represent the towns and people vanquished by him. The names of the districts conquered by Thoutmes are inscribed on this monument, comprising two distinct lists, one for the south and one for the north; in the former are 269 names, in the latter 359. The first list includes four parts: Couch (Abyssinia), 47 names; Pount, (40 names), formerly placed by Brugsch and others in Yemen, but which is now proved to be the part of the African continent from the Straits of Bab-el-Mandeb to Cape Guardafui; Southern Libya, 29 names; Nubia (i. e. parts of Upper Nubia and Soudan not explored in our days), 153 names. The second list is divided into two parts; the first relates to Canaan, and comprises 119 names, divided into 7 groups, of which the first forms the title, and the 6 others comprise each a certain number of towns; 75 of the towns named have been identified with known places. So we have the geography of Canaan 250 years before the Exodus, and M. Mariette has drawn up a map of the country according to the new document. The general result of this discovery is to place at our disposal more than 600 geographical names of the time of Thoutmes III.; these names bring us on the South from Abyssinia to the country of the Ayalites, Southern Libya, and the district of the Upper Nile; on the North to Canaan, and thence to Asiatic countries which the present state of our knowledge does not allow us to identify.

NOTES OF TRAVEL.

THE *Journal de Genève* states that the ascent of Mont Blanc has just been effected by Charles Rand, a native of Chicago, only fifteen years of age—probably the youngest tourist who has ever reached the summit. The *Journal* adds that the youth is a member of a temperance society, and took nothing but water and melted snow.

THE members of the Geological Society of France are about to make an excursion to the environs of Mons to study the tertiary and calcareous formations of Hainault. The first meeting will be held at Mons on August 30, and any person desirous of participating in the excursions and in the fêtes that will be given on the occasion, will, on sending fifteen francs to the secretary at Mons, receive a card of admission.

A LETTER printed in the *Opinion Nacional* of July 11, gives a description of Quito, where many Indians live, as well as in the neighbouring villages, who still speak their own Quichua tongue.

It gives a few words as examples:—"Chasquinada munan quichu (wilt thou have) Doña Rosada, caibi presente tiajum (Doña Rosa who is here present), cambay legitima guarmi gachum?" (for thy lawful wife)? "Auchuri caimauto" (go from here); "Aichada micui" (like flesh); "Yacuda apamuy" (take water); "Pinguda pascay" (open the gate); "Amá fiña cuicui" (don't hurt me); "Ñia chue confesar gangi? Mono, Cristo de la tierra" (hast thou confessed. No Christ of earth—so they call the priests). This last phrase will show the power which the *padres* possess. The Indians confess in Quichua; though for the most part they speak also Spanish, especially the younger men. From the few sentences which are given, it is evident that this dialect is very much adulterated.

THERE has been a fresh outburst of blind popular resentment against the Jews at Magnesia, owing to the ignorant belief of the Christians that the Jews kidnap Christian children, for the purpose of using their blood in the preparation of passover cakes. The death of a Turkish child under peculiar circumstances was used as a means of inflaming both Greeks and Turks against the Jews, but fortunately the Turkish authorities acted with vigour and firmness, and prevented the bloodshed that was imminent.

FROM Bengazi, under date July 4, we learn that a plague or pestilence of a very alarming nature has broken out in Barbary. Its chief stronghold is the village of Marsh, about twenty hours from Bengazi. It arises from the pernicious habit the Arabs have of digging their wells close to their cemeteries, the graves of which are so lightly covered with earth that the heavy rains wash off their coverings, and convey the impure matter beneath to the wells. Added to this there has been great misery this winter in Marsh among the Arab tribes; the animals died in numbers, and were left unburied, poisoning the air around. The first appearance of the plague was in the month of March, when it broke out amongst the tribe Lit Istanik. It continued to spread, and on June 8 it was declared to be the veritable plague by Dr. Laval, who was one of a medical commission sent from Bengazi to enquire into the nature of the epidemic. He has since himself fallen a victim to its attacks.

A CORRESPONDENT of *La Turquie*, writing from Jerusalem, mentions the researches that are now being carried on by Mr. Mosely at the foot of Mount Zion, and in and within the Protestant cemetery. He states that large cisterns filled with clear pure water have been brought to light, also baths hewn out of the rock, all evidently dating from the Moabitish epoch. The same writer states that the English Society for the Exploration of Palestine have found, in the plain of Ramlek, a very valuable marble tablet, with a Greek inscription and also some obscure Hebrew inscriptions. The German Consul having claimed this valuable relic, as well as the English Society, it has been handed over provisionally to the local authorities till the dispute be settled. It is to be feared, however, when the value of the discovery is known, that the Turkish Government will claim the tablet for themselves.

DR. GEORGE SCHWEINFURTH is at present at Riga, where he intends to remain till he has completed the arrangement of the various extensive collections of plants which he has brought with him from Africa. It is reported that an extensive and valuable collection of African plants has been bequeathed to him by an English traveller now deceased, and this will be incorporated with his own to form one great systematised compendium of the flora of Africa.

WE learn that Professor Raimondi, the Italian geographer and naturalist of Peru, well known for his researches, which have been conducted for upwards of thirty years in that country, has just published a remarkable work on the mineral resources of the environs of Huaraz. Great attention is now being devoted to mining in Peru.

Considerable progress has been made with the construction of railways in the north (the most fertile portion), and the Government has agreed to pay the passage from Europe of all geologists, mining engineers, and others, who may be deputed to Peru by societies possessing not less than twenty-five million francs capital.

AN interesting paper on the subject of precious stones appears in a recent number of the *St. Petersburg Gazette*. M. Gilson, the author, has just completed a journey round the world, undertaken for the express purpose of making enquiries into this branch of trade. From his researches it appears that, owing principally to the plentiful supply from the South African fields, diamonds are at a lower price than they have been for ten years past. Pearls and emeralds, on the other hand, are at a premium. At New York an opal about the size of a moderately-sized olive would fetch, at the present time, about 1,200 roubles, a sapphire of the same size would be worth 1,800 roubles, an emerald 10,000, a diamond 18,000, and a ruby 50,000. In Europe these prices would vary somewhat, opals and sapphires fetching more and emeralds less. Pearls are now brought from Central America, California, and the Persian Gulf, but they none of them rival those of the East Indies. The diamonds annually imported from South Africa into America are worth about seven million roubles, and the importation into Europe averages about the same. Many of them are of good size, and nearly all without exception of a yellowish tinge, the consequence being that diamonds of similar colour have actually gone down 75 per cent. in the market. Diamonds, indeed, would have fallen lower in value had it not been that the realisation of enormous fortunes in America through petroleum and military contracts created an excessive demand. A similar depreciation in the price of diamonds was occasioned at the time of the discovery of the Brazilian diamond mines, Golconda having previously supplied the market. But the stones soon regained their original value, and it may be confidently expected that the effect of the African diggings will be also merely temporary.

In an article on "one of the Indian Outbreaks," the *Nation* has some remarks which will interest many of our readers:—

"One of the old and just Indian grievances, one of their excuses for their early assaults upon travellers on the Santa Fé trail and the Platte route, was the unnecessary killing of buffalo. The protection of the buffalo and the utilisation of the entire carcass when slain is a strong point in their character, and its wanton destruction excites great indignation. With the spread of settlements the grazing limits have yearly grown less, and now that railroads penetrate the heart of the range very many thousands of these animals are annually slaughtered, both in and out of season, with no intention or possibility on the hunters' part of taking a tenth part of each. Some shoot them for their tongues, some for their hides (not for robes, but as a heavy leather). Some actually cut the shaggy hair to mix fraudulently with coarse Mexican wool; some ship the hind-quarters East for food. In certain localities the dead may be seen as thick as horses on a battle-field, polluting the pure air with a horrible stench. It is understood that in the last treaty with the tribes before mentioned, it was provided that buffalo should not be hunted by the whites in the country south of the Arkansas. If this article exists (and they believe that it does), the whites no more regard it than do the buffaloes themselves respect the parallels of latitude. The hunters are ubiquitous, and the herds are fast being destroyed. Indeed, systematic extermination of this animal is seriously advocated by many as the speediest solution of the Indian problem. on the ground that when they are gone the Indians must starve or become perfectly docile. Meanwhile this flagrant violation of their treaty-rights excites their bitter anger, and last year they sent direct messages that if their cattle (the buffalo) were thus hunted they would compensate themselves among the white men's herds, which are now so extensive and valuable on the upper Arkansas."

As a necessary complement to the street railways which have been lately opened to connect the lower with the upper town of Bahia, in Brazil, we hear that to avoid the extreme gradient of the principal hill, a powerful hydraulic elevator was likewise opened to the public at the end of last year, an improvement so great, especially for the commercial community, that from 4,000 to 5,000 persons daily avail themselves of it, thus superseding the classic Bahia sedan chair carried by negroes, which for more than one century was the only mode of reaching the upper from the lower or commercial town. Many of the sugar planters in this district, in consequence of a disease difficult to eradicate which has attacked the sugar cane, have turned their attention to coffee planting. A similar experience was undergone at Rio de Janeiro, between the years 1816 and 1824, when the planters of that province abandoned for the same reason the culture of the sugar cane for that of coffee, a change which led to immense progress and great accumulation of wealth in the capital of the empire.

OFFICIAL reports from Carthagena, in Columbia, tell us that a party of American and Canadian miners, nineteen in number, arrived there from New York a few months back, styling themselves the South American Joint Stock Mining Company, to proceed up the River Sinn to "prospect" for gold; they brought with them a steam gold washing apparatus. It is well known there that rich gold mines existed and were worked in the neighbourhood of the Sinn by the Indians, but were skillfully concealed by them on the Spaniards taking possession of the country, since which time all trace of their whereabouts has been lost. Gold dust has for a long time past been constantly washed out in considerable quantities by the natives living on the banks of the Sinn, but whence the river brought down this dust has never yet been discovered, owing partly to the great difficulties to be encountered in exploring the country (which is one vast forest) through which the Sinn flows. The chief of the above-named expedition, however, assured Consul Mallet that they intended to overcome all obstacles, and were determined not to desist from their search until they had traced out the sources of the gold dust.

SELECTED BOOKS.

General Literature and Art.

- COKAIN, Sir Aston. *The Dramatic Works of*. With Prefatory M.M. Ir. Introduction, and Notes. Edinburgh: Paterson.
 FOSTER, J. *Pedigrees of the County Families of Yorkshire, North and East Riding*. W. Wilfred Head.

A LONDON ALDERMAN'S JOURNAL, 1796-7.

(Continued from page 182.)

"MONDAY, 14 Nov. Exceedingly cold and raw. The report of the Chamberlain's death seems to be premature; he is better and gone into the country. I dined with J. P. and B. Collett, our drowsy companion.

"Tuesday, 15 Nov. A fine day but cold and towards evening rain. Paris papers of the 9th, but nothing further respecting the negotiation. A proclamation in Ireland states certain counties in a state of insurrection. The storm approaches, stocks fell 1 per cent. Dined with J. P. at the York, an admirable pick, intending to go on to Drury Lane to see *The Conspiracy* by Mr Jephson for the first time, but as usual sat too long, being joined by Mr Rowland Webster from Stockton. When I parted with my friends, as the saying is, I fetched a walk to stretch my legs. I walked up Holborn, Oxford Street, New Bond Street, St. James's Street, Piccadilly, the Strand, to an oyster shop, very decently fitted up in Mitre Court, Fleet Street, where Mr Webster promised to meet me, but did not come. I had however some very good oysters, called for half an hour at the York, and in bed at twelve.

"Saturday 19 Nov. 1796. . . . Yesterday began the election for the Boro' of Southwark—one member—George Tierney and George Woodford Thelluson, Esq. Candidates. Tierney was proposed by Alcock and Thelluson by R. Carpenter Smith. The former returned, and a poll demanded. Numbers at conclusion of the day were Tierney 487, Thelluson 316. My cordial wishes go with Tierney, advocate for the people.

"Tuesday, 22 Nov. On Saturday Mr Ellis the confidential friend of Lord Malmesbury arrived in town from Paris. The precise object of his return it is impossible to say and every conjecture may be void of truth, but it is not improbable to believe, that he is sent over to inform our administration of the real state of affairs, and to give other information of circumstances which his Lordship may not think it proper to commit to paper. . . . On the end of the second day's poll the numbers were Tierney 823, Thelluson 810.

"Wednesday 23 Nov. The third day of the Boro' poll terminated viz. Mr Thelluson 1283 Tierney 1119 Majority 164.

"Paris papers up to the 19th were received, but extremely barren of intelligence, if we except a very interesting correspondence which took place on the 12th and 13th between Lord Malmesbury and Charles Delacroix, the result of which his Lordship sends home by Mr Ellis private. The Frenchmen display no ambiguity but at once publish the whole. Monsieur Delacroix ask 'Whether on each official communication it will be necessary for Lord M. to send home a courier to receive fresh instructions?' His Lordship asks 'Whether he is to consider the note official?' The Frenchman says 'Yes,' and away goes Mr Ellis. How is it possible for the Frenchmen to know even the disposition of the Emperor towards peace. It appears clearer than daylight, nay, Lord M. acknowledges, that he has no power, and his instructions as clearly state that he has no power from us to treat without the Emperor. Where then or how is it proved that on our part there is any sincerity in this negotiation? I believe there is none.

"The Lisbon mail, that the Court of Portugal has given a decisive answer to the Court of Spain that she is resolved at all hazard to adhere to her engagements with Great Britain. Of course Mr. Bull must send her money and stores!

"Friday 2 Dec. 1796. The frost still continues with equal if not increased severity and skating going forward in every quarter where water is, and boys sliding in every street. Men are clad in their great, or their little great-coats, and the ladies appear gay in their spencers and furs. I never recollect weather so very severe at so early a period of the year. Large bodies of ice I saw floating on the river without the aid of snow, and every indication of a hard winter.

"The Prince of Wales has been to Bath and received the freedom of the city from the corporation, presented in a most fulsome panegyric on his Royal Highness's virtues, in a speech from Mr Palmer the mayor, which must nauseate the prince if he has sensibility left, and disgust the nation, when it is notorious that there is not a man of honour in the

country who does not reprobate his conduct and say that he is a disgrace to his rank. I am for one ashamed of such adulatory compliments. Capt. Shaw called about three, but he was engaged to dinner. We walked as far as Queen Street together. I then called on Mr Sadler in King's Arms Yard, but he had select friends, and from thence to Mr Turnbull's but the house was shut up. . . . I had then no alternative, I retired to the York and dined solus at the expense of 6/, but the evening afterwards hung heavy; I saw no person calculated for conversation who was not engaged. I read all the papers both of town and country, and I had no books. Eight o'clock arrived, but still I had two or three hours on hand. I resolved to walk over the bridges, and return through the Strand. The weather was exceedingly cold and the streets very slippery and disagreeable. I again dropped into the York. I found the same persons there whom I had left; I had oysters for my supper and a glass of punch and went to bed soon after ten, having passed as comfortless an afternoon as I ever recollect to have experienced in London or elsewhere. Without pen ink or paper I believe that I should very soon wither in the midst of plenty.

"Tuesday 6 Dec. Cold and frost still continue. . . . On the river the oldest man scarcely remembers so much ice at so early a period of the season and particularly without snow. . . . The letters from Buonaparte and Alexander Berthier to the Directory are published in this day's papers. The conflict continued with little or no intermission for three days at in or near Arcole, which will be recorded famous in history from the event. The battle was fought with enthusiasm on both sides, but at length on the 17th of Novr, the Austrians under General Alvinzi gave way. . . . Buonaparte manifested all the points of a great military character—he was everywhere in the battle—he fought on horseback and on foot—and at one time, when his troops were giving way, called out 'If ye are the men who obtained the battle of Lodi, follow me,' rushing on at their head amid a torrent of fire, gave a turn to the fortune of the day, and added to his arms new wreaths of glory and honour. He was well seconded by Argeteau and Massena, but several other general officers fell, two killed and five wounded. Their loss must have been considerable, tho' it is never mentioned. It was intended the next day to attack General Davidovitch which must decide the fate of Italy. Buonaparte says it will fall in a fortnight. Mr. Nutt says never! . . .

"Capt. Shaw dined with me at the York rather early, and afterwards went in time to get a place in the pit of Drury Lane. Miss Farren on Tuesday last disappointed the public by not appearing when her name was advertised to perform. In consequence the play was changed, and the letters which appeared in the papers were not thought sufficiently explanatory or satisfactory. This evening was represented for the first time the same play which was to have been performed on Tuesday, *The Force of Ridicule*. Miss Farren appeared in the first scene and was received with perfect good humour by the audience, and the very slender tokens of disapprobation which were attempted were soon silenced by the general & united plaudits of a crowded theatre. Mr Wroughton made an apology for the author, and the play was suffered to proceed. It had a patient hearing to the end with very slender interruption, and then condemned *and* *voce*. Who the author is I know not, but since my knowledge of the Theatre, which now is no inconsiderable portion of a man's life, I never saw so puerile, so ridiculous, so stupid, so uninteresting a performance, devoid of every point that ought to constitute a comedy. *Richard Cœur de Lion* was the after piece, but I did not stay. I stretched away to Mr Nutt's, where I eat my bread and cheese and returned at half past eleven. . . . Francis Dunn and Will. Arnold were yesterday executed for murder, and the first malefactors conveyed to the new Surgeons Hall in Lincoln's Inn Fields. They were conveyed in a cart, their heads supported by ten chests for the public to see: I think, contrary to all decency and the laws of humanity in a country like this. I hope it will not be repeated. At a Court of Common Council yesterday £100,000 was agreed to be subscribed to the loan, but where the money is to come from the Lord knows.

"Wednesday, 7 Decr. 1796. Cold, raw and unpleasant. Dined very comfortably at Mr Nutt's with Mr Geo. Lempriere. Excellent pea-soup, meat pie, doe venison, two broiled haddock, shoulder of veal

admirably roasted, rice pudding and toasted cheese. Played two rubbers at whist, bread and cheese for supper, and home at twelve. . . . James Dyer was this morning executed for forgery. On Sunday several persons lost their lives on the Serpentine and in St. James's Park. I believe there are more fools in this town than in any place on earth.

"Thursday, 22 Dec. A Committee of the House of Commons pronounced George Tierney Esq. duly elected for the Borough of Southwark, and George Woodford Thelluson, Esq. not duly elected. The Clerk of the House amended the return accordingly when Mr Tierney took the oaths and his seat. A more important decision is not recorded in the history of the House of Commons, and tho' it is with truth to be declared that the body in mass (at least the majority) is servile and corrupt, yet when a point is referred to a Committee of individuals, they always decide as men of honour, having no bias in their conduct, but the law of justice and truth.

"Saturday, 24 Dec. Papers this morning announce positively the failure of Lord Malmesbury's mission; that he has been ordered to quit Paris in 48 hours, and is expected daily in London. Stocks fell three per cent, and may now be stated at 55. I dined at Mr George Field's with James Tatlock, &c. . . . Harvey Combe and Mr Jeffries, member for Coventry, who came direct from the House and said that Mr Pitt had in form communicated the failure of the Embassy, and that on Monday he should bring down a message from the King on the subject.

"Dec. 25. Christmas Day and perhaps the coldest ever remembered in the country; the thermometer is stated to have fallen to 28½ degrees below freezing point. I was at my lodgings till near four . . . took place in the Bedford Coach for to-morrow, slept at the White Hart. A fire this morning took place at the Rose and Crown, which threatened the neighbourhood but was happily extinguished. Mr Nutt conceives the multitude in Paris so bent at all hazard on peace that Lord M. will not be permitted to come over! *Nisiun tenetis!*

"Dec. 26. In the coach at five—arrived at Bedford at half-past two. My companions were a Mr Fisher and others of the same profession whose names perhaps were never recorded before, unless at their baptism; they were collectors of eggs, and of cocks & hens, &c., for the poulterers in London. Mr Cockman dined with us; I was rather fatigued and went early to rest.

"Thursday, 29 Dec. Left Bedford at half past ten, & arrived in Bridge Street at nine. Supped at John's. New loan for 4 to 5 discount, a blessed prospect for the subscribers!

"1797.

"Thursday, 12 Janr. Yesterday an address from the City was presented to the King, when William Horne an obscure attorney in Paternoster Row, and late elected alderman of Castle Baynard in the room of Sir John Hopkins, was weak enough to follow the example of his predecessors and returned home a knight. If there is a contemptible title on earth, it is this kind of knighthood. . . .

"Tuesday, 17 Janr. Considerable fires have happened in New York, Boston and Savannah, imputed to the villainy of the French emigrants, whether so or not, 'tis impossible to say, but there is nothing so atrocious and diabolical of which a Frenchman in my opinion is not capable, and therefore tho' many unfortunate and worthy people may suffer, yet if I had the rule of the Roast, not one single French person should be permitted to remain in this country.

"Wednesday, 18 Janr. Her Majesty's Birthday, and as such observed at Court, which I understand was not so numerous or brilliant as it sometimes is. The houses of some tradesmen were illuminated *ex necessitate*, and so was the Mansion House according to custom. . . . In the evening I sauntered to John's where Mr Alderman Curtis soon joined us. He had dined very pleasantly, he said, at Mr Pitt's in Downing Street with a party of about twenty, an admirable good dinner and good wine and plenty of it. I had no doubt of it, and the worthy alderman I am sure had had his proportion of it.

"Monday, 23 Janr. Mr. Dick and Mr. Andrews again dined with us; afterwards we pushed for Covent Garden Theatre. The house overflowing—with difficulty got a back seat in a side box up two

pair of stairs. *Cure for the Heartache*, a new esteemed fashionable Comedy from the pen of Mr. Morton was the play. If I did not know to what a miserable ebb the Drama is reduced I should have been surprised to see so many people sit so long patiently to hear such stuff! a collection of trash just calculated to hit the depraved taste of the times. Coming from Bedford some weeks ago with Mr. Madox the brewer and speaking of beer, he said 'As long as you continue to drink the liquid which we give you for beer, we shall never give you better,' and so I fear it is with the drama—as long as the town can listen to and laugh at such stuff as the *Cure for the Heartache*, there is very little chance for the revival of chaste and ancient Comedy. *The Jealous Wife*, *Clandestine Marriage* both by the elder Coleman, and *The School for Scandal* & *The Rivals* both by Sheridan are the only plays that I recollect to have escaped oblivion since I first attended the theatre, which is now thirty years. *Harlequin and Oberon* was the pantomimical farce, in which was introduced the Fantochini or dancing figures which was the only part of our amusement that I thought worth attention, for even the pantomime was poor. We eat oysters in Mitre Court and spent an hour afterwards at the Globe.

"Friday, 3rd Febr. The night before last a notorious offender named Lancaster was shot near Whitstone by Lord Strathmore. Paris papers arrived in date 27th ulto, with an account of the most important news that the Austrians in their attempt to relieve Mantua had been signally defeated in five battles fought with most distinguished valour by the successful Buonaparte, and the Austrians by Alvingzy, in which the latter lost 6000 men killed and wounded and 25000 prisoners, &c. with all the oxen, grain, and other provisions destined for the relief of the besieged town. Such is the account subscribed by Buonaparte and Alexander Berthier, but still there is a certain class of men who will not believe anything that they wish not to be true. . . . Government have received no official accounts. How the devil should they, unless they could receive them in balloons? . . . Such is the wonderful success ascribed to the good fortune and talents of this prodigy of Man in Arms—Buonaparte—whose fame stands recorded infinitely beyond what we read of either in ancient or modern times. The Alexanders and Caesars of whom we have read, the Aungzebzes and the great Zingis of the East shrink into nothing when compared to the mighty achievements of this young warrior. This conquest in my opinion decides the fate of Mantua, and the possessions of the Emperor in Italy; probably in the event it may procure for them a separate peace, notwithstanding the repeated and constant declaration of Mr. Bull and his associates that as he, Mr. Bull, will not treat without the Emperor, that the Emperor will not treat without Mr. Bull. Time will shew. I dined with Mr Parkinson, & afterwards supped with Mr. Nutt, who waits for particulars from the adverse side, loath to admit what he is afraid will prove true.

(To be continued.)

AMERICAN NOTES.

Boston, Mass.: July 31, 1874.

A VERY fair attempt at novel writing is Mr. Frank Lee Benedict's *John Worthington's Name*. In general, we have to depend for novels upon publishers' selections from your full English lists for reprints. These make about nine-tenths of all we get, in addition to which are a small number of American novels, and a great many translations, especially from the German. *John Worthington's Name* is very readable, and if it is not taken for too literal a copy of the excesses of New York society, it may be commended. Much more worthy of note are Mr. Charles Francis Adams' *Memoirs of his Father, John Quincy Adams*, the second volume of which has just appeared. They consist almost entirely of his diary, and a great part of this, and more especially of what is contained in the first volume, is very far from exciting. There is none of the levity that cannot but make a diary interesting with its fresh jotting down of striking incidents, but in place of that there is a very serious, and at times amusingly pompous, record of his daily life, with very conscientious moralising upon it. The first volume carries his

diary down to the date of his appointment to the Russian mission, and the second is for the most part filled by his account of his sojourn in that country. Although few readers will be tempted to this book by the picture it gives of Mr. Adams, there is a great deal in it that is interesting to those who care for the history of this country during the last hundred years. More especially will this be true of the later volumes.

The autumn announcements of the publishers are not complete yet, and their shortened lists will probably show some of the ill effects of last year's panic. Osgood & Co., of this city, however, are to publish a new volume, *Poetry and Criticism*, by Mr. Emerson; Mr. John Fiske's *Cosmic Philosophy*, which will appear simultaneously in London; *Chemical and Geological Essays*, by Professor T. Sterry Hunt; a new volume of poems by Dr. O. W. Holmes; a drama by Mr. Bayard Taylor; and a new novel, *Idolatry*, by Mr. Julian Hawthorne, son of the great Hawthorne. This gentleman's earlier novel, *Bressant*, some of your readers may recall; it was very warmly praised in England, much more so than in this country, where the inheritance of his father's genius was less vividly detected. Dr. E. H. Clarke, who has raised a mighty tempest by his book, *Sex in Education*, is writing a new volume on the education of girls. The discussion has already crossed the water; for a time it was very hot here. Various persons felt aggrieved at some of his remarks, and answers to what he said were very numerous. Such were *Sex and Education*, *No Sex in Education*. With us this is a very pressing question, and those who frown on all distinctions of sex are very merciless in their treatment of their adversaries, giving no quarter. Meanwhile, the question is coming much nearer settlement, and in the best way, by being taken out of discussion, and having something practical done about it. Only a few weeks ago Harvard College held its first examinations for women. The applicants were very few in number, less than a dozen, in fact, but although the official report has not yet been published, it is understood that they did well. The professors of the college had the entire charge of the examinations, but the credit for arranging the details, and that in the face of some opposition and considerable indifference, belongs to a number of ladies of this city. The plan is based upon the system of the Cambridge examinations for women.

At the recent annual meeting of the Philological Society at Hartford, Dr. J. Hammond Trumbull read an interesting paper on the Indian method of notation. In general, the American Indians counted either with their fingers alone, or with their fingers and toes, but in Paraguay some of the tribes counted only to four, and expressed that numeral by a word meaning ostrich-toes. Professor Whitney, of Yale College, read a paper on the Proportional Elements of English utterance, in which he gave some rather curious results of his investigations. He chose passages from Shakespeare, Milton, Gray, Bryant, and Tennyson for poetry; and from the English version of the Bible, Dr. Johnson, Goldsmith, Carlyle, and Macaulay for prose; and read aloud until he had uttered a thousand sounds. The proportion of vowels to consonants he found to be 37·3 to 62·7, a trifle greater than the German, but less than the French, 40; Gothic, 41; Sanskrit, 42; Latin, 44; Greek, 46. Their ratio in English is as 1 to 1·682. The average number of syllables in a word he found to be 1·358.

We are expecting the speedy arrival of the Duc de Montpensier's collection of paintings, in preparation for which the exhibition of Mr. Sumner's collection closes to-morrow, in order to make room for the Spanish pictures. This collection is of very meagre interest; many of the engravings are of value, but the pictures only shine by an absence of positive worthlessness. They were so much better than those any other member of Congress would have bought or commended, that they have

given Mr. Sumner great fame as a patron of the arts. He knew enough to oppose most of the claims of "lobbying" artists, and for that, although he was not always successful, he deserves our gratitude. When one thinks of the way the Duc de Montpensier's pictures will be received in this country, and of the wretchedly lit, squalid hall in Seville into which some of the best Murillos are crowded, one grows jealous of the Spaniards, and very much dissatisfied with the present distribution of the works of the old masters.

T. S. PERRY.

CORRESPONDENCE.

DR. SCHLIEMANN AND THE EXCAVATIONS ON THE ACROPOLIS.

Athens: August 6, 1874.

You will have seen that, from motives unknown to me, but probably on account of my still pending suit with the Turkish Government, the King of Greece has cancelled the permission granted me by the Ministry, to demolish the great Venetian Tower in the Acropolis. But since His Majesty seems to have no objection to the work being done by anybody else, I have at once paid the cost of the demolition, say 13,000 dr., or 465*l.*, to the Archaeological Society here, which has agreed to employ the money for the purpose.

I avail myself of this opportunity to make a few remarks on the *Treasury of Minyas* at Orchomenos, which I have just visited on a tour through Northern Greece. This monument is built of fine white marble, but for the rest in the same style as the well-known Treasury of Atreus at Mycene. Each stone is provided with two small, but very deep holes, and in many of them remain points of the brass nails, which retained the brazen plates of the interior covering. The large block, which covers the door, must have been ornamented in a different way, for it has two large and two small holes. Only about one half of the subterranean dome remains, the whole upper part having been destroyed by the pious zeal of the builder of the church, which seems to occupy the precise site of the sanctuary of the Graces in the precincts of the monastery. Most of the marbles have been used for the floor of the church, the rest for the walls. The chronology of this spoliation I find in the two inscriptions, in a barbarous Greek, which are fixed in the church walls, and which attest that the church was built in the year 6382 after the creation of the world, i.e., in 874 after Christ, or exactly a thousand years ago. The great hollow around the Treasury, and the heaps of rubbish above it, prove that the builder of the church has had to make a large excavation to get out the stones, and that the monument must have been both filled and covered with rubbish. The second spoliation was perpetrated only twelve years ago, in 1862, by the present mayor (*δημαρχος*) of Orchomenos, Mr. Sgourdakes, who has dug up and removed all the marble blocks of the long and broad approach, or passage, which led through the slope to the door of the Treasury, and employed the stones to build a new church, although the three already existing churches were four and six times sufficient to hold all the inhabitants of the town and the adjoining village. Several of these marbles were of such immense proportions that the mayor was able to cut columns out of them.

King Minyas must have reigned several generations before the time of Homer, who only mentions his name as an epithet of the city "*Ὀρχομενίους*" (Ilias II. 511). The Treasury was in a perfect state of preservation when visited by Pausanias in the second half of the second century after Christ, for he writes, (IX. Chapter 38): "*Θησαυρὸς δὲ ὁ Μινυῖον αἶμα τῶν ἐν τῇ Ἑλλάδι ὄντων καὶ τῶν ἐτέρωθεν οὐδενὸς ἕστερον, πεποιήται τῷ τῶν τοιούτων. λίθων μὲν ἐργασται, σχῆμα δὲ περιφερὲς ἴσται αὐτῷ, κορυφὴ δὲ οὐκ ἐς ἀγαν οὐδ' ἀνηγμένη τὸν δὲ ἀνωτάτω τῶν λίθων φασὶν ἀρμονίαν παντὶ εἶναι τῷ οἰκοδομήματι.*"

I have no doubt that in excavating this Treasury

many objects will be found which will be as many pages of the history of the so-called heroic age. I have therefore requested the Archaeological Society to begin the excavations at once at my expense.

DR. H. SCHLIEMANN.

SCIENCE.

MEETING OF THE BRITISH ASSOCIATION AT BELFAST.—(Wednesday, August 19, 1874.)

ADDRESS of John Tyndall, F.R.S., D.C.L. Oxon., LL.D. Cantab., F.C.P.S., Professor of Natural Philosophy in the Royal Institution, President.

An impulse inherent in primeval man turned his thoughts and questionings betimes towards the sources of natural phenomena. The same impulse, inherited and intensified, is the spur of scientific action to-day. Determined by it, by a process of abstraction from experience we form physical theories which lie beyond the pale of experience, but which satisfy the desire of the mind to see every natural occurrence resting upon a cause. In forming their notions of the origin of things, our earliest historic (and doubtless, we might add, our prehistoric) ancestors pursued, as far as their intelligence permitted, the same course. They also fell back upon experience, but with this difference—that the particular experiences which furnished the web and woof of their theories were drawn, not from the study of nature, but from what lay much closer to them, the observation of men. Their theories accordingly took an anthropomorphic form. To supersensual beings, which, "however potent and invisible, were nothing but a species of human creatures, perhaps raised from among mankind, and retaining all human passions and appetites," were handed over the rule and governance of natural phenomena.

Tested by observation and reflection, these early notions failed in the long run to satisfy the more penetrating intellects of our race. Far in the depths of history we find men of exceptional power differentiating themselves from the crowd, rejecting these anthropomorphic notions, and seeking to connect natural phenomena with their physical principles. But long prior to these purer efforts of the understanding the merchant had been abroad, and rendered the philosopher possible; commerce had been developed, wealth amassed, leisure for travel and for speculation secured, while races educated under different conditions, and therefore differently informed and endowed, had been stimulated and sharpened by mutual contact. In those regions where the commercial aristocracy of ancient Greece mingled with its eastern neighbours, the sciences were born, being nurtured and developed by free-thinking and courageous men. The state of things to be displaced may be gathered from a passage of Euripides quoted by Hume. "There is nothing in the world; no glory, no prosperity. The gods toss all into confusion; mix everything with its reverse, that all of us, from our ignorance and uncertainty, may pay them the more worship and reverence." Now, as science demands the radical extirpation of caprice and the absolute reliance upon law in nature, there grew with the growth of scientific notions a desire and determination to sweep from the field of theory this mob of gods and demons, and to place natural phenomena on a basis more congruent with themselves.

The problem which had been previously approached from above, was now attacked from below; theoretic effort passed from the super- to the sub-sensible. It was felt that to construct the universe in idea it was necessary to have some notion of its constituent parts—of what Lucretius subsequently called the "First Beginnings." Abstracting again from experience, the leaders of scientific speculation reached at length the pregnant doctrine of atoms and molecules, the latest developments of which were set forth with such power and clearness at the last meeting of the

* Hume, *Natural History of Religion*.

British Association. Thought no doubt had long hovered about this doctrine before it attained the precision and completeness which it assumed in the mind of Democritus, a philosopher who may well for a moment arrest our attention. "Few great men," says Lange, in his excellent *History of Materialism*, a work to the spirit and the letter of which I am equally indebted, "have been so despitely used by history as Democritus. In the distorted images sent down to us through unscientific traditions there remains of him almost nothing but the name of the 'laughing philosopher,' while figures of immeasurably smaller significance spread themselves at full length before us." Lange speaks of Bacon's high appreciation of Democritus—for ample illustrations of which I am indebted to my excellent friend Mr. Spedding, the learned editor and biographer of Bacon. It is evident, indeed, that Bacon considered Democritus to be a man of weightier metal than either Plato or Aristotle, though their philosophy "was noised and celebrated in the schools, amid the din and pomp of professors." It was not they, but Genseric and Attila and the barbarians, who destroyed the atomic philosophy. "For at a time when all human learning had suffered shipwreck, these planks of Aristotelian and Platonic philosophy, as being of a lighter and more inflated substance, were preserved and came down to us, while things more solid sank and almost passed into oblivion."

The principles enunciated by Democritus reveal his uncompromising antagonism to those who deduced the phenomena of nature from the caprices of the gods. They are briefly these: 1. From nothing comes nothing. Nothing that exists can be destroyed. All changes are due to the combination and separation of molecules. 2. Nothing happens by chance. Every occurrence has its cause from which it follows by necessity. 3. The only existing things are the atoms and empty space; all else is mere opinion. 4. The atoms are infinite in number, and infinitely various in form; they strike together, and the lateral motions and whirlings which thus arise are the beginnings of worlds. 5. The varieties of all things depend upon the varieties of their atoms, in number, size, and aggregation. 6. The soul consists of free, smooth, round atoms, like those of fire. These are the most mobile of all. They interpenetrate the whole body, and in their motions the phenomena of life arise. Thus the atoms of Democritus are individually without sensation; they combine in obedience to mechanical laws; and not only organic forms, but the phenomena of sensation and thought are also the result of their combination.

The great enigma, "the exquisite adaptation of one part of an organism to another part, and to the conditions of life," more especially the construction of the human body, Democritus made no attempt to solve. Empedocles, a man of more fiery and poetic nature, introduced the notion of love and hate among the atoms to account for their combination and separation. Noticing this gap in the doctrine of Democritus, he struck in with the penetrating thought, linked, however, with some wild speculation, that it lay in the very nature of those combinations which were suited to their ends (in other words, in harmony with their environment) to maintain themselves, while unfit combinations, having no proper habitat, must rapidly disappear. Thus more than 2,000 years ago the doctrine of the "survival of the fittest," which in our day, not on the basis of vague conjecture, but of positive knowledge, has been raised to such extraordinary significance, had received at all events partial enunciation.*

Epicurus, said to be the son of a poor school-master at Samos, is the next dominant figure in the history of the atomic philosophy. He mastered the writings of Democritus, heard lectures in Athens, returned to Samos, and subse-

quently wandered through various countries. He finally returned to Athens, where he bought a garden, and surrounded himself by pupils, in the midst of whom he lived a pure and serene life, and died a peaceful death. His philosophy was almost identical with that of Democritus; but he never quoted either friend or foe. One main object of Epicurus was to free the world from superstition and the fear of death. Death he treated with indifference. It merely robs us of sensation. As long as we are, death is not; and when death is, we are not. Life has no more evil for him who has made up his mind that it is no evil not to live. He adored the gods, but not in the ordinary fashion. The idea of divine power, properly purified, he thought an elevating one. Still he taught, "Not he is godless who rejects the gods of the crowd, but rather he who accepts them." The gods were to him eternal and immortal beings, whose blessedness excluded every thought of care or occupation of any kind. Nature pursues her course in accordance with everlasting laws, the gods never interfering. They haunt

"The lucid interspace of world and world
Where never creeps a cloud or moves a wind,
Nor ever falls the least white star of snow,
Nor ever lowest roll of thunder moans,
Nor sound of human sorrow mounts to mar
Their sacred everlasting calm."*

Lange considers the relation of Epicurus to the gods subjective; the indication probably of an ethical requirement of his own nature. We cannot read history with open eyes, or study human nature to its depths, and fail to discern such a requirement. Man never has been, and he never will be satisfied with the operations and products of the Understanding alone; hence physical science cannot cover all the demands of his nature. But the history of the efforts made to satisfy these demands might be broadly described as a history of errors—the error consisting in ascribing fixity to that which is fluent, which varies as we vary, being gross when we are gross, and becoming, as our capacities widen, more abstract and sublime. On one great point the mind of Epicurus was at peace. He neither sought nor expected, here or hereafter, any personal profit from his relation to the gods. And it is assuredly a fact that loftiness and serenity of thought may be promoted by conceptions which involve no idea of profit of this kind. "Did I not believe," said a great man to me once, "that an Intelligence is at the heart of things, my life on earth would be intolerable." The utterer of these words is not, in my opinion, rendered less noble but more noble, by the fact that it was the need of ethical harmony here, and not the thought of personal profit hereafter, that prompted his observation.

A century and a half after the death of Epicurus, Lucretius wrote his great poem, "On the Nature of Things," in which he, a Roman, developed with extraordinary ardour the philosophy of his Greek predecessor. He wishes to win over his friend Memmius to the school of Epicurus; and although he has no rewards in a future life to offer, although his object appears to be a purely negative one, he addresses his friend with the heat of an apostle. His object, like that of his great forerunner, is the destruction of superstition; and considering that men trembled before every natural event as a direct monition from the gods, and that everlasting torture was also in prospect, the freedom aimed at by Lucretius might perhaps be deemed a positive good. "This terror," he says, "and darkness of mind must be dispelled, not by the rays of the sun and glittering shafts of days, but by the aspect and the law of nature." He refutes the notion that any thing can come out of nothing, or that that which is once begotten can be recalled to nothing. The first beginnings, the atoms, are indestructible, and into them all things can be dissolved at last. Bodies

are partly atoms, and partly combinations of atoms; but the atoms nothing can quench. They are strong in solid singleness, and by their denser combination, all things can be closely packed and exhibit enduring strength. He denies that matter is infinitely divisible. We come at length to the atoms, without which, as an imperishable substratum, all order in the generation and development of things would be destroyed.

The mechanical shock of the atoms being in his view the all-sufficient cause of things, he combats the notion that the constitution of nature has been in any way determined by intelligent design. The interaction of the atoms throughout infinite time rendered all manner of combinations possible. Of these the fit ones persisted, while the unfit ones disappeared. Not after sage deliberation did the atoms station themselves in the right places, nor did they bargain what motions they should assume. From all eternity they have been driven together, and after trying motions and unions of every kind, they fell at length into the arrangements out of which this system of things has been formed. His grand conception of the atoms falling silently through immeasurable ranges of space and time suggested the nebular hypothesis to Kant, its first propounder. "If you will apprehend and keep in mind these things, nature, free at once, and rid of her haughty lords, is seen to do all things spontaneously of herself, without the meddling of the gods."

During the centuries between the first of these three philosophers and the last, the human intellect was active in other fields than theirs. The sophists had run through their career. At Athens had appeared the three men, Socrates, Plato, and Aristotle, whose yoke remains to some extent unbroken to the present hour. Within this period also the School of Alexandria was founded, Euclid wrote his *Elements*, and he and others made some advance in optics. Archimedes had propounded the theory of the lever, and the principles of hydrostatics. Pythagoras had made his experiments on the harmonic intervals, while astronomy was immensely enriched by the discoveries of Hipparchus, who was followed by the historically more celebrated Ptolemy. Anatomy had been made the basis of Scientific medicine; and it is said by Draper* that vivisection then began. In fact, the science of ancient Greece had already cleared the world of the fantastic images of divinities operating capriciously through natural phenomena. It had shaken itself free from that fruitless scrutiny "by the internal light of the mind alone," which had vainly sought to transcend experience and reach a knowledge of ultimate causes. Instead of accidental observation, it had introduced observation with a purpose; instruments were employed to aid the senses; and scientific method was rendered in a great measure complete by the union of Induction and Experiment.

What, then, stopped its victorious advance? Why was the scientific intellect compelled, like an exhausted soil, to lie fallow for nearly two millenniums before it could regather the elements necessary to its fertility and strength? Bacon has already let us know one cause; Whewell ascribes this stationary period to four causes—obscurity of thought, servility, intolerance of disposition, enthusiasm of temper; and he gives striking examples of each.† But these characteristics must have had their causes, which lay in the circumstances of the time. Rome, and the other cities of the Empire, had fallen into moral putrefaction. Christianity had appeared, offering the gospel to the poor, and, by moderation if not asceticism of life, practically protesting against the profligacy of the age. The sufferings of the early Christians and the extraordinary exaltation of mind which enabled them to triumph over the diabolical tortures to which they were subjected, must have left traces not

* Tennyson's *Lucretius*.

easily effaced. They scorned the earth, in view of that "building of God, that house not made with hands, eternal in the heavens." The Scriptures which ministered to their spiritual needs were also the measure of their science. When, for example, the celebrated question of antipodes came to be discussed, the Bible was with many the ultimate court of appeal. Augustine, who flourished A.D. 400, would not deny the rotundity of the earth; but he would deny the possible existence of inhabitants at the other side, "because no such race is recorded in Scripture among the descendants of Adam." Archbishop Boniface was shocked at the assumption of a "world of human beings out of the reach of the means of salvation." Thus reined in, science was not likely to make much progress. Later on the political and theological strife between the Church and civil governments, so powerfully depicted by Draper, must have done much to stifle investigation.

Whewell makes many wise and brave remarks regarding the spirit of the Middle Ages. It was a menial spirit. The seekers after natural knowledge had forsaken that fountain of living waters, the direct appeal to nature by observation and experiment, and had given themselves up to the remanipulation of the notions of their predecessors. It was a time when thought had become abject, and when the acceptance of mere authority led, as it always does in science, to intellectual death. Natural events, instead of being traced to physical, were referred to moral causes; while an exercise of the phantasy, almost as degrading as the spiritualism of the present day, took the place of scientific speculation. Then came the mysticism of the Middle Ages, Magic, Alchemy, the Neo-platonic philosophy, with its visionary though sublime abstractions, which caused men to look with shame upon their own bodies as hindrances to the absorption of the creature in the blessedness of the Creator. Finally came the Scholastic philosophy, a fusion, according to Lange, of the least mature notions of Aristotle with the Christianity of the west. Intellectual immobility was the result. As a traveller without a compass in a fog may wander long, imagining he is making way, and find himself after hours of toil at his starting-point, so the schoolmen, having tied and untied the same knots and formed and dissipated the same clouds, found themselves at the end of centuries in their old position.

With regard to the influence wielded by Aristotle in the Middle Ages, and which, though to a less extent, he still wields, I would ask permission to make one remark. When the human mind has achieved greatness and given evidence of extraordinary power in any domain, there is a tendency to credit it with similar power in all other domains. Thus theologians have found comfort and assurance in the thought that Newton dealt with the question of revelation, forgetful of the fact that the very devotion of his powers, through all the best years of his life, to a totally different class of ideas, not to speak of any natural disqualification, tended to render him less instead of more competent to deal with theological and historic questions. Goethe, starting from his established greatness as a poet, and indeed from his positive discoveries in natural history, produced a profound impression among the painters of Germany when he published his *Farbenlehre*, in which he endeavoured to overthrow Newton's theory of colours. This theory he deemed so obviously absurd, that he considered its author a charlatan, and attacked him with a corresponding vehemence of language. In the domain of natural history Goethe had made really considerable discoveries; and we have high authority for assuming that, had he devoted himself wholly to that side of science, he might have reached in it an eminence comparable with that which he attained as a poet. In sharpness of observation, in the detection of analogies however

apparently remote, in the classification and organisation of facts according to the analogies discerned, Goethe possessed extraordinary powers. These elements of scientific enquiry fall in with the discipline of the poet. But, on the other hand, a mind thus richly endowed in the direction of natural history, may be almost shorn of endowment as regards the more strictly called physical and mechanical sciences. Goethe was in this condition. He could not formulate distinct mechanical conceptions; he could not see the force of mechanical reasoning; and in regions where such reasoning reigns supreme he became a mere *ignus fatuus* to those who followed him.

I have sometimes permitted myself to compare Aristotle with Goethe, to credit the Stagirite with an almost superhuman power of amassing and systematising facts, but to consider him fatally defective on that side of the mind in respect to which incompleteness has just been ascribed to Goethe. Whewell refers the errors of Aristotle, not to a neglect of facts, but to "a neglect of the idea appropriate to the facts; the idea of Mechanical cause, which is Force, and the substitution of vague or inapplicable notions, involving only relations of space or emotions of wonder." This is doubtless true; but the word "neglect" implies mere intellectual misdirection, whereas in Aristotle, as in Goethe, it was not, I believe, misdirection, but sheer natural incapacity which lay at the root of his mistakes. As a physicist, Aristotle displayed what we should consider some of the worst attributes of a modern physical investigator—indistinctness of ideas, confusion of mind, and a confident use of language, which led to the delusive notion that he had really mastered his subject, while he as yet had failed to grasp even the elements of it. He put words in the place of things, subject in the place of object. He preached induction without practising it, inverting the true order of enquiry by passing from the general to the particular, instead of from the particular to the general. He made of the universe a closed sphere, in the centre of which he fixed the earth, proving from general principles, to his own satisfaction and to that of the world for near 2,000 years, that no other universe was possible. His notions of motion were entirely unphysical. It was natural or unnatural, better or worse, calm or violent—no real mechanical conception regarding it lying at the bottom of his mind. He affirmed that a vacuum could not exist, and proved that, if it did exist, motion in it would be impossible. He determined *a priori* how many species of animals must exist, and shows on general principles why animals must have such and such parts. When an eminent contemporary philosopher, who is far removed from errors of this kind, remembers these abuses of the *a priori* method, he will be able to make allowance for the jealousy of physicists as to the acceptance of so-called *a priori* truths. Aristotle's errors of detail were grave and numerous. He affirmed that only in man we had the beating of the heart, that the left side of the body was colder than the right, that men have more teeth than women, and that there is an empty space, not at the front, but at the back of every man's head.

There is one essential quality in physical conceptions which was entirely wanting in those of Aristotle and his followers. I wish it could be expressed by a word untainted by its associations; it signifies a capability of being placed as a coherent picture before the mind. The Germans express the act of picturing by the word *vorstellen*, and the picture they call a *Vorstellung*. We have no word in English which comes nearer to our requirements than *Imagination*, and, taken with its proper limitations, the word answers very well; but, as just intimated, it is tainted by its associations, and therefore objectionable to some minds. Compare, with reference to this capacity of mental presentation, the case of the Aristotelian, who refers the ascent of water in a pump to Nature's

abhorrence of a vacuum, with that of Pascal when he proposed to solve the question of atmospheric pressure by the ascent of the Puy de Dome. In the one case the terms of the explanation refuse to fall into place as a physical image; in the other the image is distinct, the fall and rise of the barometer being clearly figured as the balancing of two varying and opposing pressures.

During the drought of the Middle Ages in Christendom, the Arabian intellect, as forcibly shown by Draper, was active. With the intrusion of the Moors into Spain, cleanliness, order, learning, and refinement took the place of their opposites. When smitten with disease, the Christian peasant resorted to a shrine, the Moorish one to an instructed physician. The Arabs encouraged translations from the Greek philosophers, but not from the Greek poets. They turned in disgust "from the lewdness of our classical mythology, and denounced as an unpardonable blasphemy all connexion between the impure Olympian Jove and the Most High God." Draper traces still further than Whewell the Arab elements in our scientific terms. He gives examples of what Arabian men of science accomplished, dwelling particularly on Alhazen, who was the first to correct the Platonic notion that rays of light are emitted by the eye. He discovered atmospheric refraction, and points out that we see the sun and moon after they have set. He explains the enlargement of the sun and moon, and the shortening of the vertical diameters of both these bodies, when near the horizon. He is aware that the atmosphere decreases in density with increase of height, and actually fixes its height at 5½ miles. In the Book of the Balance of Wisdom, he sets forth the connexion between the weight of the atmosphere and its increasing density. He shows that a body will weigh differently in a rare and a dense atmosphere: he considers the force with which plunged bodies rise through heavier media. He understands the doctrine of the centre of gravity, and applies it to the investigation of balances and steelyards. He recognises gravity as a force, though he falls into the error of making it diminish as the distance, and of making it purely terrestrial. He knows the relation between the velocities, spaces, and times of falling bodies, and has distinct ideas of capillary attraction. He improves the hydrometer. The determination of the densities of bodies as given by Alhazen approach very closely to our own. "I join," says Draper, in the pious prayer of Alhazen, "that in the day of judgment the All-Merciful will take pity on the soul of Abur-Raihan, because he was the first of the race of men to construct a table of specific gravities." If all this be historic truth (and I have entire confidence in Dr. Draper), well may he "deplore the systematic manner in which the literature of Europe has contrived to put out of sight our scientific obligations to the Mahomedans."

Towards the close of the stationary period a word-weariness, if I may so express it, took more and more possession of men's minds. Christendom had become sick of the school philosophy and its verbal wastes, which led to no issue, but left the intellect in everlasting haze. Here and there was heard the voice of one impatiently crying in the wilderness, "Not unto Aristotle, not unto subtle hypotheses, not unto church, bible, or blind tradition, must we turn for a knowledge of the universe, but to the direct investigation of nature by observation and experiment." In 1543 the epoch-making work of Copernicus on the paths of the heavenly bodies appeared. The total crash of Aristotle's closed universe with the earth at its centre followed as a consequence; and "the earth moves" became a kind of watchword among intellectual freemen. Copernicus was Canon of the church of Frauenburg in the diocese of Ermeland. For three-and-thirty years he had withdrawn himself from the world and devoted himself to the consolidation of his great scheme of the solar

system. He made its blocks eternal; and even to those who feared it and desired its overthrow it was so obviously strong that they refrained for a time from meddling with it. In the last year of the life of Copernicus his book appeared: it is said that the old man received a copy of it a few days before his death, and then departed in peace.

The Italian philosopher Giordano Bruno was one of the earliest converts to the new astronomy. Taking Lucretius as his exemplar, he revived the notion of the infinity of worlds; and combining with it the doctrine of Copernicus, reached the sublime generalisation that the fixed stars are suns, scattered numberless through space and accompanied by satellites, which bear the same relation to them that our earth does to our sun, or our moon to our earth. This was an expansion of transcendent import; but Bruno came closer than this to our present line of thought. Struck with the problem of the generation and maintenance of organisms, and duly pondering it, he came to the conclusion that Nature in her productions does not imitate the technic of man. Her process is one of unravelling and unfolding. The infinity of forms under which matter appears were not imposed upon it by an external artificer; by its own intrinsic force and virtue it brings these forms forth. Matter is not the mere naked, empty *capacity* which philosophers have pictured her to be, but the universal mother, who brings forth all things as the fruit of her own womb.

This outspoken man was originally a Dominican monk. He was accused of heresy and had to fly, seeking refuge in Geneva, Paris, England, and Germany. In 1602 he fell into the hands of the Inquisition at Venice. He was imprisoned for many years, tried, degraded, excommunicated, and handed over to the Civil power, with the request that he should be treated gently and "without the shedding of blood." This meant that he was to be burnt; and burnt accordingly he was, on February 16, 1600. To escape a similar fate Galileo, thirty-three years afterwards, abjured, upon his knees and with his hand upon the holy gospels, the heliocentric doctrine. After Galileo came Kepler, who from his German home defied the power beyond the Alps. He traced out from pre-existing observations the laws of planetary motion. The problem was thus prepared for Newton, who bound those empirical laws together by the principle of gravitation.

During the Middle Ages the doctrine of atoms had to all appearance vanished from discussion. In all probability it held its ground among sober-minded and thoughtful men, though neither the church nor the world was prepared to hear of it with tolerance. Once, in the year 1348, it received distinct expression. But retraction by compulsion immediately followed, and thus discouraged, it slumbered till the 17th century, when it was revived by a contemporary of Hobbes and Descartes, the Père Gassendi.

The analytic and synthetic tendencies of the human mind exhibit themselves throughout history, great writers ranging themselves sometimes on the one side, sometimes on the other. Men of lofty feelings, and minds open to the elevating impressions produced by nature as a whole, whose satisfaction, therefore, is rather ethical than logical, have leaned to the synthetic side; while the analytic harmonises best with the more precise and more mechanical bias which seeks the satisfaction of the understanding. Some form of pantheism was usually adopted by the one, while a detached Creator, working more or less after the manner of men, was often assumed by the other. Gassendi is hardly to be ranked with either. Having formally acknowledged God as the great first cause, he immediately drops the idea, applies the known laws of mechanics to the atoms, and thence deduces all vital phenomena. God, who created earth and water, plants and animals, produced in the first place a definite number of atoms, which constituted the seed of all things.

Then began that series of combinations and decompositions which goes on at the present day, and which will continue in the future. The principle of every change resides in matter. In artificial productions the moving principle is different from the material worked upon; but in nature the agent works within, being the most active and mobile part of the material itself. Thus this bold ecclesiastic, without incurring the censure of the church or the world, contrives to outstrip Mr. Darwin. The same cast of mind which caused him to detach the Creator from his universe led him also to detach the soul from the body, though to the body he ascribes an influence so large as to render the soul almost unnecessary. The aberrations of reason were, in his view, an affair of the material brain. Mental disease is brain-disease; but then the immortal reason sits apart, and cannot be touched by the disease. The errors of madness are errors of the instruments, not of the performer.

It may be more than a mere result of education, connecting itself probably with the deeper mental structure of the two men, that the idea of Gassendi above enunciated is substantially the same as that expressed by Professor Clerk Maxwell at the close of the very noble lecture delivered by him at Bradford last year. According to both philosophers, the atoms, if I understand aright, are the *prepared materials*, the "manufactured articles," which, formed by the skill of the Highest, produce by their subsequent interaction all the phenomena of the material world. There seems to be this difference, however, between Gassendi and Maxwell. The one *postulates*, the other *infers* his first cause. In his manufactured articles, Professor Maxwell finds the basis of an induction, which enables him to scale philosophic heights considered inaccessible by Kant, and to take the logical step from the atoms to their Maker.

The atomic doctrine, in whole or in part, was entertained by Bacon, Descartes, Hobbes, Locke, Newton, Boyle, and their successors, until the chemical law of multiple proportions enabled Dalton to confer upon it an entirely new significance. In our day there are secessions from the theory, but it still stands firm. Only a year or two ago Sir William Thomson, with characteristic penetration, sought to determine the size of the atoms, or rather to fix the limits between which their sizes lie; while only last year the discourses of Williamson and Maxwell illustrate the present hold of the doctrine upon the foremost scientific minds. What these atoms, self-moved and self-positing, can and cannot accomplish in relation to life, is at the present moment the subject of profound scientific thought. I doubt the legitimacy of Maxwell's logic; but it is impossible not to feel the ethic glow with which his lecture concludes. There is, moreover, a Lucretian grandeur in his description of the steadfastness of the atoms:—"Natural causes, as we know, are at work, which tend to modify, if they do not at length destroy, all the arrangements and dimensions of the earth and the whole solar system. But though in the course of ages catastrophes have occurred and may yet occur in the heavens, though ancient systems may be dissolved and new systems evolved out of their ruins, the molecules out of which these systems are built, the foundation stones of the material universe, remain unbroken and unworn."

Ninety years subsequent to Gassendi the doctrine of bodily instruments, as it may be called, assumed immense importance in the hands of Bishop Butler, who, in his famous *Analogy of Religion*, developed, from his own point of view, and with consummate sagacity, a similar idea. The Bishop still influences superior minds; and it will repay us to dwell for a moment on his views. He draws the sharpest distinction between our real selves and our bodily instruments. He does not, as far as I remember, use the word "soul," possibly because the term was so hackneyed in his

day, as it had been for many generations previously. But he speaks of "living powers," "perceiving" or "percipient powers," "moving agents," "ourselves," in the same sense as we should employ the term "soul." He dwells upon the fact that limbs may be removed, and mortal diseases assail the body, while the mind almost up to the moment of death remains clear. He refers to sleep and to swoon, where the "living powers" are suspended, but not destroyed. He considers it quite as easy to conceive of an existence out of our bodies as in them; that we may animate a succession of bodies, the dissolution of all of them having no more tendency to dissolve our real selves, or "deprive us of living faculties—the faculties of perception and action—than the dissolution of any foreign matter which we are capable of receiving impressions from, or making use of for the common occasions of life." This is the key of the Bishop's position: "our organised bodies are no more a part of ourselves than any other matter around us." In proof of this he calls attention to the use of glasses, which "prepare objects" for the "percipient power" exactly as the eye does. The eye itself is no more percipient than the glass, and is quite as much the instrument of the true self, and also as foreign to the true self, as the glass is. "And if we see with our eyes only in the same manner as we do with glasses, the like may justly be concluded from analogy of all our senses."

Lucretius, as you are aware, reached a precisely opposite conclusion; and it certainly would be interesting, if not profitable, to us all, to hear what he would or could urge in opposition to the reasoning of the Bishop.

After giving a hypothetical dialogue between a disciple of Lucretius and Butler, the lecturer proceeds to remark that in one respect the Bishop was a product of his age. Long previous to his day the nature of the soul had been so favourite and general a topic of discussion, that, when the students of the University of Paris wished to know the leanings of a new Professor, they at once requested him to lecture upon the soul. About the time of Bishop Butler the question was not only agitated but extended. It was seen by the clear-witted men who entered this arena that many of their best arguments applied equally to brutes and men. The Bishop's arguments were of this character. He saw it, admitted it, accepted the consequences, and boldly embraced the whole animal world in his scheme of immortality.

Bishop Butler accepted with unwavering trust the chronology of the Old Testament, describing it as "confirmed by the natural and civil history of the world, collected from common historians, from the state of the earth, and from the late inventions of arts and sciences." These words mark progress: they must seem somewhat hoary to the Bishop's successors of to-day. It is hardly necessary to inform you that since his time the domain of the naturalist has been immensely extended—the whole science of geology, with its astounding revelations regarding the life of the ancient earth, having been created. The rigidity of old conceptions has been relaxed, the public mind being rendered gradually tolerant of the idea that not for six thousand, nor for sixty thousand, nor for six thousand thousand, but for aeons embracing untold millions of years, this earth has been the theatre of life and death. The riddle of the rocks has been read by the geologist and palaeontologist, from subcambrian depths to the deposits thickening over the sea-bottoms of to-day. And upon the leaves of that stone book are, as you know, stamped the characters, plainer and surer than those formed by the ink of history, which carry the mind back into abysses of past time compared with which the periods which satisfied Bishop Butler cease to have a visual angle. Everybody now knows this: all men admit it; still when they were first broached these verities of science found loud-tongued denouncers, who proclaimed not only their

baselessness considered scientifically, but their immorality considered as questions of ethics and religion: the Book of Genesis had stated the question in a different fashion; and science must necessarily go to pieces when it clashed with this authority. And as the seed of the thistle produces a thistle, and nothing else, so these objectors scatter their germs abroad, and reproduce their kind, ready to play again the part of their intellectual progenitors, to show the same virulence, the same ignorance, to achieve for a time the same success, and finally to suffer the same inexorable defeat. Surely the time must come at last when human nature in its entirety, whose legitimate demands it is admitted science alone cannot satisfy, will find interpreters and expositors of a different stamp from those rash and ill-informed persons who have been hitherto so ready to hurl themselves against every new scientific revelation, lest it should endanger what they are pleased to consider theirs.

The lode of discovery once struck, those petrified forms in which life was at one time active, increased to multitudes and demanded classification. The general fact soon became evident that none but the simplest forms of life lie lowest down, that as we climb higher and higher among the superimposed strata more perfect forms appear. The change, however, from form to form was not continuous—but by steps, some small, some great. “A section,” says Mr. Huxley, “a hundred feet thick will exhibit at different heights a dozen species of Ammonite, none of which passes beyond its particular zone of limestone, or clay, into the zone below it, or into that above it.” In the presence of such facts it was not possible to avoid the question:—Have these forms, showing, though in broken stages and with many irregularities, this unmistakable general advance, been subjected to no continuous law of growth or variation? Had our education been purely scientific, or had it been sufficiently detached from influences which, however ennobling in another domain, have always proved hindrances and delusions when introduced as factors into the domain of physics, the scientific mind ever could have swerved from the search for a law of growth, or allowed itself to accept the anthropomorphism which regarded each successive stratum as a kind of mechanic's bench for the manufacture of new species out of all relation to the old.

Biassed, however, by their previous education, the great majority of naturalists invoked a special creative act to account for the appearance of each new group of organisms. Doubtless there were numbers who were clear-headed enough to see that this was no explanation at all, that in point of fact it was an attempt, by the introduction of a greater difficulty, to account for a less. But having nothing to offer in the way of explanation, they for the most part held their peace. Still the thoughts of reflecting men naturally and necessarily simmered round the question. De Maillet, a contemporary of Newton, has been brought into notice by Professor Huxley as one who “had a notion of the modifiability of living forms.” In my frequent conversations with him, the late Sir Benjamin Brodie, a man of highly philosophic mind, often drew my attention to the fact that, as early as 1794, Charles Darwin's grandfather was the pioneer of Charles Darwin. In 1801, and in subsequent years, the celebrated Lamarck, who produced so profound an impression on the public mind through the vigorous exposition of his views by the author of the *Vestiges of Creation*, endeavoured to show the development of species out of changes of habit and external condition. In 1813, Dr. Wells, the founder of our present theory of Dew, read before the Royal Society a paper in which, to use the words of Mr. Darwin, “he distinctly recognises the principle of natural selection; and this is the first recognition that has been indicated.” The thoroughness and skill with which Wells pursued his work, and the ob-

vious independence of his character, rendered him long ago a favourite with me; and it gave me the liveliest pleasure to alight upon this additional testimony to his penetration. Professor Grant, Mr. Patrick Matthew, Von Buch, the author of the *Vestiges*, D'Halloy, and others,* by the enunciation of views more or less clear and correct, showed that the question had been fermenting long prior to the year 1858, when Mr. Darwin and Mr. Wallace simultaneously but independently placed their closely concurrent views upon the subject before the Linnean Society.

These papers were followed in 1859 by the publication of the first edition of *The Origin of Species*. All great things come slowly to the birth. Copernicus, as I informed you, pondered his great work for thirty-three years. Newton for nearly twenty years kept the idea of Gravitation before his mind; for twenty years also he dwelt upon his discovery of Fluxions, and doubtless would have continued to make it the object of his private thought, had he not found that Leibnitz was upon his track. Darwin for two and twenty years pondered the problem of the origin of species, and doubtless he would have continued to do so had he not found Wallace upon his track.† A concentrated, but full and powerful epitome of his labours was the consequence. The book was by no means an easy one; and probably not one in every score of those who then attacked it had read its pages through, or were competent to grasp their significance if they had. I do not say this merely to discredit them; for there were in those days some really eminent scientific men, entirely raised above the heat of popular prejudice, willing to accept any conclusion that science had to offer, provided it was duly backed by fact and argument, and who entirely mistook Mr. Darwin's views. In fact the work needed an expounder; and it found one in Mr. Huxley. I know nothing more admirable in the way of scientific exposition than those early articles of his on the origin of species. He swept the curve of discussion through the really significant points of the subject, enriched his exposition with profound original remarks and reflections, often summing up in a single pithy sentence an argument which a less compact mind would have spread over pages. But there is one impression made by the book itself which no exposition of it, however luminous, can convey; and that is the impression of the vast amount of labour, both of observation and of thought, implied in its production. Let us glance at its principles.

It is conceded on all hands that what are called varieties are continually produced. The rule is probably without exception. No chick and no child is in all respects and particulars the counterpart of its brother or sister; and in such differences we have “variety” incipient. No naturalist could tell how far this variation could be carried; but the great mass of them held that never by any amount of internal or external change, nor by the mixture of both, could the offspring of the same progenitor so far deviate from each other as to constitute different species. The function of the experimental philosopher is to combine the conditions of nature and to produce her results; and this was the method of Darwin.‡ He made himself acquainted with what could, without any manner of doubt, be done in the way of producing variation. He associated himself with pigeon-fanciers—bought,

begged, kept, and observed every breed that he could obtain. Though derived from a common stock, the diversities of these pigeons were such that “a score of them might be chosen which, if shown to an ornithologist, and he were told that they were wild birds, would certainly be ranked by him as well-defined species. The simple principle which guides the pigeon-fancier, as it does the cattle-breeder, is the selection of some variety that strikes his fancy, and the propagation of this variety by inheritance. With his eye still upon the particular appearance which he wishes to exaggerate, he selects it as it reappears in successive broods, and thus adds increment to increment until an astonishing amount of divergence from the parent type is effected. Man in this case does not produce the elements of the variation. He simply observes them, and by selection adds them together until the required result has been obtained. “No man,” says Mr. Darwin, “would ever try to make a fantail till he saw a pigeon with a tail developed in some slight degree in an unusual manner, or a pouter until he saw a pigeon with a crop of unusual size.” Thus nature gives the hint, man acts upon it, and by the law of inheritance exaggerates the deviation.

Having thus satisfied himself by indubitable facts that the organisation of an animal or of a plant (for precisely the same treatment applies to plants) is to some extent plastic, he passes from variation under domestication to variation under nature. Hitherto we have dealt with the adding together of small changes by the conscious selection of man. Can Nature thus select? Mr. Darwin's answer is, “Assuredly she can.” The number of living things produced is far in excess of the number that can be supported; hence at some period or other of their lives there must be a struggle for existence; and what is the infallible result? If one organism were a perfect copy of the other in regard to strength, skill, and agility, external conditions would decide. But this is not the case. Here we have the fact of variety offering itself to nature, as in the former instance it offered itself to man; and those varieties which are least competent to cope with surrounding conditions will infallibly give way to those that are most competent. To use a familiar proverb, the weakest comes to the wall. But the triumphant fraction again breeds to overproduction, transmitting the qualities which secured its maintenance, but transmitting them in different degrees. The struggle for food again supervenes, and those to whom the favourable quality has been transmitted in excess will assuredly triumph. It is easy to see that we have here the addition of increments favourable to the individual still more rigorously carried out than in the case of domestication; for not only are unfavourable specimens not selected by nature, but they are destroyed. This is what Mr. Darwin calls “Natural Selection,” which “acts by the preservation and accumulation of small inherited modifications, each profitable to the preserved being.” With this idea he interpenetrates and leaves the vast store of facts that he and others have collected. We cannot, without shutting our eyes through fear or prejudice, fail to see that Darwin is here dealing, not with imaginary, but with true causes; nor can we fail to discern what vast modifications may be produced by natural selection in periods sufficiently long. Each individual increment may resemble what mathematicians call a “differential” (a quantity indefinitely small); but definite and great changes may be obviously produced by the integration of these infinitesimal quantities through practically infinite time.

If Darwin, like Bruno, rejects the notion of creative power acting after human fashion, it certainly is not because he is unacquainted with the numberless exquisite adaptations on which this notion of a supernatural artificer has been founded. His book is a repository of the most startling facts of this description. Take the marvellous observation which he cites from Dr. Crieger, where a bucket

* In 1855 Mr. Herbert Spencer (*Principles of Psychology*, 2nd edit. vol. i. p. 465) expressed “the belief that life under all its forms has arisen by an unbroken evolution, and through the instrumentality of what are called natural causes.”

† The behaviour of Mr. Wallace in relation to this subject has been dignified in the highest degree.

‡ The first step only towards experimental demonstration has been taken. Experiments now begun might, a couple of centuries hence, furnish data of incalculable value, which ought to be supplied to the science of the future.

with an aperture, serving as a spout, is formed in an orchid. Bees visit the flower: in eager search of material for their combs they push each other into the bucket, the drenched ones escaping from their involuntary bath by the spout. Here they rub their backs against the viscid stigma of the flower and obtain glue; then against the pollen-masses, which are thus stuck to the back of the bee and carried away. "When the bee, thus provided, flies to another flower, or to the same flower a second time, and is pushed by its comrades into the bucket, and then crawls out by the passage, the pollen-mass upon its back necessarily comes first into contact with the viscid stigma," which takes up the pollen; and this is how that orchid is fertilised. Or take this other case of the *Catasetum*. "Bees visit these flowers in order to gnaw the labellum; on doing this they inevitably touch a long, tapering, sensitive projection. This, when touched, transmits a sensation or vibration to a certain membrane, which is instantly ruptured, setting free a spring, by which the pollen-mass is shot forth like an arrow in the right direction, and adheres by its viscid extremity to the back of the bee." In this way the fertilising pollen is spread abroad.

It is the mind thus stored with the choicest materials of the teleologist that rejects teleology, seeking to refer these wonders to natural causes. They illustrate, according to him, the method of nature, not the "technic" of a man-like Artificer. The beauty of flowers is due to natural selection. Those that distinguish themselves by vividly contrasting colours from the surrounding green leaves are most readily seen, most frequently visited by insects, most often fertilised, and hence most favoured by natural selection. Coloured berries also readily attract the attention of birds and beasts, which feed upon them, spread their manured seeds abroad, thus giving trees and shrubs possessing such berries a greater chance in the struggle for existence.

With profound analytic and synthetic skill, Mr. Darwin investigates the cell-making instinct of the hive-bee. His method of dealing with it is representative. He falls back from the more perfectly to the less perfectly developed instinct—from the hive-bee to the humble bee, which uses its own cocoon as a comb, and to classes of bees of intermediate skill, endeavouring to show how the passage might be gradually made from the lowest to the highest. The saving of wax is the most important point in the economy of bees. Twelve to fifteen pounds of dry sugar are said to be needed for the secretion of a single pound of wax. The quantities of nectar necessary for the wax must therefore be vast; and every improvement of constructive instinct which results in the saving of wax is a direct profit to the insect's life. The time that would otherwise be devoted to the making of wax is now devoted to the gathering and storing of honey for winter food. He passes from the humble bee with its rude cells, through the *Melipona* with its more artistic cells, to the hive-bee with its astonishing architecture. The bees place themselves at equal distances apart upon the wax, sweep and excavate equal spheres round the selected points. The spheres intersect, and the planes of intersection are built up with thin laminae. Hexagonal cells are thus formed. This mode of treating such questions is, as I have said, representative. He habitually retires from the more perfect and complex, to the less perfect and simple, and carries you with him through stages of *perfecting*, adds increment to increment of infinitesimal change, and in this way gradually breaks down your reluctance to admit that the exquisite climax of the whole could be a result of natural selection.

Mr. Darwin shirks no difficulty; and, saturated as the subject was with his own thought, he must have known, better than his critics, the weakness as well as the strength of his theory. This of course would be of little avail were his object a temporary dialectic victory instead of the estab-

lishment of a truth which he means to be everlasting. But he takes no pains to disguise the weakness he has discerned; nay, he takes every pains to bring it into the strongest light. His vast resources enable him to cope with objections started by himself and others, so as to leave the final impression upon the reader's mind that, if they be not completely answered, they certainly are not fatal. Their negative force being thus destroyed, you are free to be influenced by the vast positive mass of evidence he is able to bring before you. This largeness of knowledge and readiness of resource render Mr. Darwin the most terrible of antagonists. Accomplished naturalists have levelled heavy and sustained criticisms against him—not always with the view of fairly weighing his theory, but with the express intention of exposing its weak points only. This does not irritate him. He treats every objection with a soberness and thoroughness which even Bishop Butler might be proud to imitate, surrounding each fact with its appropriate detail, placing it in its proper relations, and usually giving it a significance which, as long as it was kept isolated, failed to appear. This is done without a trace of ill-temper. He moves over the subject with the passionless strength of a glacier; and the grinding of the rocks is not always without a counterpart in the logical pulverisation of the objector. But though in handling this mighty theme all passion has been stilled, there is an emotion of the intellect incident to the discernment of new truth which often colours and warms the pages of Mr. Darwin. His success has been great; and this implies not only the solidity of his work, but the preparedness of the public mind for such a revelation. On this head a remark of Agassiz impressed me more than any thing else. Sprung from a race of theologians, this celebrated man combated to the last the theory of natural selection. One of the many times I had the pleasure of meeting him in the United States was at Mr. Winthrop's beautiful residence at Brookline, near Boston. Rising from luncheon we all halted as if by a common impulse in front of a window, and continued there a discussion which had been started at table. The maple was in its autumn glory; and the exquisite beauty of the scene outside seemed, in my case, to interpenetrate without disturbance the intellectual action. Earnestly, almost sadly, Agassiz turned, and said to the gentlemen standing round, "I confess that I was not prepared to see this theory received as it has been by the best intellects of our time. Its success is greater than I could have thought possible."

In our day great generalisations have been reached. The theory of the origin of species is but one of them. Another, of still wider grasp and more radical significance, is the doctrine of the Conservation of Energy, the ultimate philosophical issues of which are as yet but dimly seen—that doctrine which "binds nature fast in fate" to an extent not hitherto recognised, exacting from every antecedent its equivalent consequent, from every consequent its equivalent antecedent, and bringing vital as well as physical phenomena under the dominion of that law of causal connexion which, as far as the human understanding has yet pierced, asserts itself everywhere in nature. Long in advance of all definite experiment upon the subject, the constancy and indestructibility of matter had been affirmed; and all subsequent experience justified the affirmation. Later researches extended the attribute of indestructibility to force. This idea, applied in the first instance to inorganic, rapidly embraced organic nature. The vegetable world, though drawing almost all its nutriment from invisible sources, was proved incompetent to generate anew either matter or force. Its matter is for the most part transmuted air; its force transformed solar force. The animal world was proved to be equally uncreative, all its motive energies being referred to the combustion of its food. The activity of each animal as a whole was proved to be the transferred

activities of its molecules. The muscles were shown to be stores of mechanical force, potential until unlocked by the nerves, and then resulting in muscular contractions. The speed at which messages fly to and fro along the nerves was determined, and found to be, not as had been previously supposed, equal to that of light or electricity, but less than the speed of a flying eagle.

This was the work of the physicist: then came the conquests of the comparative anatomist and physiologist, revealing the structure of every animal, and the function of every organ in the whole biological series, from the lowest zoophyte up to man. The nervous system had been made the object of profound and continued study, the wonderful and, at bottom, entirely mysterious, controlling power which it exercises over the whole organism, physical and mental, being recognised more and more. Thought could not be kept back from a subject so profoundly suggestive. Besides the physical life dealt with by Mr. Darwin, there is a psychical life presenting similar gradations, and asking equally for a solution. How are the different grades and orders of Mind to be accounted for? What is the principle of growth of that mysterious power which on our planet culminates in Reason? These are questions which, though not thrusting themselves so forcibly upon the attention of the general public, had not only occupied many reflecting minds, but had been formally broached by one of them before the *Origin of Species* appeared.

With the mass of materials furnished by the physicist and physiologist in his hands, Mr. Herbert Spencer, twenty years ago, sought to graft upon this basis a system of psychology; and two years ago a second and greatly amplified edition of his work appeared. Those who have occupied themselves with the beautiful experiments of Plateau will remember that when two spherules of olive-oil suspended in a mixture of alcohol and water of the same density as the oil, are brought together, they do not immediately unite. Something like a pellicle appears to be formed around the drops, the rupture of which is immediately followed by the coalescence of the globules into one. There are organisms whose vital actions are almost as purely physical as that of these drops of oil. They come into contact and fuse themselves thus together. From such organisms to others a stage higher, and from these to others a shade higher still, and on through an ever ascending series, Mr. Spencer conducts his argument. There are two obvious factors to be here taken into account—the creature and the medium in which it lives, or, as it is often expressed, the organism and its environment. Mr. Spencer's fundamental principle is, that between these two factors there is incessant interaction. The organism is played upon by the environment, and is modified to meet the requirements of the environment. Life he defines to be "a continuous adjustment of internal relations to external relations."

In the lowest organisms we have a kind of tactual sense diffused over the entire body; then, through impressions from without and their corresponding adjustments, special portions of the surface become more responsive to stimuli than others. The senses are nascent, the basis of all of them being that simple tactual sense which the sage Democritus recognised 2,300 years ago as their common progenitor. The action of light, in the first instance, appears to be a mere disturbance of the chemical processes in the animal organism, similar to that which occurs in the leaves of plants. By degrees the action becomes localised in a few pigment-cells, more sensitive to light than the surrounding tissue. The eye is here incipient. At first it is merely capable of revealing differences of light and shade produced by bodies close at hand. Followed as the interception of the light is in almost all cases by the contact of the closely adjacent opaque body, sight in this condition becomes a kind of "anticipatory touch."

The adjustment continues; a slight bulging out of the epidermis over the pigment-granules supervenes. A lens is incipient, and, through the operation of infinite adjustments, at length reaches the perfection that it displays in the hawk and eagle. So of the other senses; they are special differentiations of a tissue which was originally vaguely sensitive all over.

With the development of the senses the adjustments between the organism and its environment gradually extend in *space*, a multiplication of experiences and a corresponding modification of conduct being the result. The adjustments also extend in *time*, covering continually greater intervals. Along with this extension in space and time the adjustments also increase in speciality and complexity, passing through the various grades of brute life, and prolonging themselves into the domain of reason. Very striking are Mr. Spencer's remarks regarding the influence of the sense of touch upon the development of intelligence. This is, so to say, the mother-tongue of all the senses, into which they must be translated to be of service to the organism. Hence its importance. The parrot is the most intelligent of birds, and its tactual power is also greatest. From this sense it gets knowledge unattainable by birds which cannot employ their feet as hands. The elephant is the most sagacious of quadrupeds—its tactual range and skill, and the consequent multiplication of experiences, which it owes to its wonderfully adaptable trunk, being the basis of its sagacity. Feline animals, for a similar cause, are more sagacious than hoofed animals,—atonement being to some extent made, in the case of the horse, by the possession of sensitive prehensile lips. In the *Primates* the evolution of intellect and the evolution of tactual appendages go hand in hand. In the most intelligent anthropoid apes we find the tactual range and delicacy greatly augmented, new avenues of knowledge being thus opened to the animal. Man crowns the edifice here, not only in virtue of his own manipulatory power, but through the enormous extension of his range of experience, by the invention of instruments of precision, which serve as supplemental senses and supplemental limbs. The reciprocal action of these is finely described and illustrated. That chastened intellectual emotion to which I have referred in connexion with Mr. Darwin is, I should say, not absent in Mr. Spencer. His illustrations possess at times exceeding vividness and force; and from his style on such occasions it is to be inferred that the ganglia of this Apostle of the Understanding are sometimes the seat of a nascent poetic thrill.

It is a fact of supreme importance that actions the performance of which at first requires even painful effort and deliberation, may by habit be rendered automatic. Witness the slow learning of its letters by a child, and the subsequent facility of reading in a man, when each group of letters which forms a word is instantly, and without effort, fused to a single perception. Instance the billiard-player, whose muscles of hand and eye, when he reaches the perfection of his art, are unconsciously co-ordinated. Instance the musician, who, by practice, is enabled to fuse a multitude of arrangements, auditory, tactual and muscular, into a process of automatic manipulation. Combining such facts with the doctrine of hereditary transmission, we reach a theory of instinct. A chick, after coming out of the egg, balances itself correctly, runs about, picks up food, thus showing that it possesses a power of directing its movements to definite ends. How did the chick learn this very complex co-ordination of eye, muscles, and beak? It has not been individually taught; its personal experience is *nil*; but it has the benefit of ancestral experience. In its inherited organisation are registered all the powers which it displays at birth. So also as regards the instinct of the hive-bee, already referred to. The distance at which the insects stand apart when they sweep their hemispheres and build their cells is "organically remembered." Man also

carries with him the physical texture of his ancestry, as well as the inherited intellect bound up with it. The defects of intelligence during infancy and youth are probably less due to a lack of individual experience than to the fact that in early life the cerebral organisation is still incomplete. The period necessary for completion varies with the race, and with the individual. As a round shot outstrips a rifled one on quitting the muzzle of the gun, so the lower race in childhood may outstrip the higher. But the higher eventually overtakes the lower, and surpasses it in range. As regards individuals, we do not always find the precocity of youth prolonged to mental power in maturity; while the dullness of boyhood is sometimes strikingly contrasted with the intellectual energy of after years. Newton, when a boy, was weakly, and he showed no particular aptitude at school; but in his eighteenth year he went to Cambridge, and soon afterwards astonished his teachers by his power of dealing with geometrical problems. During his quiet youth his brain was slowly preparing itself to be the organ of those energies which he subsequently displayed.

By myriad blows (to use a Lucretian phrase) the image and superscription of the external world are stamped as states of consciousness upon the organism, the depth of the impression depending upon the number of the blows. When two or more phenomena occur in the environment invariably together, they are stamped to the same depth or to the same relief, and indissolubly connected. And here we come to the threshold of a great question. Seeing that he could in no way rid himself of the consciousness of Space and Time, Kant assumed them to be necessary "forms of thought," the moulds and shapes into which our intuitions are thrown, belonging to ourselves solely and without objective existence. With unexpected power and success Mr. Spencer brings the hereditary experience theory, as he holds it, to bear upon this question. "If there exist certain external relations which are experienced by all organisms at all instants of their waking lives—relations which are absolutely constant and universal—there will be established answering internal relations that are absolutely constant and universal. Such relations we have in those of Space and Time. As the substratum of all other relations of the Non-Ego, they must be responded to by conceptions that are the substrata of all other relations in the Ego. Being the constant and infinitely repeated elements of thought, they must become the automatic elements of thought—the elements of thought which it is impossible to get rid of—the 'forms of intuition.'"

Throughout this application and extension of the "Law of Inseparable Association," Mr. Spencer stands on totally different ground from Mr. John Stuart Mill, invoking the registered experiences of the race instead of the experiences of the individual. His overthrow of Mr. Mill's restriction of experience is, I think, complete. That restriction ignores the power of organising experience furnished at the outset to each individual; it ignores the different degrees of this power possessed by different races and by different individuals of the same race. Were there not in the human brain a potency antecedent to all experience, a dog or cat ought to be as capable of education as a man. These predetermined internal relations are independent of the experiences of the individual. The human brain is the "organised register of infinitely numerous experiences received during the evolution of life, or rather during the evolution of that series of organisms through which the human organism has been reached. The effects of the most uniform and frequent of these experiences have been successively bequeathed, principal and interest, and have slowly mounted to that high intelligence which lies latent in the brain of the infant. Thus it happens that the European inherits from twenty to thirty cubic inches more of

brain than the Papuan. Thus it happens that faculties, as of music, which scarcely exist in some inferior races, become congenital in superior ones. Thus it happens that out of savages unable to count up to the number of their fingers, and speaking a language containing only nouns and verbs, arise at length our Newtons and Shakespeares."

At the outset of this Address it was stated that physical theories which lie beyond experience are derived by a process of abstraction from experience. It is instructive to note from this point of view the successive introduction of new conceptions. The idea of the attraction of gravitation was preceded by the observation of the attraction of iron by a magnet, and of light bodies by rubbed amber. The polarity of magnetism and electricity appealed to the senses; and thus became the substratum of the conception that atoms and molecules are endowed with definite, attractive, and repellent poles, by the play of which definite forms of crystalline architecture are produced. Thus molecular force becomes structural. It required no great boldness of thought to extend its play into organic nature, and to recognise in molecular force the agency by which both plants and animals are built up. In this way out of experience arise conceptions which are wholly ultra-experiential.

The *origination* of life is a point lightly touched upon, if at all, by Mr. Darwin and Mr. Spencer. Diminishing gradually the number of progenitors, Mr. Darwin comes at length to one "primordial form;" but he does not say, as far as I remember, how he supposes this form to have been introduced. He quotes with satisfaction the words of a celebrated author and divine who had "gradually learnt to see that it is just as noble a conception of the Deity to believe He created a few original forms, capable of self-development into other and needful forms, as to believe that He required a fresh act of creation to supply the voids caused by the action of His laws." What Mr. Darwin thinks of this view of the introduction of life I do not know. Whether he does or does not introduce his "primordial form" by a creative act, I do not know. But the question will inevitably be asked, "How came the form there?" With regard to the diminution of the number of created forms, one does not see that much advantage is gained by it. The anthropomorphism, which it seemed the object of Mr. Darwin to set aside, is as firmly associated with the creation of a few forms as with the creation of a multitude. We need clearness and thoroughness here. Two courses and two only are possible. Either let us open our doors freely to the conception of creative acts, or abandoning them let us radically change our notions of Matter. If we look at matter as pictured by Democritus, and as defined for generations in our scientific text-books, the absolute impossibility of any form of life coming out of it would be sufficient to render any other hypothesis preferable; but the definitions of matter given in our text-books were intended to cover its purely physical and mechanical properties. And taught as we have been to regard these definitions as complete, we naturally and rightly reject the monstrous notion that out of *such* matter any form of life could possibly arise. But are the definitions complete? Everything depends on the answer to be given to this question. Trace the line of life backwards, and see it approaching more and more to what we call the purely physical condition. We reach at length those organisms which I have compared to drops of oil suspended in a mixture of alcohol and water. We reach the *protogenes* of Haeckel, in which we have "a type distinguishable from a fragment of albumen only by its finely granular character." Can we pause here? We break a magnet and find two poles in each of its fragments. We continue the process of breaking, but, however small the parts, each carries with it, though enfeebled, the polarity of the whole. And when we can break no longer, we prolong the intellectual vision to the polar

molecules. Are we not urged to do *something* similar in the case of life? Is there not a temptation to close to some extent with Lucretius, when he affirms that "Nature is seen to do all things spontaneously of herself without the meddling of the gods"? or with Bruno, when he declares that Matter is not "that mere empty *capacity* which philosophers have pictured her to be, but the universal mother who brings forth all things as the fruit of her own womb"? The questions here raised are inevitable. They are approaching us with accelerated speed, and it is not a matter of indifference whether they are introduced with reverence or with irreverence. Abandoning all disguise, the confession that I feel bound to make before you is that I prolong the vision backwards across the boundary of the experimental evidence, and discern in that Matter, which we in our ignorance, and notwithstanding our professed reverence for its Creator, have hitherto covered with opprobrium, the promise and potency of every form and quality of Life.

The "materialism" here enunciated may be different from what you suppose, and I therefore crave your gracious patience to the end. "The question of an external world," says Mr. J. S. Mill, "is the great battle-ground of metaphysics."* Mr. Mill himself reduces external phenomena to "possibilities of sensation." Kant, as we have seen, made time and space "forms" of our own intuitions. Fichte, having first by the inexorable logic of his understanding proved himself to be a mere link in that chain of eternal causation which holds so rigidly in nature, violently broke the chain by making nature, and "all that it inherit," an apparition of his own mind.† And it is by no means easy to combat such notions. For when I say I see you, and that I have not the least doubt about it, the reply is that what I am really conscious of is an affection of my own retina. And if I urge that I can check my sight of you by touching you, the retort would be that I am equally transgressing the limits of fact: for what I am really conscious of is, not that you are there, but that the nerves of my hand have undergone a change. All we hear, and see, and touch, and taste, and smell are, it would be urged, mere variations of our own condition, beyond which, even to the extent of a hair's breadth, we cannot go. That anything answering to our impressions exists outside of ourselves is not a *fact*, but an *inference*, to which all validity would be denied by an idealist like Berkeley, or by a sceptic like Hume. Mr. Spencer takes another line. With him, as with the uneducated man, there is no doubt or question as to the existence of an external world. But he differs from the uneducated, who think that the world really *is* what consciousness represents it to be. Our states of consciousness are mere *symbols* of an outside entity which produces them and determines the order of their succession, but the real nature of which we can never know. In fact the whole process of evolution is the manifestation of a Power absolutely inscrutable to the intellect of man. As little in our day as in the days of Job can man by searching find this Power out. Considered fundamentally, it is by the operation of an insoluble mystery that life is evolved, species differentiated, and mind unfolded from their prepotent elements in the immeasurable past. There is, you will observe, no very rank materialism here.

The strength of the doctrine of evolution consists, not in an experimental demonstration (for the subject is hardly accessible to this mode of proof), but in its general harmony with the method of nature as hitherto known. From contrast, moreover, it derives enormous relative strength. On the one side we have a theory (if it could with any propriety be so called) derived, as were the theories referred to at the beginning of this Address, not from the study of nature, but from the observation of men—a theory

which converts the Power whose garment is seen in the visible universe into an Artificer, fashioned after the human model, and acting by broken efforts as man is seen to act. On the other side we have the conception that all we see around us, and all we feel within us—the phenomena of physical nature as well as those of the human mind—have their unsearchable roots in a cosmical life, if I dare apply the term, an infinitesimal span of which only is offered to the investigation of man. And even this span is only knowable in part. We can trace the development of a nervous system, and correlate with it the parallel phenomena of sensation and thought. We see with undoubting certainty that they go hand in hand. But we try to soar in a vacuum the moment we seek to comprehend the connexion between them. An Archimedean fulcrum is here required which the human mind cannot command; and the effort to solve the problem, to borrow an illustration from an illustrious friend of mine, is like the effort of a man trying to lift himself by his own waistband. All that has been here said is to be taken in connexion with this fundamental truth. When "nascent senses" are spoken of, when "the differentiation of a tissue, at first vaguely sensitive all over," is spoken of, and when these processes are associated with "the modification of an organism by its environment," the same parallelism, without contact, or even approach to contact, is implied. There is no fusion possible between the two classes of facts—no motor energy in the intellect of man to carry it without logical rupture from the one to the other.

Further, the doctrine of evolution derives man, in his totality, from the interaction of organism and environment through countless ages past. The Human Understanding, for example—that faculty which Mr. Spencer has turned so skillfully round upon its own antecedents—is itself a result of the play between organism and environment through cosmic ranges of time. Never surely did prescription plead so irresistible a claim. But then it comes to pass that, over and above his understanding, there are many other things appertaining to man whose prescriptive rights are quite as strong as that of the understanding itself. It is a result, for example, of the play of organism and environment that sugar is sweet and that aloes are bitter, that the smell of henbane differs from the perfume of a rose. Such facts of consciousness (for which, by the way, no adequate reason has ever yet been rendered) are quite as old as the understanding itself; and many other things can boast an equally ancient origin. Mr. Spencer at one place refers to that most powerful of passions—the amatory passion—as one which, when it first occurs, is antecedent to all relative experience whatever; and we may pass its claim as being at least as ancient and as valid as that of the understanding itself. Then there are such things woven into the texture of man as the feeling of Awe, Reverence, Wonder—and not alone the sexual love just referred to, but the love of the beautiful, physical and moral, in Nature, Poetry, and Art. There is also that deep-set feeling which, since the earliest dawn of history, and probably for ages prior to all history, incorporated itself in the Religions of the world. You who have escaped from these religions into the high-and-dry light of the understanding may deride them; but in so doing you deride accidents of form merely, and fail to touch the immovable basis of the religious sentiment in the emotional nature of man. To yield this sentiment reasonable satisfaction is the problem of problems at the present hour. And grotesque in relation to scientific culture as many of the religions of the world have been and are—dangerous, nay, destructive, to the dearest privileges of freemen as some of them undoubtedly have been, and would, if they could, be again—it will be wise to recognise them as the forms of a force, mischievous, if permitted to intrude on the region of *knowledge*,

over which it holds no command, but capable of being guided by liberal thought to noble issues in the region of *emotion*, which is its proper sphere. It is vain to oppose this force with a view to its extirpation. What we should oppose, to the death if necessary, is every attempt to found upon this elemental bias of man's nature a system which should exercise despotic sway over his intellect. I do not fear any such consummation. Science has already to some extent leavened the world, and it will leaven it more and more. I should look upon the mild light of science breaking in upon the minds of the youth of Ireland, and strengthening gradually to the perfect day, as a surer check to any intellectual or spiritual tyranny which might threaten this island, than the laws of princes or the swords of emperors. Where is the cause of fear? We fought and won our battle even in the Middle Ages: why should we doubt the issue of a conflict now?

The impregnable position of science may be described in a few words. All religious theories, schemes, and systems, which embrace notions of cosmogony, or which otherwise reach into its domain, must, in so far as they do this, submit to the control of science, and relinquish all thought of controlling it. Acting otherwise proved disastrous in the past, and it is simply fatuous to-day. Every system which would escape the fate of an organism too rigid to adjust itself to its environment, must be plastic to the extent that the growth of knowledge demands. When this truth has been thoroughly taken in, rigidity will be relaxed, exclusiveness diminished, things now deemed essential will be dropped, and elements now rejected will be assimilated. The lifting of the life is the essential point; and as long as dogmatism, fanaticism, and intolerance are kept out, various modes of leverage may be employed to raise life to a higher level. Science itself not unfrequently derives motive power from an ultra-scientific source. Whewell speaks of enthusiasm of temper as a hindrance to science; but he means the enthusiasm of weak heads. There is a strong and resolute enthusiasm in which science finds an ally; and it is to the lowering of this fire, rather than to a diminution of intellectual insight, that the lessening productiveness of men of science in their mature years is to be ascribed. Mr. Buckle sought to detach intellectual achievement from moral force. He gravely erred; for without moral force to whip it into action, the achievements of the intellect would be poor indeed.

It has been said that science divorces itself from literature: the statement, like so many others, arises from lack of knowledge. A glance at the less technical writings of its leaders—of its Helmholtz, its Huxley, and its Du Bois-Reymond—would show what breadth of literary culture they command. Where among modern writers can you find their superiors in clearness and vigour of literary style? Science desires not isolation, but freely combines with every effort towards the bettering of man's estate. Single-handed, and supported not by outward sympathy, but by inward force, it has built at least one great wing of the many-mansioned home which man in his totality demands. And if rough walls and protruding rafters indicate that on one side the edifice is incomplete, it is only by wise combination of the parts required with those already irrevocably built that we can hope for completeness. There is no necessary incongruity between what has been accomplished and what remains to be done. The moral glow of Socrates, which we all feel by ignition, has in it nothing incompatible with the physics of Anaxagoras which he so much scorned, but which he would hardly scorn to-day. And here I am reminded of one amongst us, hoary, but still strong, whose prophet-voice some thirty years ago, far more than any other of this age, unlocked whatever of life and nobleness lay latent in its most gifted minds—one fit to stand beside Socrates or the Maccabean, Eleazar, and to dare and suffer all

* *Examination of Hamilton*, p. 154.

† *Bestimmung des Menschen*.

that they suffered and dared—fit, as he once said of Fichte, “to have been the teacher of the Stoa, and to have discoursed of beauty and virtue in the groves of Academe.” With a capacity to grasp physical principles which his friend Goethe did not possess, and which even total lack of exercise has not been able to reduce to atrophy, it is the world's loss that he, in the vigour of his years, did not open his mind and sympathies to science, and make its conclusions a portion of his message to mankind. Marvellously endowed as he was—equally equipped on the side of the Heart and of the Understanding—he might have done much towards teaching us how to reconcile the claims of both, and to enable them in coming times to dwell together in unity of spirit and in the bond of peace.

And now the end is come. With more time, or greater strength and knowledge, what has been here said might have been better said, while worthy matters here omitted might have received fit expression. But there would have been no material deviation from the views set forth. As regards myself, they are not the growth of a day; and as regards you, I thought you ought to know the environment which, with or without your consent, is rapidly surrounding you, and in relation to which some adjustment on your part may be necessary. A hint of Hamlet's, however, teaches us all how the troubles of common life may be ended; and it is perfectly possible for you and me to purchase intellectual peace at the price of intellectual death. The world is not without refuges of this description; nor is it wanting in persons who seek their shelter and try to persuade others to do the same. I would exhort you to refuse such shelter, and to scorn such base repose—to accept, if the choice be forced upon you, commotion before stagnation, the leap of the torrent before the stillness of the swamp. In the one there is at all events life and, therefore, hope; in the other none. I have touched on debateable questions, and led you over dangerous ground—and this partly with the view of telling you, and through you the world, that as regards these questions science claims unrestricted right of search. It is not to the point to say that the views of Lucretius and Bruno, of Darwin and Spencer, may be wrong. I concede the possibility, deeming it indeed certain that these views will undergo modification. But the point is, that, whether right or wrong, we claim the freedom to discuss them. The ground which they cover is scientific ground; and the right claimed is one made good through tribulation and anguish, inflicted and endured in darker times than ours, but resulting in the immortal victories which science has won for the human race. I would set forth equally the inexorable advance of man's understanding in the path of knowledge, and the unquenchable claims of his emotional nature which the understanding can never satisfy. The world embraces not only a Newton, but a Shakspeare—not only a Boyle, but a Raphael—not only a Kant, but a Beethoven—not only a Darwin, but a Carlyle. Not in each of these, but in all, is human nature whole. They are not opposed, but supplementary—not mutually exclusive, but reconcilable. And if, still unsatisfied, the human mind, with the yearning of a pilgrim for his distant home, will turn to the mystery from which it has emerged, seeking so to fashion it as to give unity to thought and faith—so long as this is done, not only without intolerance or bigotry of any kind, but with the enlightened recognition that ultimate fixity of conception is here unattainable, and that each succeeding age must be held free to fashion the mystery in accordance with its own needs—then, in opposition to all the restrictions of Materialism, I would affirm this to be a field for the noblest exercise of what, in contrast with the *knowing* faculties, may be called the *creative* faculties of man. Here, however, I must quit a theme too great for me to handle, but which will be handled by the loftiest minds ages after you and I, like

streaks of morning cloud, shall have melted into the infinite azure of the past.

GEOLOGICAL SECTION.

ADDRESS of the President, Professor Edward Hull, M.A., F.R.S., F.G.S.

Professor Hull commenced his address to the Geological Section (C) by a tribute to the services rendered to Geology by the late Professor Phillips; and then proceeded to discuss the volcanic phenomena of co. Antrim and the adjoining districts. His object was to present a connected history of the operations carried on by terrestrial agents in the island, from the commencement of the volcanic era to its close.

This era, though short as compared with the sum of geologic time, was in reality vastly extended, and comprised within its limits several stages or divisions characterised by special physical conditions. Speaking in geological terms, it probably included the latter part of the Eocene and the whole of the Miocene periods, interrupted by long pauses in the outburst of volcanic products.

But before entering upon the narrative of events which occupied this space of time, we should first endeavour to determine the physical limits of the theatre of these operations; for it may well be asked, considering the great extent to which the volcanic products have been cleared from off the surface of the country by denudation, with what degree of precision can we define the original limits of the volcanic area?

Let us for a moment, when replying to this question, turn to a more recent volcanic district for an illustration. When we ascend the cone of Vesuvius, and from that commanding station sweep with our eyes the surrounding region, we find ourselves in the centre of a plain—the Campagna of Naples—formed of the products of volcanic eruptions, but limited through three quarters of a circle by calcareous hills of older date, and along the other portion by the sea.

The original limits of the volcanic district of the north-east of Ireland may be laid down, and from some elevated stations rising from the central plateau of Antrim these limits may be almost described by the uprising of ridges of more ancient rocks in several directions. Taking our stand on Tardree Hill, or Sleamish, we see to the southward the granitic and schistose ridge of Slieve Croob, projected against a background of the mountains of Mourne, culminating in Slieve Donard. Westward the eye rests on the rugged masses of Slieve Gullion and the Silurian hills of Newtown Hamilton. Towards the north, after passing the depression of the southern shore of Lough Neagh and the valley of the river Blackwater, the enclosing ridge of old rocks, forming from this distance an apparently unbroken line, ranges northward into Donegal and the northern shores of Lough Foyle. The ocean now intervenes; but a comparison of the physical characters of the Donegal mountains with those of Islay, Jura, Cantyre, and the Western Highlands leaves the impression on my mind that the volcanic region of Antrim was limited northwards along the line of a submarine ridge, and that there is little reason for supposing that the volcanic rocks of Mull were superficially connected with those of this country,—on the contrary, the probability seems to be that the old crystalline rocks of the Western Highlands were interposed between the two regions.

Turning to the eastward, the sea overflows an area at one time occupied by volcanic products, but now only partially so, and we are unable strictly to define their easterly limits; but it is tolerably certain that the sheets of lava did not reach the shores of Galloway or those of the Isle of Man. Basaltic dykes, however, as is well known, traverse the north of England and the south of Scotland; but if referable, as Professor Geikie concludes, to the Miocene period, they

cannot be included in the volcanic region as here described and understood.

Thus the volcanic plateau of Antrim, like the Campagna of Naples, is washed on one side by the sea, and its limits become indefinable in consequence; but to the south, the west, and to some extent to the north, the limits of the region are marked out by mountains of considerable elevation. Within this region craters poured forth lavas or other volcanic products, which extended in great sheets until they were intercepted by the uprising of these natural barriers.

The floor of the area thus partially circumscribed was formed of various materials, as the accidents of denudation admitted. Over the central portions it was chiefly Cretaceous limestone (or Chalk), but to the southward it was New Red Sandstone and Lower Silurian, and to the north, Chalk, Lias, Carboniferous, and Lower Silurian beds in different directions. The whole region composed of rocks thus distributed was probably converted into dry land towards the close of the Eocene period—when, at various points, highly silicated felspathic lavas burst forth, consolidating into sheets of trachyte porphyry, rhyolite, and more rarely pitchstone, such as are found at Brown Dod Hill and Tardree near Antrim, and west of Hillsborough. These trachytic lavas were therefore the oldest of the volcanic eruptions of the north of Ireland, and seem to have been represented by the newer granitoid rocks recently described by Zirkel, Geikie, and Judd in the Island of Mull on the one hand, and by the trachytes of Mont Dore in Central France on the other. They have been described in this district by Berger and Bryce; but it is only recently that their relations to the other lavas have been clearly determined. In composition, both at Hillsborough and at Antrim, they present a felspathic base, enclosing crystals of sanidine (or glassy feldspar) and grains of quartz. At Brown Dod Hill they are disposed in sheets, showing lines of viscous flow and dipping beneath the overlying beds of basalt.

The outpouring of these trachytic lavas may, with every probability, be referred back to the later Eocene period. At any rate, a considerable interval probably elapsed before the eruption of the next series of lavas of Miocene age, which are essentially augitic, and may be comprehended under the heads of basalt and dolerite with their amygdaloidal varieties. Sheets of these lavas were formed, from various vents, over the uneven surface of the older rocks, and to a far greater extent, both as to area and thickness, than in the case of the preceding eruptions of trachyte. These beds, which are often vesicular, attain in some places a thickness of 600 feet, and are surmounted by decomposed lava and volcanic ashes, which mark the close of the second period of eruption.

The sheets of augitic lava which were poured forth during this stage are remarkable for their vesicular character and the numerous thin bands of red ochre (bole or laterite) which separate the different lava-flows, and which have been recognised by Sir C. Lyell as probably ancient soils formed by the decomposition of the beds of lava, similar to those in Madeira and the Canary Islands, resulting from streams of sub-aerial origin. Microscopic examination bears out this view; for a thin slice of one of the more compact beds of bole from the north coast showed that the felspar-prisms retained their form, while the augite and magnetite ingredients had passed into the state of an ochreous paste.

The vesicular and amygdaloidal character of these older beds of lava shows the probability that they have been poured forth under no greater pressure than that of the atmosphere, and, together with the evidence derived from the bands of ochre, leads to the conclusion that they have been erupted over land-surfaces. Some of the vents of eruption are now visible, either in the form of amorphous masses of trap protruded through the sheets, or of great funnels filled by bombs, broken

pieces of rock, and ashes, such as the rock on which is perched the venerable ruin of Dunluce Castle (the ancient stronghold of the MacDonnells), or the neck erupted through the Chalk in the coast-cliffs near Portrush. One of these old funnels was found by the late Mr. Du Noyer near this place: it forms a portion of the crest of the ridge overlooking Belfast Lough, to the east of Cave Hill.

The period of the formation of the older sheets appears to have been brought to a close by the discharge of volcanic ashes and the formation of an extensive lake, or series of lakes, over the region extending at least from the shores of Belfast Lough to the northern coast of Antrim, in which the remarkable beds of pisolitic iron ore were ultimately deposited. That water was present, and that the beds of ash which underlie the pisolitic ore were stratified, at least in some instances, is abundantly evident upon an examination of the sections at Ballypalidy, Ballymena, and the northern coast. In some places they are seen to be perfectly laminated in a manner that could only take place by the agency of water. It would seem, therefore, that by the combination of slight terrestrial movements a shallow basin was formed over the area indicated, which received the streams charged with iron in solution, draining the upland margins, from the waters of which was precipitated the iron, possibly by the agency of confervoid algae, or by the escape of carbonic acid, owing to which the iron became oxidised, and was precipitated.

Upon these uplands grew the plants whose remains occur amongst the ash-beds of Ballypalidy, the Causeway, and elsewhere, and which have enabled Mr. Baily to refer the strata in which they occur to the Miocene period. In some places the vegetation crept over the surface of the former lake-bottom as it became shallower or was drying up, and gave rise to beds of lignite similar to those described by the Duke of Argyll as occurring at intervals amongst the basalts of Mull. The beds of ore, wherever they are found, belong to one and the same geological horizon, and enable us to separate the basaltic series into two great divisions—one below and the other above the position of the pisolitic ore; and which, on maps of the Geological Survey, will for the future be represented by two different shades of colouring.

The ore itself is now laid open in numerous adits driven into the hill-sides, or in open works at Island Magee, Shane's Hill, Broughshane, Red Bay, Portfad, and other places, whence it is transported to the furnaces of Scotland, Cumberland, Lancashire, and Wales. A new source of industry and wealth is rapidly springing up over the already prosperous county of Antrim, and ere many years are over we may expect to see furnaces established at several points for smelting the ores at the mines from which they are extracted.

The period of volcanic inaction just described was brought to a close by fresh eruptions of augitic lavas, which spread in massive sheets over the beds of ore, bole, and even lignite, without materially altering their constitution. Thus on the north coast a band of lignite is interposed between the pisolitic ore below and a massive bed of columnar basalt above, which can be followed and identified by the size and regularity of its columns for several square miles over the district. That this molten rock has not utterly reduced the lignite to ashes, or even entirely obliterated the impressions of the plant-remains, has been doubtless due to the rapidity with which a hard crust, of low conducting-power, consolidates on the outside of a lava stream, as has been frequently observed on Vesuvius and other active volcanoes.

Above this peculiarly massive bed were piled fresh sheets of basalt and dolerite to a total depth of at least 400 feet, each flow of lava being consolidated in a somewhat different manner from those above and below it, and probably separated

from them by considerable intervals of time, as bands of ochre intervene in most instances between successive beds indicating subaerial soils of decomposed lava.

The maximum thickness of the basaltic sheets of Antrim has been estimated by Mr. Duffin and myself at 1,100 feet, to which must be added perhaps 200 feet for the subordinate trachytic beds, giving a total of 1,300 feet for the whole volcanic series. This is rather more than originally assigned by Dr. Berger, who places it at 900 feet, but it falls far short of the enormous accumulations of Mull, estimated by Professor Geikie at from 3,000 to 4,000 feet; in neither district, however, have we the data for determining the original thickness of volcanic *ejecta*, as in both large masses of material have been wasted away by denudation, and not a single volcanic cone or crater remains behind out of all those which, probably in numbers corresponding to those of Central France, were planted over the entire volcanic region.

The basaltic dykes which traverse not only the geological formations subordinate to the bedded traps, but also the latter themselves are, in some districts, both remarkable and exceedingly numerous. To the south of Belfast Lough we find at Scrabo Hill an outlying mass of bedded dolerite resting on New Red Sandstone, and far beyond the limits of the main masses which rise in a fine escarpment to the north of the Lough. There is every probability that Scrabo Hill is the site of a distinct focus of eruption; but it is also remarkable for the dykes of trap, as well as intrusive sheets, which have been squeezed in between the beds of sandstone themselves. Admirable and instructive sections are laid open in the freestone-quarries of this hill, which will amply repay a visit. Another district remarkable for such intrusions is that of Ballycastle, where dykes and sheets are seen traversing the Carboniferous rocks, as described by Sir R. Griffith in his admirable Report on the geology of that coal-field; while the well-known Giant's Causeway is itself a tessellated pavement of columnar basalt, traversing in the form of a dyke the horizontal sheets of older formation.

The intrusion of the thousands of dykes of the north-east of Ireland is unaccompanied by crumplings or contortions of the strata; and if it were possible to place the dykes side by side, their aggregate breadth would cover a space several thousand feet in breadth. How, then, has this additional space amongst strata of given horizontal dimensions been obtained? Has it been by lateral tension outwards owing to inflation by means of elastic gases or vapours, or by a general bulging of the surface consequent on lateral pressure? The former view is stated by physicists to be untenable; the latter is one which will probably prove more consonant with modern views of terrestrial dynamics.

The results of the microscopic examination of a considerable number of specimens of augitic lavas from various parts of the volcanic district are of a generally uniform character. Whether we take specimens from the largely crystalline granular dolerites of Portrush or Fair Head, or the very dense micro-crystalline basalts of Shane's Castle, the structure and composition is found to be nearly uniform.

The lava is, with very few exceptions, an amorphous or subcrystalline paste of augite, enclosing long prisms or plates of labradorite feldspar, crystalline grains of titanite-ferrite, and often of olivine. Chlorite is also sometimes present as a "secondary" mineral. It will be observed that this diagnosis differs essentially from that assigned by Dr. Zirkel as the normal structure of basalt, in which the base is "a glass," and the other minerals (the augite, feldspar, and olivine) are individually crystallised out. This, indeed, is the case with the Carboniferous melaphyres of the south of Ireland, and probably with all the rocks in which augite is deficient; but the basalts of Antrim contain augite so largely in excess of the feldspar that

it has, in nearly every case, formed the base of the rock.

The basalt itself is often so rich in iron as to become an impure iron-ore. This is owing to the presence of the metal in the form of minute grains of titaniferous iron-ore, which is the principal cause of the black appearance of the rock, and also as one of the components of the augite.

From the above general review of the volcanic history of Tertiary times in the north of Ireland it will be evident that it presents us with three distinct periods, similar to those which Mr. Judd had recognised in the succession of events in the Island of Mull:—

The earliest, possibly extending as far back as the later Eocene period, characterised by the trachytic lavas.

The middle, referable to the Miocene period, characterised by vesicular augitic lavas, tufts, and plant-beds.

The latest, referable to a still later stage of the Miocene period, characterised by more solid sheets of basalt and numerous vertical dykes.

These three stages were probably separated from each other by long intervals of repose and the cessation of volcanic action. The succeeding Pliocene period seems to have been characterised by considerable terrestrial movements, resulting in the production of fractures in the earth's crust, and in the formation of that large depression which was filled with waters having a greater area than the Lough Neagh of the present day. Some of the faults which traverse the upper sheets of basalt, and are therefore of later date, have vertical dislocation amounting to 500 or 600 feet, as, for instance, that which runs along the valley under Shane's Hill near Larne. Such great fractures must necessarily have been accompanied by denudation, and it is probable that many of the present physical features had their origin at this (Pliocene) period. The extent to which the original plateau of volcanic rocks has been broken up and carried away within such comparatively recent times is vaster than is generally supposed. As there is evidence that the sheets of lava to the north of Belfast Lough were originally connected with those of Scrabo Hill to the south, we must suppose that this arm of the sea and the valley of the Lagan have been excavated since the Miocene period; while on the north-west the high elevation to which the escarpment of the basalt reaches, leads to the supposition that the basaltic sheets spread over the ground now occupied by Lough Foyle. Both along the west and along the eastern seaboard the sheets of lava are abruptly truncated and must have extended far beyond their present bounds; while many deep valleys, such as those of Glenarm, Cushendall, and Red Bay, have been excavated.

But the most remarkable result of the denudation, as bearing upon the subject before us, is the complete obliteration of the volcanic cones which we may well suppose studded the plateau. Some of these cones, at least, were contemporaneous with those now standing upon the granitic plateau of Central France, and which are but little altered in elevation since the fires which once burst forth from them became extinct. But since then the north of Ireland has been subjected to vicissitudes from which Central France has been exempted. The surface of the country has been overspread by the great ice-sheet of the earliest stage of the Glacial period, which appears to have stretched across from the Argyllshire Highlands, if we are to judge by the direction of the glacial *striae* at Fair Head.

At a later stage the country was submerged beneath the waters of the Interglacial sea which deposited the sands and gravels which overlie the Lower Boulder-clay; and subsequent emergences during the stage of the Upper Boulder-clay, together with atmospheric agencies constantly at work, whenever land has been exposed, have moulded the surface into the form we now behold.

It will thus be seen that the physical geologist,

whether a Vulcanist or a Neptunist, has in this region abundant materials on which to concentrate his attention.

Volcanic Energy.—In connection with this subject, the views of Mr. Robert Mallet may be cursorily referred to. Stated in a few words, volcanic energy, according to Mr. Mallet, has its origin primarily in the contraction of the earth's crust, due to secular cooling and the tendency of the interior molten matter to fall inwards and thus leave the exterior solid shell unsupported. The lateral pressure arising therefrom (which, as Mr. Mallet shows, is vastly greater than the vertical weight of the crust) is expended in crushing portions of the solid crust together, along lines of fracture which are supposed to correspond to those of the volcanic cones which are distributed over the earth's surface. Each successive crush produces an earthquake shock, and is converted into heat sufficient to melt the rocks which line the walls of the fissure or lie beneath at high temperatures, and which, in presence of elastic steam and gases, are erupted at intervals both of time and place.

In the words of the author of these views:—"The secular cooling of the globe is always going on, though in a very slowly descending ratio. Contraction is therefore constantly providing a store of energy to be expended in crushing parts of the crust, and through that providing for the volcanic heat. But the crushing itself does not take place with uniformity; it necessarily acts *per saltum* after accumulated pressure has reached the necessary amount at a given point, where some of the unequally pressed mass gives way, and is succeeded perhaps by a time of repose or by the transfer of the crushing action elsewhere to some weaker point."

It cannot be denied that Mr. Mallet's theory seems to be consistent with many observed facts connected with volcanic action. It has for its foundation an incontestable physical hypothesis, the secular cooling of the earth, and it seems to throw considerable light upon several observed phenomena of volcanic action—such as the distribution of cones and craters along great lines, the intermittent character of eruptions, and the connexion of earthquake shocks with volcanic outbursts. There are some statements in Mr. Mallet's paper which few physical geologists will be inclined to accept, such as the non-existence of true volcanoes before the Secondary or Mesozoic period. This statement, however, does not necessarily invalidate the general views of the author; and the lecturer held that the publication of Mr. Mallet's paper has enabled us to take a very long stride in the direction of a true theory of volcanic energy.

FINE ART.

THE PICTURE BY PIERO DELLA FRANCESCA.

THE picture by Piero della Francesca, lately added to our national collection, presents so many phases of interest that it may not be amiss to put our readers in possession of some authentic details respecting its history, and past and present condition. Furthermore, it becomes our duty to demonstrate the groundlessness of certain animadversions, marked rather by intemperance than good taste, which have been made upon this picture and its purchase for the nation.

This picture was an heirloom in the family, Marini-Franceschi, of Borgo San Sepolcro in Umbria, descendants of the painter; and had adorned the private chapel of a villa belonging to them, called La Montagna, in the neighbourhood of that town. Thence, many years ago, it was removed by the family to the town itself; and subsequently transferred to Florence to the care of Signor Frescobaldi, whose property it ultimately became. Its existence was first made known to the world at large in 1848, by the annotator of the Le Monnier edition of *Vasari*,

who, in enumerating some works by Piero, then as yet appertaining to his descendants, mentions this panel in the following terms:—

"Una tavola dove, con invenzione nuova, e con molto grazia di disegno, è rappresentata la Nascita del Redentore festeggiata dagli Angeli. La bellezza di questo dipinto fa maggiormente lamentare la perdita di freschezza o di trasparenza che ha patito il colore. Questa tavola si custodisce in Firenze presso il Sig. Cav. Frescobaldi." (*Vasari*, Ed. Le Monnier, vol. iv., p. 13, note.)

We may here remark that the picture bore, and still bears, evidence of having been left unfinished; and a family tradition connects this fact with the story told by Vasari, that the painter became blind comparatively early in life. This tradition must, however, be taken at its worth, and may be no more than a mythical explanation of the fact. Vasari's account of Piero's blindness is unsupported by any further evidence known.

In 1861, and while still in Signor Frescobaldi's hands, the picture was seen by the late Sir Charles Eastlake, then Director of the National Gallery, and so captivated him by its originality and innate beauty that he determined and agreed to purchase it, for himself at least, but in all probability with the ultimate intention of laying it before the Trustees of the National Gallery, should its condition bear the test of practical examination. At all events, this course would have been in accordance with the frequent practice of Sir Charles; a practice by which, in cases requiring immediate decision, but where either equivocal authenticity or doubtful condition could not be immediately submitted to proof, he sought to reconcile his intense love of art with the most high-minded and delicate sense of the duties of his office, and the interests of the Gallery. Whatever his intentions in this instance may have been, he believed he had secured the picture; and leaving it in Signor Frescobaldi's hands, went on a short excursion from Florence, but returned to find that it had in the interval been sold to Mr. Barker, and was already on its way to England. There is not the least reason to suppose that either Signor Frescobaldi or Mr. Barker acted unbecomingly in the case. The former may have misunderstood the first bargain, the latter may have been altogether ignorant of it. Fortunately for the interests of truth, Sir Charles, according to his custom, made a note of the condition of the picture when he saw it, which is preserved amongst his travelling notes, and we are enabled to present our readers with this memorandum, the dry statistical nature of which makes it all the more valuable as a record of facts. It is as follows:—

"Marini-Franceschi (descendants of Pietro della Francesca)—wood—split three times vertically and warped, about 4 ft. square, height about 4 ft. 2 in., width 4 ft. The Madonna kneeling, adoring the child on ground. The child not too small, and well drawn. Right, Joseph seated, with legs crossed, so as to show sole of one foot supported on left knee. He is seated on the saddle of the ass. Above Joseph are two figures (shepherds) standing. Left, five angels, standing, singing, and playing on guitars. Landscape left and right. Ruined cottage wall with roof on. Bird on it in centre. The landscape spotted (with ?) foliage blackened. The ox between the angels and the figures on right. The ass behind, braying in concert with the angels' song. Both animals well drawn. Either Pietro della Francesca or Fra Carnovale. The execution generally thinner than Pietro. The hair of one of the angels like corkscrews, like an early or young artist. Other parts finely drawn. Pen outline seen. The face of the Madonna longer than Pietro, and his peculiar mouth only to be traced in the shepherds."

The memorandum concludes with the quotation from the note in *Vasari* given above, and is dated "Florence, 1861." It will be observed that the writer makes no allusion to any serious damage beyond the splitting and warping of the panels—says nothing of a state of utter defacement which had destroyed the aesthetic beauty of the picture, or made any part of the composition, or even the

minute details, unintelligible. He describes the work indeed, with the exception of the splits and warp, as any one might describe it in its present state. Injured it was beyond doubt—but not very seriously, nor, to his experienced eye, "irretrievably." The warped and disunited panels might be rectified and reclosed; and when the surface should be cleansed of long-accumulating dirt, the picture would probably turn out to have suffered in no material point. But to anticipate this result required insight and knowledge, such as Sir Charles united with his deep appreciation of art. We have, moreover, reason to know that Sir Charles spoke of the picture with enthusiastic admiration, and never ceased to regret its having been lost to him.

Taken altogether, his estimate of it, the fact that he endeavoured to acquire it, whether for himself or the Gallery, and his valuable note, furnish evidence as to its condition at that time, differing essentially from the description elsewhere set before the public, in which it is represented as "The merest wreck and shadow of a picture—a thing of the past, ruined beyond all redemption," and again as

"Covered with successive coats of crude linseed oil, or perhaps even of olive oil. By these means in course of time a dense black or dark-brown crust was formed all over the battered surface, rendering the details all but invisible, and the panel was split up in more than one place from top to bottom. Wide fissures had opened in it, some of which had from time to time been rudely stopped up and painted over. Portions of the picture, again, when they became more than usually begrimed, had been coarsely cleaned, and all but scrubbed out by unskilful hands, the surface blistered, indented, abraded, and scratched—great patches had entirely sealed off, and heads and hands, draperies, &c., in some places had almost entirely perished. In short, no amount of legitimate restoration could have brought the picture to anything approaching its pristine aspect."

Without comment of ours, every candid mind will estimate the worth and appreciate the spirit of this minute description, volunteered as it confessedly is fifteen years after its author had seen the picture. We can only say it indicates the possession of a remarkably tenacious memory.

The public has further been informed that "it has long been a matter of notoriety" that the picture was sent by Mr. Barker for restoration in the first instance to a certain Signor Ugobaldi, in Florence, "who spent many weeks, if not months, of labour upon it." We believe we are perfectly safe in saying that no picture-restorer of that name either is, or was then known at Florence. And we know for a certainty that when Mr. Barker purchased the picture only a week or two after Sir Charles Eastlake had seen it, he caused it to be instantly packed up by Tanagli, and forwarded to London. There was therefore no time for either months or weeks of restoration upon it. For this fact, and many other details relating to this occasion, we have the word of the person who was with Mr. Barker when the purchase was effected, and who acted very much as his agent in the affair. He had known the picture for years, and his description of it as it then was, tallies precisely with that of Sir Charles Eastlake, save that he expressly says it was in "excellent condition," and that it was "as its author had left it, save that the panels had become separated, perhaps from having been originally badly mortised, and that the surface was dirty." He further mentions that part of the group to the right (Joseph and the shepherds) was unfinished. On being unpacked in London, the separated panels were placed in the hands of Mr. Morrill, in order that they might be straightened, joined, and the whole firmly parquetté at the back—processes which necessarily preceded any attempts at cleaning or restoration. Thus it will be seen from the foregoing, that the assertion or assumption as to the work having been restored at Florence falls to the ground.

So much for the history of this picture up to the period in 1862, when it was entrusted to Messrs. Bentley & Sons to be cleaned and restored.

The public has been led or left to suppose that the fact of Messrs. Bentley having repaired the surface injuries of the picture was either unknown to the authorities of the National Gallery previous to the sale, or, being known, was kept a profound secret. Such is not the case. Long before the picture came to the sale-room it had been, of course, carefully examined, and the extent of the restoration made by Messrs. Bentley fully ascertained. As to the repairs and restorations really made, these are so clearly stamped upon the picture that they may be distinguished even by a not very experienced eye. We have said that the four vertical panels had been disunited, causing three separations in the entire. Of course, even the most skilfully effected closure would still leave a mark as of a crack where the junction had taken place. Part of the process of repairing would therefore consist in stopping up the crack, and should its edges have escaped fraying, that operation might be performed so neatly as to leave no more than a fine thread-like white line, level with the general surface, in place of the dark one caused by the fissure. This white line would then have to be tinted to match the varying tones of colour in its neighbourhood; by which the eye-sore would be removed, and the real integrity of the picture left unimpaired. In the case of the picture now under consideration, these restorations have been very frankly made, and are perfectly visible. No attempt has been made to conceal them further than was needed to prevent their striking the eye as patches. Happily the injuries which the surface had otherwise undergone were almost exclusively confined to parts of the composition outside the range of the figures. The upper portion of the sky, near the edges of the picture, had suffered most, several bits having scaled off here and there. The same had taken place at the foot of the picture, chiefly on the right hand side, where the brown tint of the ground had been much abraded. Two or three small bits had likewise scaled off from the blue robe of the Madonna; otherwise the figures had escaped damage to a remarkable extent. The head of St. Joseph has, however, been very needlessly stippled over. It is stated by a gentleman at Florence, to whom we have above referred, to have been originally only *sketched in* (accennata), by the master himself. The figures of the shepherds, too, appear to have been scarcely more than outlined on the brown preparation: and although but little has been done to "help" them, yet even that little had been better left undone. With almost these exceptions the picture remains intact to a surprising extent, especially considering its antiquity, and the trying conditions to which it must have been long exposed. The ancient surface will be found to predominate all through, and the restorations to be limited almost entirely (with the single exception of the head of Joseph) to the less important parts of the picture as a whole, and to the less essential portion of the groups. A comparison of this remarkable work with the well-preserved "Enthroned Madonna with Angels," in the possession of Mr. Alfred Seymour, shows many interesting points of resemblance between both pictures. In the heads of the angels in both, we find the same type, and very much the same method of handling to prevail. We see the same rather small eyes—the rounded face—the somewhat thick nose—peculiarities also traceable in the "Baptism" of our National Gallery. The treatment of the hair is also very similar in the two former works, and the angels in all three wear their tunics kilted up by a second belt, like men girded for travel, so that the feet and ankles are fully seen. This is highly characteristic of Piero, who loved the mustering of many feet in his compositions. It enabled him to give to his figures that just balance and firm stand which invests

them with a peculiar charm. It can scarcely be doubted that Signorelli inherited the same idiosyncrasy from his master, Piero. The jewelled neckbands of the angels, and the embroidered hems of their garments are all but identical in Mr. Seymour's picture and in ours.

Nothing can be more beautiful than the conception of this "Presepio," unlike any other known to us in the serried band of angels which forms its most striking feature. Wingless, as if appointed guardians of man upon earth, they seem to have travelled over the distant mountain tops, and along the winding road that leads to the lonely manger, to exult in the long-expected moment, and render homage to the infant Redeemer of the world. The rude shepherds stand by, awed and respectful. Joseph, a grave, patriarchal figure, finely conceived, sits there in patient trustfulness. The kneeling Mary, in calm prayer—not astonished, but absorbed in the one great thought that the promise is fulfilled—forgets all earthly cares, and sees not her lowly and sad surroundings. The unaffected and manly naturalism of the whole has its counterpart only in some of the finer Athenian reliefs. The instinct of composition, transcending all that schools can teach, is here triumphant. None but a master may dare such simplicity.

We think we have here adduced ample proof to satisfy any unprejudiced judgment: 1st. That this picture never could have been at any period in a state of hopeless ruin, nor even *apparently* in a condition which could have justified an assertion to that effect; 2ndly. That it was most certainly neither cleaned nor in any way repaired before it reached England; and 3rdly. That the restorations made upon it in this country are very limited in extent, are chiefly confined to the less important and less interesting parts of the picture, and that the present surface of the greater part of it is *boni fide* the work of the master.

EDITOR.

COMPETITIONS FOR THE PRIX DE ROME.

Paris: Aug. 10, 1874.

THE rooms of the Ecole des Beaux-Arts have been filled during the past week with successive exhibitions to compete for the prizes offered by the Academy of Rome. Formerly the successful works were included in the same exhibition as those sent from Rome by the students of the Villa Medici. But as the exhibition of the latter had already been open to the public a few weeks ago, the authorities thought that they might abandon a custom which gave an opportunity to critics of making comparisons between the relative merits of the different studies in painting, sculpture, architecture, and engraving. It is impossible to understand the system now pursued by the Administration of the Ecole des Beaux-Arts. At times it seems more liberal than any that have preceded it, as, for instance, when it gave our artists the means of becoming pretty nearly independent by setting up for themselves a vast association, under the name of "The National Academy of French Artists." Sometimes it makes friends with the Institute—practically giving up the direction of modern art to that body by the mode of electing the jury for the annual exhibition called the Salon. At other times it encourages the public to find their way to the Ecole by allowing the official apartments of the establishment to be used for private exhibitions, such as those of the works of Prud'hon and Chintreuil. And then again it seems to distrust the judgment of the very same public by refusing the opportunity for those general discussions on the principles of art which recur annually in the public press,—and which in no way threaten the safety of the Ecole.

The studies of line-engraving were so indifferent that the jury did not venture on awarding the grand prize. They gave instead two second

prizes, which do not carry with them the privilege of residence in Rome. This seems to have been an act of courtesy towards the teachers of these feeble pupils—MM. Henrique and Dupont. In like manner one sees religions with their altars deserted, although the priests continue to instruct disciples and to receive homage. It is long before public opinion succeeds in overthrowing these conventionalities. These phantoms, illuminated by past triumphs and good deeds, vanish slowly under the influence of poverty, neglect and indifference. But there comes a moment when nothing can resist the force of new ideas. Line-engraving did not long survive the school of the eighteenth century. The burin, after having exhausted all that science, grace, and feeling could do in rendering the works of Watteau, Boucher, Chardin, Greuze, Teniers and Joseph Vernet, in white, black and grey, grew cold in the hand of the German Wille, and presently pedantic in that of Desnoyers. In our day it has to struggle against the increasing inroads of photography and the fashion of etching. It is dying without much present glory and without having been of much real utility in art. It was doing no good to anything except what Academicians call high art (*peinture de style*).

The existence of this style of painting (I mean as it is taught in our Academy) is itself in great danger. In vain do the doctors meet together and propose remedies and publish codes which they call grammars of the art of painting. In vain are comforting and restoring potions administered under the form of official compliments in public, of articles in orthodox reviews, of orders for pictures, of new prizes—such as that prize of the Salon which, although refused by the jury, was awarded by the minister—of medals and crosses. In vain are all who refuse to bow down before this old tragedy queen treated as noxious charlatans. The patient grows weaker and more tremulous every day. A young painter—Régnauld—who was killed at the last sortie of the besieged in Paris under the wall of the park of Buzenval, struck her a terrible blow. He was a student of the Ecole des Beaux-Arts, a circumstance as natural as it was creditable. But no sooner had he reached Rome than he felt burning within him the fire of genius, and he did not attempt to hide it. In his letters, which were published by Charpentier after his decease, he tells us how cold and dead Rome appeared to him, how heavy and pedantic her school of art. It was a purely personal opinion; but at any rate, it had the merit of truth and originality. Although so independent in his opinions, Régnauld had a great respect for the old masters and a real love of nature. At that time the students of the Villa Medici were not forced to spend more than the first year in Rome: at the end of that time they might choose any country they liked for the remainder of their term of three years. Régnauld fixed upon Spain. First Velasquez and then Goya afforded him those subjects of reflection which other minds gather from Raphael or Michael Angelo. The Alhambra intoxicated him as much as the Vatican inspires others. Morocco was his Campagna. He died very early, and neither the beauties nor the faults displayed in his works, which as yet could be considered only as full of promise, should be exaggerated. But he undoubtedly had emancipated himself from the dogmatism of the Academy, and thus obtained room for originality. It is impossible to say whether he could have established a school of his own—whether he was endowed by nature for a part which requires qualities of a rare kind, such as distinguished David or Eugène Delacroix. Still his name may be used as a brilliant argument against those Academicians who assume as a motto for their haughty manifestoes "No salvation out of the School."

Unfortunately for the Academy he manifested symptoms of insubordination as a colourist. Colour, that subtle and all-absorbing impression,

accords ill with an education received in the dim light of a studio, with a common-place model under restrictions which banish all freedom of arrangement, costume, movement, or passion. We no longer possess the austerity of the treatment of Ingres, nor have we in exchange the liberty imperatively demanded by a young, fresh, first-hand manifestation. An original pupil is only a rebel. Thus the exhibitions lose all their interest.

This last was extremely feeble. We can predict nothing of the future career of a student starting for Rome, except that he will return in four years to swell the ranks of the respectable but mediocre phalanx of artists on whom the State has bestowed a fatal gift by morally binding them by an engagement which it is materially impossible to keep. The whole revenue of the Academy will soon be insufficient to support the men who come back full of illusions and self-conceit, who, at thirty-five years of age, have not yet been exposed to the struggles of life, and who, by devoting themselves to high art, are excluded from the art proper to their own time and country.

I have somewhat exaggerated the dark shades in my picture. The Roman school in the present day is a powerful association of moral and material interests. Its members—both painters and musicians—support one another, and arrange a sort of royal road to lucrative appointments, and especially to the chairs of the Institute. The sculptors are more modest, and lead more solitary and studious lives. The engravers go for nothing, and get on as well as they can. The architects are the providence of the Academy. They stow its abortive talents in quiet but snug places such as those of superintendents of public works. When they obtain important commissions for civil or religious edifices they invariably have recourse to the pencil or chisel of their old fellow students. The new Opera House built by M. Garnier has proved how binding must be the oath administered in this society which seems to have taken for its secret motto "Help thyself, and the School will help thee." All the old members have received the best pieces, the staircases, the ceilings, the fireplaces, &c. Other painters and sculptors have been pitilessly sent away, or have obtained only some crumbs from the copious banquet of which the administration has the disposal. This instance proves architecture to be the corner stone of art.

The subject set for the students was a College of theology, law and science. The designs were remarkable. The art of washes is much cultivated, that is, of putting in neatly the broad tints which indicate the differences of ground or construction, and of the decorations, ornaments, statues, frescoes, &c. In this way are formed students capable of representing on paper the ambitions and vague ideas of those ministers or students who are desirous of leaving in one of our public buildings some trace of their tenure of power. As to the material conditions of execution, the practical convenience of the offices, the cost, the choice of materials afforded by the soil—all these conditions under which alone a perfect edifice can spring from the bowels of the earth and the brain of man—these considerations are too prosaic and vulgar for young geniuses who are going off to Rome to study the restoration of ruins.

There is a gap in the subjects taught by the Academy—the annual composition of a tragedy in accordance with the law of the three unities.

In these halls, however, into which so little of the atmosphere of the present day is admitted—which are more jealous of their privileges than the Pope of his temporal power, which are hostile to all reform, and, yet, since the death of Ingres have been without a guide or a creed—there has appeared this year a work full of freshness and originality.

This phenomenon exhibited itself in the sculp-

ture section. Still more surprising and extraordinary is the fact that a work of so much simplicity and imagination should actually have obtained the first prize, and that it was awarded unanimously.

The students in sculpture had received as a subject "The Grief of Orpheus." As usual, ten of them entered themselves for the prize. Some represented Orpheus tearing his hair out by handfuls; others, Orpheus suffering severely from colic; others, again, a tipsy Orpheus, looking as if he had just returned drunk from some dancing hall. In short, without pausing to describe designs which in general were carefully executed, there were two students who far surpassed the rest—M. Guilbert and M. Injalbert.

M. Guilbert is an excellent pupil—the type of a model pupil. He recollected that a sculptor much esteemed by his masters—M. Perraud—once upon a time personified the exhaustion which follows a great crisis by the figure of a man seated with a bent back, extended legs, drooping head, hands clasped over the knees, and hair covering the forehead. He remembered all this too well, and it is thus that he has represented his Orpheus. It had no other distinctive sign than a lyre raised from the ground and resting between the legs. It would have been an appropriate figure for a musician who has just failed in a competition of playing on the lyre. He has cast his instrument on the ground, remembering with rage the false notes awakened by his touch; still hearing the echo of the derisive shouts which follow his defeat, and swearing never to play a single note again.

But Orpheus is much more than this. He is a touching figure—conqueror of the infernal powers as an artist, and conquered in turn by the recklessness of love, as a husband. He has descended into the shades, he has passed through ranks of horrible monsters, he has heard the threefold bark of Cerberus and the cries of the angry, jealous, and terrified dead. He has seen Eurydice again. He has tuned his lyre before the throne of the implacable divinities, and drawn from its chords sounds so full of feeling, passion, grief, and eloquence, that the gods have broken their oath and given back to him the being who was the soul of his music and the eloquence of his words. He sets off on his return; soon he will reach the light once more: but the darkness is horrible to him in his state of nervous tension. The silence terrifies him. Is it indeed true that Eurydice is following? Perhaps the gods have deceived him. He turns and sees her shade rapidly fading away into nothingness.

It is an exquisitely tender story. M. Injalbert has fixed the moments following the catastrophe with extraordinary felicity. Orpheus, a slender and manly figure, suitable to the character of a young husband, is standing with his back against a tree. The wind from the mouth of the cavern swells and blows back the skirt of his short cloak. His left arm hangs down and supports mechanically the lyre which will be always dear to him. His head is slightly bent, and his contracted lips seem to quiver with the sob which precedes an outburst of tears. His right arm is stretched out as if he hoped to clasp once more the vain shadow which has disappeared into eternal darkness.

The execution of this statue is delicate and flowing. The head was broken on the day before the exhibition, and M. Injalbert was obliged to restore it in a hurry. It is wanting, therefore, in clearness, but it is sketched with a boldness which gives a complete idea of its effect when finished. There is a languor in the expression which renders admirably the idea of a highly impressionable imagination, shaken by a sharp blow to the very centre; but there is nothing effeminate about it. It reminds one of a dove which has lost its mate. One day a friend of mine shot a gull in a river before my eyes. The male bird came, and for nearly a quarter of an hour stroked the floating body of his mate with his wings. We were much touched by the sight, and the other day meeting by a

strange chance in front of the Orpheus of M. Injalbert, we exchanged a look of intelligence.

The extension of the right arm has been criticised not as a defect in composition, but because of the fragility of such a projection. But this criticism cannot be maintained in consideration of the true feeling indicated by this gesture which so evidently invokes the absent figure of Eurydice. It is a touch of invention rarely found in sculpture which cannot command the charm of colour or the effect of light.

The sentiment of this figure belongs to the Romantic School; the modelling, the delicacy of the joints and the style class it with our great school of sculpture established in the eighteenth century. This school has always preserved its superiority. It constantly renewed its youth in the study of nature. It never made to fashion, to the Academy, or to local authorities, any of those shameful concessions which dishonour art and discredit artists. It has never rejected those masters of their art who, like Rude or David of Angers have drawn their inspiration not only from ancient history or worn-out mythology, but from the history and philosophy of their own time. We hope that M. Injalbert possesses strength of mind equal to his talents, and courage sufficient to carry out the promise of his Orpheus. We trust that he will come back from Rome the same man as he now is—a French artist.

M. Injalbert has been a pupil in the atelier of M. Dumont. He was born at Béziers, in the department of L'Hérault. He was a great favourite with his companions, who loudly applauded his triumph. The inhabitants of his department have opened a subscription to give him a medal and the municipal council of his native town heads the list with a donation of 500 francs.

PH. BURTY.

The following is an exact list of the prizemen: May we welcome the names of these young men at next year's Salon—the real field of battle.

Engraving: No grand prize; first prize, M. Boisson; second prize, M. Deblais.

Architecture: Grand prize, M. Loviot; first second-grand prize, M. Pamart; third second-grand prize, M. Paulin. A good exhibition.

Painting: The subject taken from Plutarch, the *Death of the Tyrant Timophanes* seemed very revolutionary, considering the reactionary opinions declared against all allusions to liberty. Grand prize: M. Albert Besnard, pupil of M. Cabanel, he is only 25 years old and has competed for the first time. He received a medal at the last exhibition for a bold decorative painting—*Autumn*—and for the portrait of a young girl, who was no other than Mlle. de Rochefort. First second-grand prize, M. Cornere. M. E. Dantan, who also received a medal at the "Salon" for a *Monk cutting a Figure of Christ in Wood*, was honourably mentioned.

Sculpture: M. J. A. Injalbert; First second-grand prize, M. Guilbert; second second-grand prize, M. Marie. Most of the works exhibited were remarkable, those of the successful competitors excellent.

THE EXCAVATIONS AT OLYMPIA.

THE success of the Bulgarian Ministry during the late elections in Greece will, we hope, put an end to all uncertainty with regard to the ratification of a treaty concluded last April between the Greek and German Governments, relative to the excavations at Olympia. It is but natural that the Hellenic Government should always have felt disinclined to allow foreigners to draw on the art treasures which lie hidden beneath the soil of Greece. But the offer made by the German Government differs materially from all others. It comes directly from the Crown Prince of Prussia, who is the official protector of all public museums in Prussia, and who, as is well known, is the worthy pupil of Professor Ernest Curtius. These two men took up the plan which had been

entertained by the French Government in 1829, had been revived by King Frederick William IV., and been urged on the public again by Professor Ross in 1853;—which had in fact been the desire of all archaeologists during the last fifty years, viz., to lay open systematically and methodically the ruins of Olympia. Their object in making the proposal to the Greek Government is not to acquire for German museums any of the treasures that may come to light. On the contrary, the German Government, though defraying all the expenses, renounces all claims to the possession of any of the antiquities that may be discovered. They will all remain in Greece, the property of the Greek nation. All that Germany asks for, is to be allowed to excavate, to have for five years the exclusive right of making casts, and for ten years the right of publishing reports of the excavations. A treaty to that effect was signed on April 25, by the Bulgarian Ministry on one side, and Professor E. Curtius on the other. One paragraph was added by the Greek Government: "Il dépendra de la propre volonté du Gouvernement Grec de céder à l'Allemagne, en souvenir et en considération des sacrifices que l'Allemagne s'imposera pour cette entreprise, des doubles ou des répétitions des objets d'art trouvés en faisant les fouilles." Unfortunately the Chambers were dissolved before they had ratified the treaty. It will have to be submitted to the newly-elected Chamber, and we hope we shall soon hear of the beginning of the great work. No one is better qualified to conduct and superintend these operations than Professor Curtius. "It is not idle curiosity," he writes in his paper on Olympia, "that is to be gratified; no dilettante whim, no display of wealth that prompts our enterprise; it is a duty for all of us to do all we can, in order to take full possession of the inheritance left to us by antiquity, and not to be satisfied with what is lying on the surface, or brought to light by casual efforts." MAX MÜLLER.

NOTES AND NEWS.

WE do not know whether the directors of public galleries in Europe have at any time had their attention called to a source of possible acquisitions which is suggested in a letter addressed to us by a well-informed correspondent at Valparaiso. Our correspondent points out how

"200 years ago, when the mines of Potosi were perhaps the most important in the world, the neighbouring city of Chuquisaca (now Sucre), the capital of Alto Peru (now Bolivia), abounded in wealthy families, many of them noble in the old country, who spent part of the wealth acquired in mining enterprise on objects of art for their own gratification, for the enrichment of the churches of the colony, or for the adorning of their private chapels or oratories. Many of these paintings have been taken in recent times to Lima, to Chili, and even to Europe; more have disappeared, or have been destroyed in the revolutions that for so many years have ravaged Bolivia. Some have been found in the hovels of Indians, and in low drinking-shops, and a diligent search might bring to light many gems of Spanish and Flemish art.

"A friend in Santiago de Chili writes me to the following effect:—

"There exists in Santiago a Virgin which, in the opinion of all the painters [of that city], is an original Rubens. It was taken [estruido] from a European gallery to which it belonged in the last century; it has been copied by an ancient [for Chili] painter, whose descendants exist in Santiago, and retain a copy of that period [end of eighteenth century or beginning of nineteenth]. It is a Virgin of life-size, rather more than bust, caressing the Infant, who stands upright in the attitude of turning from the spectator, and hiding himself in the bosom of the mother. The Infant is very beautiful, and is notable for the flesh-colour."

Still more important than the picture above cited, appears to be another ascribed to Murillo, and now in the possession of Herr Ernest Rück, of Sucre. Our correspondent has been good enough to forward us two photographs of this latter work, from which it is apparent that it is a

good work of the Spanish school of the seventeenth century. The subject is the *Vision of San Cayetano*, and the owner supplies the following account of its authorship and provenance:—

"Painted in oil, on a copper plate, by Bartolomé Estevan Murillo in Madrid, about the years 1643 to 1645. The picture, perfectly preserved, measures 48 centimètres in height by 38 centimètres wide. It was the property of the Cathedral of Charcas in the Department of La Plata [Bolivia]. It is in a frame of varnished oak, and was covered with a Venetian mirror-glass. The painting, after having been presented to the Cathedral by one of the former Archbishops, was given by the Metropolitan Council to the Ecclesiastic Governor, Senor Fernandez. After his death it passed through various hands into those of its present proprietor."

MR. ARTHUR HILL, B.E., has published by subscription his excellent monograph of the ancient chapel at Cashel, for which he received a silver medal from the Institute of Architects, a short time ago. The Cormac chapel, which was built as early as 1127, is especially interesting, as affording an instance of the early growth of Gothic architecture, for although it is distinctly Romanesque in character, we can yet trace in it many indications of the pointed style that was so soon to be developed and flower in luxuriant beauty. In this remarkable chapel the Gothic plant is still struggling for life. Mr. Hill's folio is illustrated by careful drawings, showing the chapel as it formerly existed, and also by two large photographic views of it in its present state, taken by Mr. Hudson of Killarney. Such a work is of great value as preserving a record of a building of great historic, as well as architectural interest.

WHEN questioned as to the non-appointment by the Board of Public Works of a competent person to superintend the works of conservation of the national monuments of Ireland, the Irish Secretary stated that no such inspector is needed, as the Board does not intend to "restore" any of the ecclesiastical remains vested in them. Mr. Graves, however, the learned Secretary of the Historical and Archaeological Association of Ireland, writes to the *Dublin Evening Express*:—

"I visited Cashel, the only building as yet actually vested in the Board, in the middle of last June, and found a very intelligent clerk of works, and a large staff of operatives, in possession of 'the Rock.' Mr. Reade, the clerk of works, kindly gave me every information as to the proposed operations, and I found that besides the works of simple conservation it was intended to restore—

- "1. The bishop's palace or castle.
- "2. The vicar's hall.
- "3. The east window of the cathedral.
- "4. The buttresses of the cathedral.
- "5. The battlements of the cathedral.
- "6. The enclosing wall of the Rock."

In a subsequent letter, Mr. Graves concludes from an answer of Lord Beauchamp to Lord Carlisle, that

"all idea of restoration at Cashel has been abandoned, and that the works there (except in the case of the enclosing wall, which certainly ought to be crenelated in the Irish style, and thus rendered as little like a prison wall as possible), will be confined to what is required for the efficient preservation of the existing remains."

He also comments on a "perfectly astounding" sentence of Lord Beauchamp's reply, which is to the effect that "the work of preservation would be better discharged by a surveyor than by a person possessed of archaeological tastes and knowledge!" It should be remembered that the ancient churches and round towers of Ireland are unique, and are of a type entirely different from that presented by English or continental remains of the same age. English archaeologists are such sufferers from official ignorance and incapacity at home, that they have no difficulty in sympathising with those of Ireland in their wish to preserve the distinctive features and character of the national monuments which time has left.

GUILDHALL, it may be supposed, will soon bloom forth in great splendour, for at a meeting held a short time since; it was resolved on the motion of Mr. James Edmeston, that an architect should be instructed

"to prepare and submit for the approval of the Court, a complete design for the polychromatic decoration of one bay of the wall-surface and roof of the Guildhall, drawn to a large scale, so that the decoration done from time to time, when the hall is prepared for great occasions, should be part of a well-considered whole, and not, as at present, a fragmentary effort."

We must confess that there are few architects at the present time to whom we should like to entrust the "polychromatic decoration" of this old civic hall.

THE writer of an article on "A Lost Art" in *Scribner's Monthly* for August wishes to convince us that the curvature observed in the horizontal lines of the Parthenon at Athens, and elaborately examined by Mr. Penrose, with the result of showing that it was intended to correct optical effects, was in reality intended to produce optical effects. The writer in question had got upon this track by noticing the well-known obliquity of lines in the Cathedral of Pisa, an obliquity which he is doubtless quite right in tracing, not to a sinking of the parts of the building, but to the original design of the architect. But when he says that the spirit which prompted this obliquity of design among the early architects of Italy had been handed down from the Greek masters, on no other grounds than that the Cathedral of Pisa was the work of Byzantine architects, and that a slight curvature has been observed in the lines of certain Greek temples, we can only confess that the chain of argument appears to us particularly weak.

THE *Annali dell' Inst. Arch.* of Rome for 1874 will contain an article, of which we have received a copy in advance, by Professor R. Kekulé, of Bonn, on the subject of an archaic marble head of a goddess in the Villa Ludovisi, Rome. Professor Kekulé draws attention to the similarity in style existing between this head and the head of one of the two marble statues in Naples, well known as being copies of the ancient group in Athens representing the tyrannicides, Harmodios and Aristogeiton, by Antenor, or perhaps as copies of the same group restored by Kritios and Nesiotes, the group of Antenor having been carried off by Xerxes. He thus obtains an approximate date for the head, and further determines it to have come from an Athenian school. The next point is to find a name for the goddess whom it represents. The name of Juno which it once bore has been long given up. Professor Kekulé chooses that of Venus.

SIMULTANEOUSLY with the Exhibition of the Union Centrale, was opened by the Minister of Public Instruction a gratuitous exhibition of the products of the national manufactures of Sèvres, the Gobelins and Beauvais. Sèvres sends eighty-six specimens of hard paste, mostly in "pâtes d'application," by Gely, Regnier, and others of her first artists, and about twenty examples of porcelain tendre. Also an interesting series of drawings which have served for the decoration of the pieces, some dating from the earliest establishment of the manufacture at Vincennes. The Gobelins tapestries consist of a *Charity*, after Andrea del Sarto; the *St. Jerome* of Correggio; three after Boucher, and eight panels for the new opera-house, designed by Mazerolle, probably for the buffet, as wine, tea, and patisserie are among the subjects, the choice and execution of which reflect no credit on the artist. The two carpets destined for the palace of Fontainebleau are greatly wanting in harmony of colouring. The products of Beauvais are confined to the seats of chairs and sofas, and panels for screens, of which there are various pieces executed in the styles of Louis XIV., XV., and XVI.

THE *Giornale di Treviso* states that one of its

fellow-citizens, Signor Sante Giacomo, has left his fine gallery of pictures to the city, on the condition that within six years of his death a pinacotheca shall be built, with a room reserved for his collection, which consists of works of the principal modern Italian painters, Podestà of Rome, Liparini, Politi, Gregoletti, Schiavoni (father and son), Paoletti, Zona, Moretti Larese, Caffi, Carlini, Giacomelli, Quereni, and many others.

WHEN, in 1872, the Musée des Souverains was suppressed by order of the Minister of Public Instruction, the collection, consisting of 525 objects, which had belonged to the Kings of France from the fifth century to the restoration of the Bourbons, was at once dispersed, and the specimens restored to the different museums from which they had been taken. The famous chair of Dagobert went back to the National Library, together with a number of engravings and manuscripts, among which was the letter of Marie Antoinette to Madame Elizabeth, woven upon a piece of Lyons silk. The Musée d'Artillerie received the arms, the church of St. Denis the sacred vessels, and many other objects were given back to their original donors.

SIGNOR FUMAGALLI, a Milanese gentleman, has bequeathed 80,000 frs., the interest of which is to be applied to an annual prize of encouragement to a young Italian artist for a work either of sculpture or painting.

A CHURCH of some architectural pretension has recently been built on the Avenue de la Grande-Armée in Paris. Its porch is a good imitation of the Flamboyant style of architecture, prevalent in the fifteenth century. It is called La Chapelle évangélique de l'Etoile, and is one of the churches of the reformed faith in Paris.

AN exhibition of industrial art is now being held at Milan. It is reported to contain more works of ancient than of modern art, a peculiarity which most visitors will willingly pardon. The *Gazette des Beaux-Arts* promises a review of this exhibition, which the *Chronique* affirms "abounds in inappreciable riches." France is represented at it by three splendid tapestries belonging to the King of Italy representing mythological subjects after Boucher, and the history of Don Quixote after Coypel.

THE Baron Anselme de Rothschild died lately at his château of Dobling. He was a connoisseur of great knowledge and taste and leaves a magnificent collection of paintings, chiefly by Dutch masters, carved ivories, enamelled snuff-boxes with miniatures, rare manuscripts and other art objects. His hotel at Vienna was decorated on the outside with panels by Prud'hon that had formerly ornamented the dwelling of his father, the Baron Salomon de Rothschild, in Paris.

BESIDES the costume exhibition of the *Union Centrale*, an interesting collection of objects illustrating the manners and costumes of the sixteenth and seventeenth centuries has been made in Holland, and is now being exhibited in the Town Hall of Zaandam, a quaint old town near Amsterdam, where Peter the Great resided for some time when studying the art of shipbuilding. The exhibition is reported to be exceedingly well arranged. The objects have been selected with great care and discrimination.

THE well-known numismatic cabinet of the Museum at Jena has recently been materially enriched by the presentation on the part of the Grand Duke of Saxony, of the extensive collection of Chinese and Japanese coins, made by Herr J. von Siebold during his prolonged residence in Japan. This unique collection, which is arranged chronologically, and extends from the year 221 B.C. to the present times, is essentially Japanese, although it contains genuine Chinese coins down to a comparatively recent period. This is owing to the singular fact that the Japanese, like some of the other nations occupying lands near the empire of China, made use of Chinese money as their

only currency. As early as the year 950 the Japanese began to coin copper money, but they adopted no special coinage of their own, and continued for ages to copy the Chinese pieces in shape, consistency, and inscription. At the beginning of the seventeenth century, owing to internal disturbances, the Japanese discontinued the coinage of these square copper pieces, and used the genuine Chinese money, especially that of the Ming dynasty, but at the close of the civil wars in the first year of Kwang-yei (1636) the fabrication of copper money was resumed, and since then these coins, known as Sen, have generally retained the name and superscriptions of the Kwang-yei dynasty.

THE STAGE.

THE STAGE UNDER LOUIS QUATORZE.

If any English reader should care to follow in full and wearisome detail the pecuniary relations between dramatic writers and the actors who interpreted their works in the seventeenth and eighteenth centuries in France, he had better get possession of a little book which has been sent to us, called *Les Auteurs Dramatiques et la Comédie Française à Paris*, published very lately by Léon Willem, 8, Rue de Verneuil. It forms a part of what may be described as the archaeological collection issued by this gentleman, and it is compiled by M. Jules Bonnassies, who has had access to the archives of the Théâtre Français. From these he has exhumed an amazing number of contracts and regulations, the perusal of which will be a source of delight to those for whom the dry bones and the dust of things are much more interesting than human life and thought.

It is in this sense, and in this sense only, that we can speak of the book if the book is brought before us as a work to be read. If, on the contrary, it is regarded simply as a book to be consulted, then it may possibly have its use and its interest; and doubtless French dramatic authors who are not coached in the subject already, will be glad to see how much their condition is better than that of their brethren two hundred years ago—how indeed the condition of their craft has been always gradually and steadily improving, till at the present time (what with their large percentage upon the gross receipts of the theatre) it is by no means unenviable. But even the dramatic author, going to the book because of his near personal concern with the subject, might reasonably complain that the substance has not been put before him in any but its crudest form. An essay, an abstract, an *aperçu*, would, if founded on the materials in the archives, the more completely have enabled him to remember that which he may desire to know. As it is, he cannot go to M. Bonnassies's little book for anything better than the raw material out of which a book of some human interest might conceivably be made.

Dip here and there and you come upon details that are curious, such as Mdlle. Beaupré's complaint of the wrong Corneille had done to the company at the theatre in the Marais by intriguing and arranging to be paid much more than the "trois écus" with which submissive authors had hitherto very often been rewarded—the enlightened woman deemed it a grievance that any considerable value should attach to creative work. Putting aside the elaborate array of documents bearing on the pecuniary relations between authors and actors, which forms the main part of the book, but which we conceive to be the dullerest reading of any which does not profess to be comic, we may mention a strange custom that obtained during the days of Louis Quatorze, when authors (whether those attached to the theatre, or those who were outsiders seeking a chance entry for their work) were never accustomed to submit their work to any responsible body or responsible person for decision, but were wont to single out some one actor or actress, who, with even greater action than he would use upon

the stage, read aloud the work that aspired to acceptance. The piece was not written specially for this one person. His task was in that respect disinterested. "One-part pieces" are creations of a later day, though there can be little doubt that Molière considered himself and his own acting in the composition of many of his plays. The accuracy of this little book—to say a last word of it—is hardly open to question, though its interest is. It follows closely enough its subject from Molière's days to Beaumarchais's. It is charmingly "got up," with head and tail pieces, initial letters, and seductive paper, low-toned and pleasant to the touch—*papier vergé des Vosges*, which, if it be not very dear, the publishers might give us more frequently. It is only a pity that this material adornment should not have been bestowed upon a book of thought and value. But then a book of thought and value would not have required it.

Now the new work by M. Eugène Despois (*Le Théâtre Français sous Louis Quatorze*. Paris: Ilachette, 1874) is a work which you may read and be none the worse for. The writer has not only possessed himself of his facts; he has digested them. Here it is indeed an author, and not merely a compiler, who has been busy, and he has thrown into some artistic form the material that came to his hand. His subject itself is an interesting and a wide one, and he might have made it wider still, but he has wisely avoided purely literary criticism, which gifted men have given us before and will give us again, and has confined himself to the history of the Theatre, in some of its moral and material aspects, and this he has given us well. There were three theatres in Paris, it appears, during the first part of the reign of Louis Quatorze: l'Hôtel de Bourgogne, le Théâtre du Marais, and la Troupe de Molière. At Molière's death in 1673, his company and that of the Théâtre du Marais amalgamated at the Hôtel Guénégaud. For seven years afterwards there were but two troops; then there became but one, out of the union of these two. That was in 1680, and the arrangement lasted five and thirty years, and the comedians were called "les Comédiens du Roi." That was in fact the beginning of the Comédie Française. A brilliant array of talent was the consequence of the union, or the restriction, just as a somewhat similar restriction, at the end of the last century, produced likewise for a short time an equally brilliant array. In Molière's own day the more serious pieces were played at the Hôtel de Bourgogne; and Molière, when he came to Paris from the country, spoke flatteringly of that theatre's distinction, and modestly of the merits of his own little troop. And his own little troop played chiefly his own pieces: in all the fourteen years that it existed during his lifetime, it played only fifteen new pieces composed expressly for it not by him; and as these indeed were the days of short runs, it was not much to introduce about one piece a year by some other than the master's hand. Among the fifteen pieces so produced, it is interesting to reckon two of Racine's and two of Corneille's.

As for the estimation in which Molière himself was held, that altered as time passed. When he was thirty-five, Des Reaux wrote of him, "A fellow named Molière writes pieces in which there is wit. He is not a wonderful actor, save perhaps in what is ridiculous. His troop alone plays his pieces. They are comical ones." We know what that genius did for the keen sad man who possessed it. It gained him during his life the contempt of lacqueys, and at his death a refusal at Saint Eustache to give Christian burial to his bones. And when he died, the rival company was eager to perform his pieces. "To-day," writes Chapuzeau, in 1674, "the question is, which of the two troops plays his excellent pieces best; and as many people run to see them as if they had still the advantage of novelty." The register of the comedian La Grange—who was attached to Molière's troop, and who loved tenderly that sad keen man—places within our knowledge all sorts

of really interesting details concerning the professional career of Molière. M. Despois has used it sparingly, because it is not now for the first time in circulation, but his book is full of readable things not only about the native theatre, but about its sometime fashionable rivals from Italy and Spain; about its conflicts with the religious world—à propos of *Tartuffe* and much besides—nor does it neglect to take into consideration the position of the men of letters who found the fuel for the theatrical fire, and for whom, be it remembered, at that time the theatre was the only means by which they might gain anything further than the reward of laurels and a name. The whole subject, were one not pressed for space and time, would be an attractive one. It would be interesting to trace the careers of the French players who were contemporaries of our Jack Lacy, our Thomas Betterton, our Nell Gwyn, and Mrs. Knipp (the jade whom Pepys was so glad to see); it would be interesting to trace their careers throughout the long life of their sovereign patron in the reflection of whose greatness they themselves were great (not so much, indeed, when they wrote *Tartuffes* as when they had the honour of helping in making the royal bed). Here in this book of M. Despois some of their stories are followed, from the day when the great monarch deigned to laugh at the first wit of Molière, to the day when, amidst gathering national discontent, the theatres were closed, and they were burying him who was Louis le Grand no longer, for “*Dieu seul est grand, mes frères*,” the preacher had said, that day.

FREDERICK WEDMORE.

MR. IRVING'S “starring” engagement at the Standard Theatre closes to-night. He has been appearing, during this week, in *Philip*, which has a pretty beginning, a dramatic continuation, and an impotent end.

It is to-night, at the Haymarket, that Mdlle. Beatrice will appear in the English adaptation of the famous *Sphinx*.

THE Vaudeville Theatre closes this evening, to re-open next month, we hear, with a comedy by Mr. Gilbert.

THE Lyceum performances of the *Grand Duchesse* shortly conclude, but *opera-bouffe* will not die off the London stage. It will be revived on Monday at the Opéra Comique, when *The Broken Branch* will be performed, on the occasion of the re-opening of this theatre under the management of Mr. D'Oyly Carte.

The last nights of the *Jolie Parfumeuse* are announced at the Alhambra.

MR. MARK SMITH, an American comedian, who, if we mistake not, figured very creditably at the St. James's Theatre, four or five years ago, in Miss Herbert's revival of *She Stoops to Conquer*, died suddenly the other day, in Paris. He had just come back from witnessing the successful *debut* of his daughter on one of the lyric stages of Italy.

WEDNESDAY was a brilliant night for the little theatre of the Palais Royal. Ravel's wife, known on the stage as Mdlle. Elise Deschamps—an actress, be it avowed, of no great value—took a benefit then, and in addition to the typical Palais Royal performance, several players from the Gymnase appeared in *Les Grandes Demoiselles*, and two artists from the Français—Coquelin and Mdlle. Sarah Bernhardt—appeared in the witty one-act piece called *L'Acocat*: a piece which exhibits the quarrels of a young husband and wife who begin by settling the terms of their separation and end by philosophically acknowledging that neither of them would be much happier when separated, nor better pleased upon the whole with anybody else.

THE Théâtre Français has revived the *Gageure Imprévue*, by Sedaine; and several critics have found it of no great value. It is nevertheless held by other critics as competent to be an artistically

conceived and artistically executed little piece, and these see in it one of the first pieces in which a moral thought received dramatic form. What, asks one of these, is the leading idea of Sedaine?—What is the moral here dramatically conveyed? It is, that those who in the conduct of life love finesse most when it is carried furthest, and becomes astuteness, generally take useless trouble in carrying it so far: that simplicity would after all lead them more quickly to that desired end which astuteness can reach only when they are weary of it. The proposition, the leading idea, may be true or false. We have nothing to do with its truth or its falsehood. It boots only to enquire whether it has found able dramatic expression. One of the complications of the piece is obtained by a principal personage—the always wily Mdlle. de Clairville—making a secret of that which she might readily have avowed. The thing is unnatural, say the objectors; it is done merely to get fresh complication. But probably it is done because it is the act of an over wily character, and its very uselessness, which people see, makes its dramatic truth, which they do not see.

THE new act or tableau of *Orphée aux Enfers* at the Gaîté, destroys the symmetry of the work, and, as by itself it lasts nearly one hour, has the effect of making the whole piece of tiresome length. But we are assured that it will draw the provincial public, and many Parisians too, to see the new spectacle—a spectacle gorgeous with we know not how costly decorations, and enlivened by ballets, which a French critic pronounces to be among the exhibitions which he would prefer to see abandoned to “the coarse crowd in London.”

THE acting at the Théâtre de Cluny of M. Paul Clèves and Mdlle. Orphée Vial, would do something to prolong the vitality of Eugène Sue's *Martin et Bamboche ou les Mystères des Enfants trouvés*, if the change in public taste during the twenty-five years that have passed since the production of the piece had not made long life impossible for it. The story is extravagant, and the action takes place somewhat too much behind the scenes. On the stage there is little but prolix narration, varied by murderous attack.

MUSIC.

THE prospectus has just been issued of a new musical society, bearing the somewhat ponderous title of “Musical Association for the Investigation and Discussion of Subjects connected with the Art and Science of Music.” The society is intended to be similar in its organisation to existing learned societies; and its object will be the reading and discussion of papers on subjects connected with music, actual performances being limited to the illustration of the papers read. The first list of original members, which is given with the prospectus, includes the names of a large number of musicians of every school and of every shade of opinion.

THE *Neue Zeitschrift für Musik* states that Wagner has at last met with a worthy representative for his Brünnhilde in his “*Nibelungen*” dramas, in the person of Frau Materna, of Vienna. The part in question, as those acquainted with the music will be aware, is one of the most exacting in the range of musico-dramatic literature.

THE recent musical festival at Munich is said to have been completely successful. For the benefit of the singers a special performance of Wagner's *Walküre* (which has as yet been heard in no other city) was given.

MESSRS. BREITKOPF AND HÄRTEL are preparing a complete edition of the works of Mendelssohn, similar in form to their fine collected edition of Beethoven issued about ten years since. Herr Julius Rietz is to be the editor.

THE Academy of the Royal Institute of Music at Florence have just published in the twelfth

volume of their *Transactions*, a memoir by the Cavaliere Puliti, which is likely to raise a musical storm in France and Germany, as he claims in it the honour for Italy of having first invented the pianoforte, an invention ascribed by the French to Marius, and by the Germans to Schroeter. Cavaliere Puliti triumphantly proves that Bartolommeo Cristofori, of Padua, was the first to make the improvements which changed the harpsichord into the pianoforte. He rests his assertion upon the following unquestionable document:—

“1711. The *Giornale de' Letterati d'Italia* publishes the description of a harpsichord with the pianoforte invented at Florence by Bartolommeo Cristofori, of Padua, and announces that the inventor had already made three instruments with this mechanism, and another, also, with the ‘piano e forte’ of more simple construction.

“1716. The Royal Academy of Science of France approves of a new harpsichord of M. Marius, in which he has substituted hammers for striking instead of the crow-quill nibs inserted into slips of wood (sautereaux) of the harpsichord. The designs sent in by Marius were not published by the Academy until nineteen years later.

“1717. Christopher Theophilus Schroeter conceives the idea of substituting hammers for the nibs of pens of the harpsichord and, in 1721, presents to the Electorate Court of Saxony two models of his invention. The public had no knowledge of this except from Schroeter's letter to Milzer, published seventeen years later, and the designs were only known forty-two years afterwards by the *Critical Letters upon Music*, published by Marburg.”

How so many writers should have fallen into the error of ascribing Cristofori's invention of the pianoforte to 1718, while a description of it was published in 1711, is thus accounted for by the Cavaliere Puliti. The *Giornale de' Letterati d'Italia*, in which it was first described by the Marchese S. Maffei, was a scientific and literary review of very limited circulation, and the few copies printed became suddenly rare and little known, while a collection of “*Rime e prose*” by Maffei, published in 1719, was more extensively known, and in it appeared, without reference to the title or date of the work from which it was taken, the description of the “*gravecembalo col piano e forte*”—the harpsichord piano forte.

Ueber Land und Meer states that Herr Ullmann, the well-known impresario, is at present in treaty with Christiane Nilsson in reference to an absolute engagement for next season. Fräulein Nilsson will make a professional tour through Germany for Ullmann's account.

THE *Sicile* announces that at the approaching distribution of prizes at the Conservatoire de Musique, the composer Verdi will receive the cross of Commander of the Legion of Honour.

No. 121, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

LITERATURE.

Spain and the Spaniards. By N. L. Thieblin (Azamat-Batuk). Two Volumes. (London: Hurst & Blackett, 1874.)

TOWARDS the end of the second volume the author apologises for the title of this book. He finds that he has "scarcely said a word on what I wished to speak of when I set to work." Instead of writing something "nicely descriptive of Spain and the Spaniards, I find myself to have written a series of dull recollections of Spain, and of still duller essays on Spanish subjects." The main body of the work is a *réchauffé* of letters and articles which appeared originally in the *New York Herald*, when the author acted as special correspondent of that journal in Spain. It is only in the last forty or fifty pages of the second volume that he really attempts to give some general idea of Spain and the Spaniards. The only parts of Spain, however, with which he shows any detailed acquaintance, are Madrid and the Basque Provinces. Still the book is an interesting one. The writer was well provided with introductions to the leaders of the different political parties; and he found those leaders, male and female, of all parties alike, not averse to being "interviewed." The result is curious and somewhat amusing. Everyone is described pretty much at his or her own valuation; and consequently all his or her actions are depicted under the brightest aspect. Only a few shades of darker tint appear when those in the process of being interviewed indulge in anecdotes about others. Thus, Figueras' opinions of Castelar, Elio's of Serrano, and the Countess of Montijo's of several of her contemporaries come in most opportunely to balance the self-appreciation of the parties themselves. It is amusing too to mark how much an after acquaintance modifies the judgment pronounced on a first interview. This is especially notable in the case of Don Carlos, or Carlos Septimo, as his partisans call him. He was first interviewed, April 11, 1873, at the Château of M. de Pontonx, near Peyrehorade, and, having evidently been crammed for the occasion, comes off with flying colours, as a thoughtful, somewhat liberal, politician, and an amiable, high-minded man. But a closer subsequent acquaintance completely alters the opinion first expressed. The thoughtful politician of vol. i. appears early in vol. ii. p. 26, as "in the present condition of his ideas and views no more fit to govern a people than the author of these pages is fit to be Archbishop of Canterbury." He is presented to us then as "surrounded by a brilliant staff, upon the formation and arrangements of which he has, I believe, bestowed more thought than on any other subject in the whole of his life" (vol. ii. p. 25); a staff, numerous beyond all proportion to its utility, and composed in great part of foreign "mere petty military adventurers."

The amiable young gentleman of the Château de Pontonx turns out to be "a man who does not particularly interest himself in the comfort of others, provided his own wants are attended to, so the members of his staff had frequently to content themselves with accommodation at the best only fit for pigs."

And with this our own private information agrees. Don Carlos' handsome presence and personal courage disposed many a partisan in his favour at first sight, but little by little these opinions have changed. The extreme devotedness, the heroic self-sacrifice, the toils and privations of the noble Basque peasantry and gentry for their king, have produced no corresponding exertions on his part. All serious business that can be shirked is shirked. His powerful frame bears well the marching and out-of-door life of the campaign; but, "le roi s'amuse," and more than once the king's amusements have been the cause of greatest detriment to his arms. Some of the older men, who have spent their lives in the cause, speak with bitter tears of their disappointment in their king, and say, "that were it not for 'la causa' they would not stir a step further for him."

A large part of these volumes is taken up with a description of the progress of the Carlist arms, and with speculations on the future prospects of the cause. The present war is frequently compared with that of 1834-40, of which a rapid sketch is given in vol. ii. ch. 2. But the author has hardly seized the points of difference. Had the present Don Carlos possessed any general at all equal to Zumalacarregui, he would, we believe, have been long ere this in Madrid. It is *there* his real difficulties would have begun in the conquest of the South and of the large commercial towns. But the present war, except in Catalonia, has been carried on in a wholly different manner from the last. Then Zumalacarregui and his fellow-leaders were almost always the attacking party, swooping down from the mountains on convoys, surprising and falling on columns many times their strength, and often defeating them. But hitherto, the Carlist leaders have almost always remained on the defensive and waited the attack, as at Puente de la Reyna, Tolosa, Somorrostro, and Abarzuza. Now arms and artillery are imported from abroad, then Zumalacarregui and others took them from their foes. When the present leaders have gained a victory they seem not to know what to do with it. After the repulse of Moriones at Somorrostro, they had but to cut the rails behind him, and his army would have been almost at their mercy, but they did nothing. After the victory and death of Concha at Abarzuza, they gave Don Carlos and Doña Margarita a "mascarade!" Fortunately for them their opponents are almost as unskilful and are generally in an almost worse plight than themselves, being unable to advance from deficiencies of pay, commissariat, and supplies of all kinds.

But that the Carlist cause should win, at least to the extent of getting to Madrid, if only they had a man of real military talent among them, or if Carlos VII. were at all like Henry of Navarre, we think, can-

not be doubted. Notwithstanding all petty jealousies and disputes among the Carlist leaders—and the French Government have done them the greatest possible service by putting the most formidable of these dissentients, Santa Cruz, out of the way, by internment at Lille, just as he was preparing another attack upon his old enemy Lizarraga—the men know what they are fighting for and are enthusiastic in the cause. It is no matter that thoughtful men say that it is all a huge mistake, one of the many ironies of history; that the Basques who are practically in the enjoyment of one of the best republics in the world are attempting to force absolutism on the rest of Spain, and are thus endangering the very "Fueros" which they justly value so highly; all this does not affect the fact that the Basque soldiers are really in earnest, and fight as men fight only when they are really in earnest in what they believe to be a good cause. On the other side the troops of the Government hardly know what they are fighting for; the officers are divided, not by personal and professional jealousies only, which will exist in almost all armies, but by profound oppositions on political, social, and religious questions. Half of them would as soon see Don Carlos on the throne as a republic established, although they might prefer Don Alphonso to either; and these differences paralyse the movements of the Republican forces. One cannot but remark the liberality with which troops and supplies were furnished to Serrano and Concha, and the comparative parsimony with which they are dealt out to Moriones and the other generals. Still he would be a daring prophet who would predict anything of a country of which even the inhabitants say, "In Spain that which is impossible is sure to happen."

M. Thieblin, perhaps in some measure because writing originally for an American journal, argues strongly in these volumes in favour of a Federal Republic, as alone suited to the present state of Spain. No doubt the majority of the Spaniards are Federals in a sense. The Basque provinces may even be cited as an extreme instance of Federal government. Not only have they the general "Fueros" or "provincial charters" by which the general privileges of the provinces are established, but in the provinces themselves are numerous petty confederations of five or six villages, towns, or valleys, whose deputies meet annually in rotation at the chief places in each, and transact all local business, taxation, &c. But this does not prove that Federalism would be good for Spain. In the Morocco war, the slowness of the Basques in raising their contingent was a source of great weakness to the country. The local jealousies, internal custom-duties, want of connected roads, would all be increased by Federalism; while the "pronunciamientos" of political generals, bad as they are, would be poorly exchanged for "pronunciamientos" of provinces against the central power; for some kind of centre there must always be. Moreover, the experiment has been tried in Spanish America, under far more favourable circumstances than are likely to exist in Spain, and has succeeded but ill. In the Argentine Con-

federation one or other of the provinces is in almost continual revolt against the central power; while in spite of foreign capital and resources the central power has become so weak that the Indians have definitively regained a strip of territory 200 miles broad from the Parana to the Cordilleras, and make their raids almost to Rosario, a thing unheard of when there was a strong Government at Buenos Ayres. Similar effects of central weakness without any corresponding provincial gain, would in our opinion follow any attempt at Federalism in Spain.

In his farewell chapter, entitled "Adios," the author leaves war and politics, and endeavours to give some account of what sort of people the Spaniards really are. In much of this we cordially agree. With M. Thieblin, we believe that the Spanish soldier, if only by some marvellous change he could be properly clothed, armed, paid, fed, and above all, led by capable officers who would pay attention to his wants, might again become what he once was, the finest infantry soldier in Europe. He is certainly one of the most sober and enduring: and among men of all nations the Spaniard has been found the last to leave, or to grow nervous on, a solitary outpost. Of the general politeness of all classes of the nation there can be no doubt. But while on this account we hold that a Spaniard is often the most delightful companion in the world, we at the same time have no wish to have the slightest dealings of a graver nature with him. Of punctuality, of business, of keeping his word, in the English sense, as to time, place, &c., he has not the slightest idea; of talk, of eloquence he is profuse, but of deeds most sparing. His ignorance, too, is generally profound, not from any lack of intellectual power, but solely from utter want of education and training. Those who have studied with Spaniards at the universities and seminaries speak with the utmost respect of the "dura cabeza Española" as capable of an amount of sustained mental toil which only a German brain can rival.

Of the Spanish lady our author is a most enthusiastic admirer. "You must take," says he (vol. ii. p. 231), "all the virtue of the most virtuous Englishwoman, all the grace and wit of the most graceful and witty Frenchwoman, and all the beauty of the most handsome Italian woman, to make something approaching to a perfect Spanish lady." This is too much. But that the Spanish woman, with exceptions perhaps in the large towns, is as virtuous and makes as good a wife and mother, according to her lights, as those of any other European country, we firmly believe. As to her tact in conversation, in spite of all her ignorance, there can be no doubt; a man who can talk to a Spanish lady at all must be a dolt indeed if he does not soon find himself talking better than ever he did in his life before; and this, we think, is the best possible proof of her skill in the art of conversation. As to beauty, that must always remain a matter of taste; but however beautiful the European Spanish lady may be, she is certainly surpassed in that respect by her South American sisters. With all this, she is often as little open to reason as a child. Of comfort in the

English sense, she has not the slightest notion, either in house or table; and she is rarely "visible" before the afternoon. Gentle and kind as her manner may be, if by chance her passions get thoroughly aroused, there is no crime at which the vengeance of a Spanish woman will stop; and some of the worst deeds of cruelty we have heard of have been instigated by ladies whom from their manners in society you would believe to be incapable of injuring a fly. The present Carlist war is undoubtedly an improvement on the last; but we cannot agree with the writer as to the lack of cruelty among the Spaniards, and we believe it to be mainly a result from their indifference to animal suffering, an indifference kept up, if not acquired, by the witnessing of bull-fights. There is brutality enough in the roughs of our Black Country and of our large towns, there are fearful cruelties practised on board our own and American merchant vessels, the tiger-like ferocity of a French mob is hideous in its insanity of fury, but we think no European nation can parallel the wanton delight at the sight of suffering which a Spaniard will exhibit.* Of this an instance (which was repeated a few years back on a poor idiot on the frontier), is given in a note in vol. ii. p. 83:—

"The way in which Gomez treated those who opposed him is nicely illustrated by the story of his having once ordered a Castilian curé, who professed liberal opinions, to be shod on hands and feet with donkey shoes, and to be harnessed as a baggage animal. And when the curé proved incapable of performing such duties for any length of time he had him shot."

All that is graceful, and agile, and daring in a bull-fight is capable of being performed without cruelty, though perhaps not without danger. Any one who has seen a South American Guacho charge and knock over a bull without injury to himself or horse, or two of them perform the more difficult feat of riding one on each side of an escaped bull, and without touching or being touched, force him back to "corral," in spite of his desperate charges at horse and man, will vouch for this.

But, after all, Spain is a country of contradictions. We have known ladies, travelling, and residing there alone, delighted with it; we have known others return almost in tears at the insults offered them. We have known men declare that the Spaniards are the best fellows, and Spain the finest country, in the world; while at the same time others have come back from a half-finished tour pelted by the "gamins" in the streets. It is singular how different the experience of a special correspondent travelling with the Carlist staff through a Carlist country is from that of the ordinary traveller, e.g., vol. ii. pp. 297, "Whether you knock at the door of an inn, or of an isolated farm, all the women of the house come to receive you, and there is not a thing that will be refused you." The trouble of the ordinary traveller is generally first to find anybody at all in a Spanish inn (we do not mean hotels in the towns), and next to secure either bed for the night, or anything to eat. Often he has to go

* This is allowed by F. Caballero, than whom no more thorough-going Spaniard exists, and is brought prominently forward in her novels.

himself and forage for the latter through the village. And when at last it is cooked after long waiting, the service is mostly done with a cool nonchalance that seems meant to impress the stranger with the idea that he is not wanted there, and that it is a great favour to wait upon him at all. For honesty and fidelity the Basques and the Gallegos are renowned. We have seen the latter habitually trusted as men of no other nation would be. Nor have we usually met with the savagery which marked the author's servant, vol. ii. 306-7. This we do not think is to the credit of Spain; for we have known a wild Arab boy quite as ready and faithful, and who showed equal grief at parting from his master, but no such sullenness and ill-temper as did Cipriano Solano at the last. But "Cosas de España" are things difficult to understand, and we do not give our own impressions as infallible. Only perhaps, on the whole, we think that a better idea of what Spaniards, and especially Spanish women, really are, is to be obtained from an intelligent perusal of the novels of Caballero and Trueba, than from all the journals of tourists and correspondents put together. In saying this, we do not at all wish to prejudice the reader against the book we have just reviewed. For the English reader, it is one of the best of the kind with which we are acquainted, and will remain a most valuable, because an impartial, contribution to the history of the early campaigns of the Carlist forces in the present war. WENTWORTH WEBSTER.

Les Chansons Joyeuses. Par Maurice Bouchor. (Paris: Charpentier, 1874.)

MR. CARLYLE is responsible for the statement that the Arabs used to indulge in public festivities when a new poet appeared among them. Ambassadors came from tribes at other times unfriendly to congratulate the commonwealth, and more joy could scarcely have been exhibited if a distinguished mare had given birth to a foal. Modern society has learned to take the advent of a poet more calmly; indeed, the bard's relations generally snub him, much as the Zulus do a tribesman who shows symptoms of becoming a diviner, or medium, as we should call it. "You will turn a soft-headed fellow, that sits by his fire and does nothing but divine," one Kaffir will observe to another with all the frankness of an early friend. And the bright lyrist nowadays, who looks as if he meditated publishing, is commonly rebuked in much the same way, especially if he happen to be a minor. This is the position of M. Bouchor; but France seems to have determined to make an exception in his case. There are very many young poets in France at present. Their works are generally printed very nicely, and have pleasant vellum covers. An etching of the minstrel's portrait usually forms the frontispiece, much loving care being devoted to his flowing locks. It is allowed that these pretty volumes have but a small sale; the coarse public in fact never does care much for sonnets. But M. Bouchor's book appears in a very different way, and has met with a much heartier welcome. It comes to the test in the classical yellow covers of

Charpentier, and the very name *Les Chansons Joyeuses* shows M. Bouchor's contempt for the melancholy Parnassiens.

"Je hais jusqu'à la mort ce siècle qui larmoie," he says, and aims at a more frank and Rabelaisian tone. Now most French lyrists are either studiously gloomy or studiously gay. They sit in the dust or in the sawdust, they share the despair and repentance and the mad mirth of Villon and Regnier. It is only of late that the disembodied school has found disciples in France, that the poets have lamented their inability to believe, or deny, to suffer, or be glad. M. Bouchor is quite determined to be glad, and perhaps the most vigorous lines in his book are his challenge to the clique of idle singers of an empty day.

"Je crois que vous prenez des poses de théâtre;
Je ne distingue pas votre air sacerdotal
De l'air jésuitique, et, sous le masque en plâtre,
Je ne lis sur vos fronts aucun signe fatal.
Vous ne voulez pas être applaudis par les masses.
Et solitairement vous planez dans les cieux?
Pour vous montrer à nu, moi qui hais les grimaces,
J'irai bien relever votre robe de dieux.
L'on vous verra claquer des dents, mornes et pâles,
Maigres à faire peur, et tout roués de coups,
Et quand vous chanterez, il sortira des râles
De ces timbours crevés, qui sont vos cœurs, à vous."

M. Bouchor and his friends are to change all that—

"Mais nous, dont la vigueur encor se développe,
Le front levé parmi les sots et les moqueurs,
Nous voulons, en dépit de cette vieille Europe,
Garder comme un trésor la jeunesse des cœurs."

The negative side of all this, the contempt of affectation, the assurance that life is not "played out," as Mr. Swinburne calls it, is genuine and sincere enough. But when we come to consider M. Bouchor's own notion of what life is, and what enjoyment, his sincerity is less pure, and his philosophy anything but satisfactory. Any one may answer to people who whine about existence, that life in all its shapes of pain and delight is its own exceeding great reward and consolation. The game is worth seeing out, and this farce, in which we are puppets, may be enjoyed if we think of ourselves as spectators. But M. Bouchor's philosophy is more limited than this. He makes youth, with its passions and pleasure, the sum of life, and in this he only repeats the burden of De Musset and of Mürger. To be sure he understands youth in a more healthy way than these unlucky bards. The mere sense of spring makes much of his joy; the first division of his book is as full of pleasure in the skies and songs of May, as the earliest lays of the trouvères. His verses "dally with the innocence of love," and surely no Mimi Pinchon or Musette inspired these pretty lines:—

"Mais ma bien-aimée est la fleur des fleurs,
L'oiseau des oiseaux, la rêve des rêves,
Qui fait, dans le bois, palpiter les sèves,
Et fondre d'amour la rosée en pleurs.
Et ma bien-aimée embellit les choses;
Sa voix fait plus doux les rossignols,
Et ses grands cheveux, légers et follets,
Ravivent encor le parfum des roses.
Et quand, à travers les feuilles, je vois
La blonde aux yeux bleus, en claire toilette,
Simple et douce, ainsi qu'une violette,
Je crois voir passer l'âme des grands bois."

This is a fair specimen of the idyllic love songs, full of youth and the sense of the

spring, which are perhaps M. Bouchor's best claim to be a new and real poet. His *Variations sur quelques Avis de Shakespeare* do credit to his taste, which is indeed very much inclined to the study of English poetry. He even goes so far as to like tea and Tennyson, in which he probably differs from the romantic youths who took up Shakespeare in 1830. About Italian literature he confesses himself to be *un préjugé*, thinking perhaps that Petrarch is the only poet of Italy, and that Petrarch is too much in the manner of the detested *Parnassiens*.

All this is interesting enough, but it is not particularly joyous, and indeed his joyousness is the enigma, perhaps the weak point, of M. Bouchor's volume. Is he really so fond of pale ale, or does he only say so to annoy his ethereal opponents. What is the meaning of his vinous pantheism—

"La terre tourne, le grand ciel
Tourne; tout tourne, tourne! Au diable,
Je veux crever ma poche à fiel,
Et déclarer tout admirable.
O ciel, ô terre, ô grande mer,
Ivresse éternelle des choses!
Je confonds, n'y voyant plus clair,
Les gouttes de vin et les roses."

The *Chœur de Buveurs en Hiver* is a capital drinking song, full of noise not unharmonious. But a drinking song is one thing, and a philosophy of drink another. M. Bouchor is as frequent in his praise of wine as Omar Khayyam, and apparently with no more sincerity. It is a pity if he has reached the oracle of the Bouteille so soon, and found that the response is *TRING*. But after all his oracle is not absinthe, nor ha'chich—and probably he only insists on being jolly from a natural hatred of the poets in white vellum. His verses have a musical ring and plenty of vigour; his other qualities are probably best to be appreciated by his contemporaries. On the whole, we think it would be premature to send a special mission to congratulate France on her youngest singer. A. LANG.

Commissioni di Rinaldo degli Albizzi per il Comune di Firenze, dal 1399 al 1433. (Firenze: tip. Cellini, 1867-1873.)

AN impression long prevailed, mainly fostered by Roscoe's *Life of Lorenzo the Magnificent*, that the so-called Renaissance in literature and science was chiefly owing to the influence of the Medici. We know better now. Italy has thrown open her archives with a liberality equalled by few other countries, and the authentic materials for history which they contain have been published with a profusion which almost creates an *embarras de richesses*. Among these the three volumes which we now notice have appeared in a series of *Documenti di Storia Italiana*, issued by the Tuscan Deputazione di Storia Patria. The years to which they relate (1399-1433) fill almost the whole of the half-century of aristocratic government at Florence that was put an end to by the bloodless but decisive revolution which, in 1434, raised Cosimo de' Medici to almost uncontrolled power as the head of the popular party.

During the greater part of the fourteenth century Florence had been agitated by the factions of a new burgher aristocracy risen

from the loom and the bank. In 1373 the mob, hitherto excluded from political power, seized upon the government, and exercised power in a way which reminds us of the Commune of 1871. After three years of anarchy, the party which had been dispossessed regained its authority, and established a government the most successful and glorious which Florence ever knew. It was then that the city rose to the first rank among Italian States, and bridled the ambition alike of the Visconti of Milan and of King Ladislas of Naples. Nearer home, Pisa was subdued, Cortona and Leghorn were acquired by purchase. Great and splendid public works attested the vigour of the Commonwealth. Before that half-century reached its close, Brunellesco had completed the dome of the cathedral, and commenced the churches of San Lorenzo and Santo Spirito. Ghiberti, too, had finished one of the wonderful gates of the Baptistery, and was at work upon a second; whilst Donatello had breathed life into not a few of the productions of his chisel, and Masaccio had taught the painters of the world to take Nature for their master in gesture and expression.

This is the epoch on which the papers of Rinaldo degli Albizzi throw new light. They bring before us the life of an influential citizen, busied in the public affairs of a thriving commonwealth, as no biographer could delineate it. He was the last head of the family and the party by which Florence was governed during the half-century. Originally sprung from Arezzo, his family rose with the class of wealthy citizens which at the end of the thirteenth century had got the better of the ancient nobility, and which, through the institution of the guilds (*arti*), became masters of the State. Born in 1370, he was eight years old when the revolution which overthrew the rule of this burgher aristocracy for a time sent its leader, his grandfather Piero, to the block. As a boy he witnessed the revival of the authority of his father Maso (Thomas), who exercised undisputed power till his death in 1417.

At the mature age of forty-seven, Rinaldo succeeded his father in the direction of the Commonwealth. He had already filled all those offices which had now become almost hereditary in the family of an influential citizen. For the machinery of government was extremely complicated, and the short tenure of the innumerable offices demanded the co-operation of all the members of the dominant class. Except when these officials were called away from home, as ambassadors for instance, or as commissioners with the army, their services were gratuitous. Yet these gratuitous offices were eagerly sought on account of the influence which they gave; and those who could not be relied on by the ruling party were excluded from them by various contrivances sanctioned by the letter of the law, even if they were opposed to the spirit of the constitution.

Never was any citizen more frequently employed than Rinaldo degli Albizzi. We meet him everywhere, even in commissions of subordinate importance. For in those days such second-rate employments were no more despised by a statesman than the carving of doorposts or the painting of pieces of furniture was despised by a great

artist. From 1399 to 1433 Rinaldo was more than fifty times absent from home on mission to the various states of Italy, or even to the Emperor himself. In war he had commissions to look after the army. In peace he had various employments in Florentine or foreign towns. Finally, Pope Eugenius IV. conferred upon him, in 1432, the dignity of Senator of Rome. He was entrusted with the most important affairs. In 1418 he was sent to Pope Martin V., then on his way from the Council of Constance, with instructions to urge upon him the convocation of a new Council to complete the reforms left unfinished at Constance. In 1420 he accompanied the same Pontiff from Florence to Rome, and he was afterwards employed in Naples in pacifying the contending factions of that State. When Filippo Maria Visconti attempted to extend his authority over central Italy, Rinaldo's influence was used to separate the Pope from the Milanese alliance, to retain the friendship of Venice, to arm the rulers of Romagna, to place the fortifications of the Apennines in a state of defence, and to plead at Vienna and Buda with the Emperor Sigismund for a settlement of all questions at issue between him and the Venetians, in order that the Republic might be at liberty to turn its full attention to the affairs of Italy. From 1427 to 1430 he remained chiefly at home, intent upon a new system of taxation known by that name of *Catasto* which has since been generally adopted, and which rose out of the financial necessities of the State. In 1430 he was named commissioner for the war against Lucca, a war which he had eagerly promoted, and which, by its failure, paved the way for the overthrow of himself and his party by Cosimo de' Medici. Rinaldo's last commission was an embassy to the Emperor Sigismund in 1433.

All this while, from 1423 to the close of his public career, Rinaldo, with the minute exactitude characteristic of the Florentines, was keeping a daily record of the events of his life. For its publication we are indebted to the Cav. Cesare Guasti, at present head of the Florentine archives. He has done his work admirably. The text is carefully edited, and each embassy or commission is introduced by an introduction, including numerous documents either *in extenso* or abridged. There is also an index of no less than 160 closely printed pages to guide us through the labyrinth. The conscientious accuracy of the editor is only equalled by that of the statesman whose work he has illustrated.

It is needless to say that this book is full of information on the policy of the Popes and of the Italian States. Nor is it only of public affairs that they treat. Rinaldo tells us that in 1406 he bought at Arezzo a copy of the Bible for eleven florins (ducats). In the list of his expenses he notes even the soldi paid for barges in passing the rivers. Travelling was neither easy nor expeditious. From Florence to Bologna was a journey of two days and a half. In 1421 Rinaldo took seven days in going from Florence to Rome, and it required sixteen to reach Vienna from Venice, by way of Pontebba. Sometimes the names of places in Germany are hardly

to be recognised, and it is a pity that the editor should not have cleared up these difficulties for his readers.

Since the middle of the fourteenth century warfare had been in the hands of mercenary troops. At first these were composed of foreigners, latterly of Italians formed in the school of Alberigo di Barbiano. Under the Italian *condottieri* war became less savage than it had been in the days of captains like the German Werner von Urslingen, who was called the enemy of God and man. But the system was bad at the best, as the States were dependent upon the goodwill of the captains, who were absolute masters of their men, and were constantly changing sides. In the time of Rinaldo the system had reached its highest perfection under captains like Sforza Attendolo and Braccio da Montone. Yet even then what a want of confidence there was between the governments and their commanders, and how petty was the warfare itself, with its endless sieges of the meanest *bicoque*, and its fights bloodless to the soldiery, but entailing endless misery upon the populations. Several of Rinaldo's commissions have reference to military affairs, and the papers relating to the war with Lucca, which began in 1429, fill no less than 328 pages. The want of vigour in the commanders, the insubordination of the men, the disorder and want in the camp, the quarrels of the leading men, are equally conspicuous in this ill-conducted war. It proved ruinous to the reputation of the celebrated Brunellesco as a military engineer. He formed a plan for setting Lucca under water by obstructing the river Serchio by a dike. Unluckily for him, the water flowed into the camp of the besiegers instead of into the town.

Further on we learn that, in 1431, the Florentine forces consisted of 993 lances or heavy cavalry, and 3,740 foot under twenty-two captains. But these papers throw no light on the origin of the enmity between Rinaldo degli Albizzi and Cosimo de' Medici. Shortly before the outbreak of the war, both men appear in friendly intercourse. But we are still reduced for information to Cavalcanti, from whom Machiavelli derived his knowledge. Rinaldo, thwarted by decisions taken at home and by odious calumnies, threw up his commission when things began to look badly, but his position in the State appeared unchanged. As late as the beginning of 1433, he was sent as ambassador to Siena. Six months later the imprisonment and exile of Cosimo took place on September 7. But the records of the sittings of the Councils say nothing about Cosimo. The year was not over when his recall was talked about. In 1434 new political difficulties led to a rupture with Milan. The Florentines were defeated, and Rinaldo's popularity was at an end. On September 29 Cosimo returned, and his adversaries were banished. If these volumes furnish us with no account of these changes, they show how the ruling party lost ground through a change in public feeling. In a constitutional monarchy there would have been a change of ministry. In a State where real power was not with the legal representatives of government, but with a

party whose authority was not limited by any constitutional forms, the total downfall of that party was the natural result. Rinaldo spent the rest of his days in banishment.

"Messer Rinaldo," says Cavalcanti, "did not know fear. His hands were clean; he was well versed in science; he was steadfast, and a lover of justice so far as to be accused of harshness. He was simple in his manners of life, and hated profusion, whilst he used to say that temperance was necessary to health, which was interpreted by his adversaries as avarice. Had this man not been so haughty, his excellent qualities would have outshone those of many others. But his pride led him to underrate the virtues of others whilst it obscured his own merits."

Such a man was not likely to submit willingly to his fate, and, like so many other exiles, he fell into the error of trusting to foreign arms for his restoration. In 1440 he was branded as a rebel and a traitor, and, seeing that his hopes were at an end, he went on a pilgrimage to the Holy Sepulchre, and died at Ancona in 1442, not long after his return, in the seventy-second year of his age.

Rinaldo was no match for Cosimo. Cosimo was secret, cautious, and crafty, inclined to let others appear in the direction of affairs. Rinaldo was open, impatient, and impetuous. But the Medici owed their prosperity as much to good fortune as to their own abilities. In more than one instance they reaped where others had sown. The government of the Albizzi raised Florence to the height of intellectual and political pre-eminence, and laid the foundations for the rule of Cosimo and Lorenzo de' Medici, just as in later times Julius II. prepared the way for the splendid epoch which bears the name of Leo X.

ALFRED DE REUMONT.

Leicester Square: its Associations and its Worthies. By Tom Taylor. With a Sketch of Hunter's Scientific Character and Works, by Richard Owen, F.R.S. (London: Bickers & Son, 1874.)

THE inhabitants of London have reason to be proud of their parks and squares, where they can occasionally turn their eyes from dusty bricks to refresh them with the sight of trees and grass. Napoleon III. thought so when he introduced the London square into Paris, and now Baron Albert Grant presents us with a Parisian adaptation of the original English idea. It is not, perhaps, inappropriate that the French quarter of London should have a slice of Paris set down in its midst. Although we miss the noble trees that once adorned it, the square is now for the first time within living memory an ornament instead of a disgrace to the metropolis, and the supply of seats among flower-beds is a boon for which all tired Londoners should be thankful to the munificent donor, and to the Defence Committee, whose prompt action prevented the enclosure from being built upon. The busts of the four great men which adorn the corners of the square are well selected, and it shows the great interest of the neighbourhood that such representative men as Newton, Hogarth, Reynolds, and Hunter could be chosen for the purpose. As to the central figure, we

must consider it out of place. It would be well to have a statue of Shakspeare on Bank-side or at Blackfriars, but we think that here a representation of "glorious John" Dryden would have been more appropriate, as he lived close by in Gerard Street, and called himself, in the dedication of his *Don Sebastian* to the Earl of Leicester, "a poor inhabitant of his lordship's suburbs, whose best prospect is on the garden of Leicester House."

It is to commemorate this formation of "a pleasure ground for the people" out of a waste that Mr. Tom Taylor has written his interesting history of the past and present condition of the square. Taken as a whole, the biographical largely preponderates over the topographical element in the book; but this is not greatly to be regretted, as it allows the author room for a full and lively account of the various artists, philosophers and statesmen who were either inhabitants or lodgers in the square. It is true that much of the doings of these worthies has very little local interest. Leicester House furnishes a long list of distinguished people, for there lived the numerous members of the noble house of Sidney; the unfortunate Elizabeth, Queen of Bohemia and daughter of our James I., who was called by her husband's enemies the "Snow Queen," and by all the rest of the world the "Queen of Hearts;" the ugly but popular Prince Eugène, and sundry Princes of Wales. Savile House sheltered Peter the Great when he came to see our dockyards, and got royally drunk with our wine and brandy mixed with pepper. Other houses supply the names of Swift, who lodged in the square in 1712; John Hunter and Sir Charles Bell, Hogarth at the Golden Head, and Reynolds at No. 47. On the doorstep of this house the great painter found one morning a little ragged urchin, whose portrait is now familiar to all in the exquisite picture of *Puck*. Thomas Lawrence might have been added to the list of residents, as he came here on his arrival in London with the hope of enticing some of Reynolds's sitters away from him; but this ill-advised rivalry continued only for a short time, and Lawrence soon left the square. Had Mr. Taylor not confined himself exclusively to the houses in the square, but included some of the immediately surrounding streets, as he does in the single case of Newton, he might have added to the number of his worthies. To instance but two out of many, Opie the painter lived in Orange Court, and Woollett, the greatest of English engravers, in Green Street.

The plates that illustrate this book enable us to picture the successive states of Leicester Fields. First, there is Agas's map of London in the latter end of Elizabeth's reign, in which we see the lammas land, that was even then a subject of contention, used as a bleaching ground for the laundresses of London, and divided from other fields by hedges which mark the streets still known as St. Martin's Lane, and that formerly called Hedge Lane. There was then no sign of a house between the cluster of buildings connected with the Royal Mews at Charing Cross, and the little village of St. Giles's in the Fields. In 1630, preparations were being made for the building of Leicester

House, and the Earl of Leicester was allowed to take in a portion of the common on payment of 3*l.* per annum to the parish. A way across the fields, however, was to be left open for the inhabitants, and they were to be allowed space to dry their clothes upon. In 1637, workmen were engaged in finishing the upper rooms of the house. Faithorne's map (1658), shows Leicester House, and Newport House to the east of it, but the fields still remain. It would seem, if this map is to be depended upon, that old Leicester House stood about the centre of the present square, and this supposition was corroborated during the late alterations by the discovery of extensive foundations there. In 1671 the buildings on the south side were finished, and before the end of the century the ground in the centre was railed in. When new Leicester House was built on the north side is not known. Garden squares sprang up in London about 150 years ago. Previously the open spaces were carelessly kept, and became the dust-heaps of their respective neighbourhoods. St. James's square was beautified in 1727, and Leicester Fields were laid out about the same time. It was probably between 1720 and 1730 that Sutton Nichols's view of the newly planned square was published. A copy of this does duty as a frontispiece to Mr. Taylor's book, but it is there incorrectly dated 1700. Among George III.'s maps in the British Museum there is an interesting MS. plan of the proposed alterations, in which the awkward shape of the square is shown, and where it is stated that "the trees round the bason will hide the irregularity of the grass plots which could not be made otherwise by reason of the irregular figure of the square." Mr. Taylor has for the first time given the correct date of the erection of the notorious effigy of George I., which has gone through more vicissitudes than have perhaps fallen to the lot of any other statue. It was in 1748, when the quarrel between George II. and Frederick Prince of Wales still raged, that the latter, glad to put an affront upon his father, co-operated with the other inhabitants of the square in buying the statue of his grandfather at the sale of Canons. On the Prince's birthday, November 19, the statue was uncovered, and for many years after the "golden horse and man" was one of the London sights.

In the seventeenth and eighteenth centuries the square was a dangerous place after dark, but it was probably not much worse than neighbouring parts, for few districts of London were then free from danger. About 1670, Ferdinand de Macedo, a Portuguese, while crossing the fields, was knocked down and robbed by three life-guardsmen; and in 1699 some roystering noblemen and captains, who had quarrelled at a tavern hard by, fought a duel in Leicester Fields. Mr. Taylor's description of the fight gives us a vivid notion of the darkness and desolation of the enclosure. Somewhat later, Smith, in his *Life of Nollekens*, describes the danger of that part of the road where the lofty row of elms stood on the east side of the square. When Leicester Fields became the abode of royalty, mobs were often collected there to see state ceremonials; one of the last of these was on October 26, 1760, when

George III. was proclaimed king before Savile House. Twenty years afterwards the Gordon rioters attacked this same house, which was then possessed by Sir George Savile, M.P., and stripped it of its valuable furniture, books, and pictures, which they burnt in the fields in front.

The central position of Leicester Square has made it a peculiar home of sights, from Lever's Museum of Natural History, which was a rival to the British Museum in popularity, to the man with his telescope, who is immortalised by Wordsworth. Sir Ashton Lever, who filled Leicester House with his curiosities, was a collector from his youth, and when he grew up he would sell (according to Mrs. Montagu) an acre of good land for an extraordinary fungus. The next popular exhibition of importance was Miss Linwood's gallery of pictures in needlework, which interested our forefathers for many years, and is still remembered by some now living. Mr. Taylor pays a warm tribute to the beauty of Burford's panoramas, which unfortunately are now no more; but the list of Holophusikons, Eidophusikons, &c., is too long a one to allow us to follow him in noticing all the shows of the square.

It is a striking instance of the stability of London property, that the Sidneys who gave the name of their title to Leicester Square continued their interest in it until near the close of the eighteenth century, when they sold the property to the first proprietor of the Tulk family for 90,000*l.*, to pay off the encumbrances on Penshurst, and it was to the representatives of this family that Baron Grant paid 13,000*l.* for their shares in the enclosure.

HENRY B. WHEATLEY.

My Life and what I Learnt in it. An Autobiography. By Giuseppe Maria Campanella. (London: Bentley & Son, 1874.)

THIS is an artless, rather than an ill-written book, but it is not one of those happy autobiographical rarities in which the absence of art results in the growth of a natural masterpiece. Some of the technical defects are no doubt owing to the difficulty of translating very simple thoughts into a foreign idiom, without attempting to enliven them with idiomatic turns, generally misplaced. The title of the book itself is a case in point: it endeavours to be popular and attractive, and succeeds in being the reverse of descriptive; for the story of the writer's life only begins to be told in any orderly detail with the entry upon his novitiate (date not given), and ceases altogether with the fall of Venice in 1849, while the conclusions to which the life may be supposed to point appear full-grown in the first chapters, and the processes by which they became evident to the writer's mind are nowhere described and only unconsciously indicated. The narrative is sufficiently interesting to make its unintentional shortcomings matter of regret. Signor Campanella by no means exaggerates the importance of what he has to tell, and is quite willing to tell it honestly; but we gather that he was without the composed self-consciousness that makes the absolutely accurate observer, while the lapse of time has deprived his recollections of the freshness

that enlivens any well-meaning witness's account of his own experience.

Signor Campanella was born in 1814 at Spinazzola, in the province of Bari. His father was a respected magistrate, who traced his descent from a brother of Tommaso Campanella; his mother, according to the autobiographer a person of "excellent intellect and capital good common sense," evidenced as to its extent by her courageously calling some preaching Jesuits, at one time very popular with the ladies of the neighbourhood, "those black fellows," though it proved insufficient to emancipate her from a share in those prejudices of her time and surroundings, according to which it was indispensable to the credit of a respectable family that where there were six sons three should be dedicated to the service of the Church. Giuseppe was one of the three sacrificed. His education was at first conducted under the auspices of an uncle, a student who had adopted the monastic life as a protection against ecclesiastical police spies, but was afterwards abandoned to some illiterate Capucins, much addicted to the use of an instrument of torture resembling the "tawse" of Protestant Scotland. It is characteristic of our author that his memory of their ignorance and bigotry is enlivened, if not embittered, by the association of these qualities with the painful extra-theological experience. This is, in fact, the only point of real psychological interest in the autobiography; the jealous tyranny of the Roman hierarchy and the demoralising effect of its oppression upon all concerned, especially upon the lower orders of the clergy, who had virtually to choose between alternatives which comparatively few were acute or candid enough to see in their true light—the alternative of serving as hammer, or as anvil—these elements in the story are brought out very clearly and effectively, not indeed by the author's trite moral reflections and bits of Exeter Hall declamation, but by the picture of a practically despotic, all-controlling power, habitually at variance with the energetic impulses of its more robust subjects, and, by its material ascendancy, compelling their revolt to an unpractical concentration in feelings of indignation. When the victim of some particular piece of oppression has no other outlet for his indignation than by intensifying his sentiment of hatred against the oppressor, his rational dissent from the tyrant's principles is apt to lose its speculative breadth and temperance; a power that wishes its opponents to keep their temper and be quite reasonable must not be too strong, and, if the fact had not been known before, Signor Campanella's autobiography would have sufficed to prove that half a century ago the Papacy was still as much too strong for its spiritual subjects as it was for the author of the *City of the Sun*.

The work opens with a pretty sketch of the Spinazzola contadini at work and play, rather too much generalised, however, as if the writer was not aware of the interest felt in ancient customs, and especially in every surviving scrap of heathenish superstition. He makes the Church responsible for the poverty and ignorance of her faithful children, while giving her no credit for the

picturesqueness for which she is also in part answerable. Good village schools may teach some things more profitable than the traditional art of improvising pretty love-songs in dialect, but they are habitually fatal to the latter talent, whatever it may be worth; and if villagers are to enjoy two seasons of riotous festivity in the course of the year, it is perhaps an open question whether it is best for their morals to riot with less reserve because the spiritual powers are conceived to be tolerant of certain sins on certain occasions, or to risk their habitual piety of spirit by conceiving the powers in question as imposing impracticable anti-social restraints. Signor Campanella, while thinking it shocking that the boys and girls of the village should meet in church on Christmas Eve to flirt and pelt each other with sweetmeats, also resents the severity which condemned a young priest, his own brother, to a month of spiritual exercises in a convent as a penance for surreptitiously attending the Carnival in a mask. Don Giuseppe's novitiate was passed in a convent of mendicant friars at Banzi, and his account of the escapades of his superiors and fellow-novices bears all the marks of truth; and here again his conclusions seem more irrefragable than his arguments. There is something wrong in a system which imparts a flavour of sacrilege to harmless schoolboy mischief exactly in the case of those called to the most sacred offices: the only vessel available for cooking a dish of stolen macaroni was one in the sacristy containing holy water. For taking the lead in this exploit Campanella was condemned to public penance and expulsion; but his family persisting in their entreaties, he consented to be pardoned, and encouraged to make his public profession at once. Padre Luigi, as he is to be called for the next few years, is the possessor of a fine and powerful bass voice, and having studied under Francesco Stabile, his reputation as a singer spread through the province, and he was frequently summoned to assist at solemn musical services in other convents or churches. On one occasion some Americans, who were struck by his voice, sought an acquaintance, and gave him fifty dollars, and an invitation to make his fortune on the stage in their country. He was only dissuaded from the attempt by Stabile, who represented to him the difficulties of escaping to the coast and the fatal consequences of his arrest as a runaway priest with a forged passport. Immediately afterwards he was summoned to Rome "to compete for the primo-basso at the Sistine Chapel." On the way he was twice threatened with arrest by an omniscient police, for going to the opera, and not staying at the convent of his order, but was promptly released on the offer of one or two scudi. The description of the solemn musical examination of the candidate is curious and interesting. Padre Luigi was elected, and for a time lived contentedly at Rome, the vow of poverty not being supposed to interfere with well-paid engagements to sing in different churches, until his relations with the Liberal party became suspicious; then he was forbidden to sing on his own account, and soon afterwards was ordered to leave Rome for Naples, his appointment at the Sistine Chapel being vir-

tually revoked without appeal. There was of course no remedy, and the same kind of mild persecution—of the patriot through the *virtuoso*—being continued at Naples, he resolved upon procuring his secularisation as a step towards greater liberty, to be used in moral and revolutionary propagandism. By 1848 he had become well known to the Liberals of Naples, and his voice, silenced in the churches, found ample employment in the streets, in drowning cries that threatened "Death to" anybody in particular, and substituting the more harmless "Away with," or else an edifying "Viva!" Campanella accompanied the Neapolitan volunteers who started for Lombardy with the small contingent sent by Ferdinand II., and then recalled. The volunteers went on to Venice and joined in the defence: the slight sketch of the tragical interval ending with the capitulation is enlivened by a serio-comic picture of the *ex-basso profundo* preaching at the top of his voice to the Austrian outposts on the sins of tyranny, and once seizing the opportunity to hurl quite Homeric defiance and denunciation at Radetsky in person.

EDITH SIMCOX.

The Scottish War of Independence: its Antecedents and Consequences. By William Burns. (Glasgow: James Maclehose, 1874.)

THIS is a polemical but vigorous account of the war which created modern Scotland. Not content with accepting Mr. Freeman's rash challenge on the old question of the Scotch vassalage prior to Edward I.'s conquest, and doing battle with the over-praised author of *The Greatest of the Plantagenets* on behalf of Wallace and Bruce, both of which topics fairly belong to his subject, Mr. Burns' combativeness has led him to rush into the Pictish controversies, and fight Mr. Skene on the relation between the Picts and the Scots, and Mr. Burton on that between the Scots and the Anglo-Danish population of Lothian. His book would have been better had he confined it to the history of the War of Independence. He doubtless succeeds in pointing out—what any reader of the Prefaces to the Chronicles of the Picts and Scots and the new edition of Fordun could do—the risk of error in constructing a history of Scotland in the seventh, eighth, and ninth centuries from such materials as the brief entries in the Pictish Chronicle and the Irish Annals, the earliest of which was compiled not earlier than the end of the tenth century; and the conjectural character of some of Mr. Skene's results, such as his reconstruction of the lists of kings of the Picts, and of the Scots of Dalriada, and the supposed conquest of Dalriada by the Picts in 736. But sufficient respect is not paid to the labours of a writer who has collected once for all the Celtic sources, which though, like the Scandinavian, neglected by too many historians, yet form the necessary basis of early Scotch history, and has reintroduced a critical spirit and exact scholarship into this dark period.

On the question of the vassalage, Mr. Burns follows Mr. E. W. Robertson, whose reading of the authorities, though it cannot be supported on every point, is more correct

in its general result than that of Freeman, as any one may see who tests the statements of both authors by the Saxon Chronicle itself. Mr. Burns seems unaware that a more judicious school of English historians—Hallam, Kemble, Pearson, Stubbs—have never adopted the positions of partisan writers like Palgrave and Freeman. In opposing what, adopting an unhappy phrase of Robertson, he calls the theory of displacement, Mr. Burns mistakes the view of Burton and other writers in a way which seriously affects the value of his own work. It has never been supposed that the Celtic population of Scotland disappeared except from Lothian, where scarcely a single Celtic name has survived south of the Lammermoors. No other district is without them, and even now Gaelic is spoken over more than half Scotland. What cannot be gainsaid is that although the kings of Scotia derived their most ancient titles from the monarchs of the two Celtic races, yet at least after Malcolm Canmore married Margaret in 1070, the Anglo-Danish Lothian, permanently united to Scotland by the victory of Carham in 1018, if not earlier, became the centre of the kingdom, the Teutonic language dominant, and Teutonic institutions the basis of those to which all Scotland by degrees submitted, so that now it is with difficulty that a few traces of Celtic customs (never as in Wales and Ireland reduced to written laws, or, with scanty exceptions, embodied in written chronicles) can be discovered. Hence Mr. Burns has failed to see, what Mr. Murray in his admirable work on the Southern Dialect of Scotland truly points out, that the War of Independence, although it created the Scottish nationality of after times, was in its essence the struggle of the last surviving bit of Anglo-Saxonism to preserve its freedom from the Norman yoke. As regards the war itself, Mr. Burns has studied the original authorities with diligence, but too often interrupts his narrative to quote or controvert modern historians. He brings out with clearness that Edward's attempt to incorporate the northern part of the island in a British empire was a new thing. The short-lived supremacy of Athelstane, of Canute and of William the Conqueror was wholly different. The treaty of Falaise was surrendered by Richard I. Edward himself had formally renounced, by the treaty of Brigham, the claims he afterwards asserted. This king is certainly entitled to be called, as regards England, "the greatest of the Plantagenets," but as regards Scotland he was what he described himself on his tomb, "Malleus Scotorum." Mr. Burns has also well contrasted the Scotch leaders of the earlier and later period of the war: Wallace, who fought for liberty; Bruce, who fought for a crown as well. The concluding chapter, which treats of the results of the War of Independence, though in some points overdrawn, ought to be perused by those who idly regret that Scotland was not united to England in the thirteenth century, as well as by politicians who favour now a centralising policy. It is pleasant to direct attention to the fact that this solid work proceeds from the Glasgow press, which has hitherto done too little for historical studies.

Æ. J. G. MACKAY.

Hampton and its Students. By Two of its Teachers. (New York: S. P. Putnam's Sons, 1874.)

THE four millions of coloured people who have been suddenly put on political equality with the Americans will long continue to furnish one of the most perplexing problems of the States. Education seems the only possible way of solving it, and how far the negro race is capable of being educated remains to be proved. The writers of this report of Hampton and its Students maintain that the effort has been made among a limited number with success, and they write in "the strong faith that the future of this long-enduring race will yet redeem its past."

A Normal School for the Freed Slaves was founded in 1861 at Hampton, Virginia. "During the term of 1873-4 the number of students enrolled was 226, who for the academic course were divided among twelve teachers, most of them trained graduates of the best Northern schools." The normal course includes language, mathematics, history, natural science, moral science, principles of business, &c.; there are also agricultural, commercial, and mechanical courses:—

"One of the fundamental principles of the school is that nothing should be given which can be earned or in any way supplied by the pupil, and in consonance with this principle, regular personal expenses for board, &c., rated at ten dollars a month, are thrown upon each student, to be paid by them half in cash, and half in labour."

The object is one which enlists equal sympathy from the North and South, and both have given largely for its support—but funds are needed to increase the building, and in the consciousness of a good cause, the writers appeal to the public for help. "Last year," they say, "we had the sorrow of turning away from our doors many an applicant whose only hope lay with us, because our buildings were more than full." The negro boys have proved their earnest wish for education by sleeping out during the coldest weather under canvas in the precincts of the school.

The detailed working of the institution is carefully explained, and the report is written with enthusiasm, and considerable graphic power, rendering it far more amusing and interesting than it is thought right to make our English reports of charitable institutions.

Of the negroes' powers we hear that "they learn with average readiness, and show more than average perseverance, but find their chief difficulty in inability to assimilate the ideas which they receive." Some of the histories of the students are given in their own words, and it is easy to perceive this difficulty.

The sketches of the coloured folk living at Hampton are full of humour and pathos; the following is a dialogue extracted from one called "Incomplete Sanctification," in which a negro is stating his "experiences":—

"When you've got de glory in your soul, you can't help hollerin and a shoutin."

"Then as you have experienced religion, Mr.

Jarvis, I suppose you have forgiven your old master, haven't you?"

"It was an unexpected blow. The glow died out of his face, and his head dropped. There was evidently a mental struggle. Then he straightened himself, his features set for an inevitable conclusion, 'Yes, sah! I'se forgub him, de Lord knows I'se forgub him, but'—and his eye kindled as the human nature burst forth; 'but I'd gib my oder leg to meet him in battle!'"

An old negro woman relates how her fourteen children had been sold away from her, and what her feelings were, when, at the time of the war, she saw the Union flag hanging across the street, a sign that deliverance was at hand:—

"An den I spreads out my two arms wide—so—an I hugs dat ole flag up to my bress—so—an I kisses it, an I kisses it, an I says, 'Oh! bress you, bress you, bress you! Oh! why didn't you come sooner an' save jes one ob my chillen!' an' den de Yankees come a marchin' up de street wid de band a playin', an' de people a shoutin', and I was cryin' so I couldn't see nuffin, tell all at once I membered what my ole missis tell me, an' I wiped my eyes, an' looked to see ef dey did hab horns for sartin."

But perhaps the most characteristic sketch is that of the coloured preacher, Father Parker. Negro ambition seems to have been fully satisfied when he headed the procession in Norfolk on the day when the Emancipation was proclaimed in 1863.

"I went and headed dem coloured people, a ridin' in dat yer carriage, a settin' back on dem yer cushions. An' I sot back—so—an' lifed up my eyes, an' seed de Union flag a wavin' an' a wavin' ober my head—so—an' de music a playin', an' de people a shoutin', an' I said, 'Oh, Lord! can dis be me? ol' Bill Parker, slave forty year—a settin' back in dis yer carriage, on dese yer cushions, wid de ol' flag a flyin' ober my head, a ridin' along at de head ob dis percession of free men?' An' I sot back!"

The latter part of the book is filled with cabin and plantation songs, some of which are sung by a band of Hampton students, called the Jubilee Singers, who are sent about to give concerts in aid of the funds of the school. The songs are most of them curious, and to our English ears somewhat ludicrous. The negro melody is occasionally very sweet; the negro theology is decidedly grotesque; this is an average specimen of the camp-meeting hymn:—

"O saints and sinners will you go?

See de hebbently land—

I'm gwine up to heaven for to see my robe.

Gwine to see my robe and try it on;

It's brighter dan dat glitterin' sun.

I'm a gwine to keep a climbin' high

Till I meet dem angels in de sky,

Dem pooty angels I shall see;

Why don't de debbel let me be?

I tell you what I like de best—

It is dem shoutin' Methodless.

We shout so loud de debbel look

And he gets away wid his clooven foot.

See de hebbently land."

Whatever is essentially good in the negro music will probably live, and may be reproduced in the music of the future, but we cannot be surprised that "the negroes themselves despise these songs, as a vestige of slavery."

F. M. OWEN.

NEW NOVELS.

Holding Fast and Letting Go. By Brudie Brudie. (London: Simpkin & Marshall, 1874.)

Mary Grainger. By George Leigh. (London: Samuel Tinsley, 1874.)

Wandering Fires. By Mrs. M. C. Despard. (London: Samuel Tinsley, 1874.)

MR., MRS., OR MISS BRUDIE BRUDIE (for the reduplication quite prevents the possibility of discerning this author's sex or condition) has written a novel which in hot weather may be productive of innocent pastime. It is true that it is not possible to take the slightest interest in the story, and that the characters are uniformly silly; but the language of the book is a decidedly curious survival of the Laura Matilda class and period, and the names of the personages are delightful and ennobling to read. Violet Vivien, Lionel Harcourt, Stanley Wyldish, Inah Dallingcourt, and many more, form a group which the truly aristocratic taste, weary of Brown and Jones, cannot too much admire. The style, too, in which these personages talk and are talked of, is very soothing. Mr. Micawber educated under the personal superintendence of Miss Pinkerton could scarcely surpass it. "I shall continue my teaching" says a young lady to a young gentleman "with the admonition, that the excitement of gambling must not be resorted to as an antidote, after such an effort of self-denial as you have just described." Shortly afterwards the lady "engages herself in rendering more secure the fastening of one of her ornaments." She wears a widow's cap—"her hair was still partially concealed by a soft white covering," and so forth. We should recommend to Miss Brudie—if Miss she be—the study of the *mot propre*. When she next writes a novel, let her go sternly through it chapter by chapter, and turn every agricultural implement into a spade: after this process she may be readable. This is the story. Violet Vivien is a young widow with a child and an embarrassed property, which her husband's friend Stanley Wyldish is trying to nurse for her. He is a better steward to her than to himself, and gets into a complicated scrape of gambling and flirtation with the Dallingcourts, brother and sister. But of course it all comes right and Wyldish marries Violet, or at least is about to do so when the book closes. There is a modified villain who tries to spoil the match. This is Major Harcourt, a foolish and unskilful villain, who finding himself quite unprovided by nature with the brains required for villainy, very wisely repents. He has married a wife who does not love him until she finds that he loves somebody else. Then she begins to love him very much. We have much pleasure in recommending this expedient to all Benedicts who are dissatisfied with the amount of affection they obtain from their wives. But we should not like to guarantee invariable success.

Very much the same moral is illustrated in *Mary Grainger*. John Brown, the son of a rich manufacturer, having taken orders and married early, is established by his father in his own immediate neighbourhood as a sort of squarson with a large income

and nothing to do. Starting with a good deal of enthusiasm for his wife and his profession, he gradually gets disgusted with both—with his profession because he does no real work in it, and with his wife because she cares for nothing but endless gaieties. At last, when idleness, fulness of bread and disgust have brought him into a thoroughly unwholesome and tindery condition, he meets Mary Grainger, a girl who is in a somewhat similar state of mind from very different causes. She is the daughter of an army tailor and moneylender, who has brought himself and his family to ruin by gambling, drink, and general slipperiness. Brown and Mary fall in love with each other almost at first sight, and after certain adventures clope together, and live in a sort of bower of bliss at Torquay, as Mr. and Mrs. Radcliffe, Brown having first made a disposition of his property, by which he gives the bulk of it to his wife absolutely, settles ten thousand pounds on Mary, and leaves himself nothing. The pair of course discover that they are not quite such a heaven-made couple as they thought, and after not a few vicissitudes they part, Brown finally returning to his wife, who has been sobered by the shock of his leaving her, and kills many fatted calves for his return; and Mary meeting on Westminster Bridge a wildly improbable Earl of Belhaven, who instals her in his house (on a strictly proper footing), and leaves her two thousand a year, which she devotes to good works. The story into which Mr. Leigh has worked up these materials, is with very many faults and shortcomings a story of remarkable power and interest, especially in the portraiture of Brown. The effect of accidental luxury and culture on a somewhat ordinary nature, exciting rather than developing the intellectual faculties, and disorganising the moral, is admirably rendered, and the commonness of the type nowadays gives it additional interest. There are strokes of unusual power in the description of Brown's alternate attraction to and revulsion from Mary, and of his positive fear of discovering that his wife's affection for him does exist, after he has made up his mind that it does not. If Mr. Leigh will work patiently, and not trouble his head with moral theories (to which from his preface he seems a little addicted), he ought to do well. His book has many of the characteristics of the early work of a novelist of talent, possibly of genius.

It is, we think, a very short time since Mrs. Despard's last (and first) novel appeared. Unless, therefore, this writer, according to the fable current of Victor Hugo, keeps supplies of novels ready written, to be issued at such times as may please her, we may mourn an addition to the list of quarterly novelists. An optimist reviewer might perhaps congratulate himself on having got the reading of *Wandering Fires* over, instead of having it to come. Although apparently written with some care, it is terribly wearisome and uninteresting. Mrs. Despard has not succeeded in clothing with any fresh interest our ancient friends, the beneficent middle-aged authoress, the pompous clergyman who bullies his wife, humbugs his congregation,

and likes his dinner; the fiendish golden-haired governess who disturbs the peace of families; the wily foreigner who speaks all languages, has unholy ideas on the subject of matrimony, and keeps a gang of cut-throats on the shore of the Aegean so as to be handy when wanted. All these personages are put through violent exercise; but whether they start up in bed, writhe in agony, or drink "old port," at odd times in the middle of the day; whether they endeavour to murder each other, go through perfectly unintelligible scenes in bedrooms (vol. ii. p. 160), or retire to lunatic asylums (the only one of their proceedings which has merit of congruity), they are always tedious and uninteresting to the last degree. It is a pity that so much labour should have been spent to so little purpose.

GEORGE SAINTSBURY.

CURRENT LITERATURE.

Wayside Notes in Scandinavia. Norway, Denmark, Sweden. By Mark Antony Lower, M.A., F.S.A., &c. (London: Henry S. King & Co.) Mr. Lower, who does not even profess to know any Scandinavian language, went by sea last summer to Copenhagen, and, being unwell, returned by sea to London in the course of a week or two. Into Sweden he allows he did not go, and, in spite of some very sly passages, we can safely assert he has never looked on Norway. His knowledge of Scandinavia is absolutely confined to a short stay with English people in Copenhagen and its environs. Mr. Lower, however, has described, vaguely but at some length, both Bergen and Christiania. In each description there is only one expression that is not obviously taken out of a book. In his account of Bergen, however, he says, "The inns of Bergen cannot be commended, as they are neither comfortable nor cheap." This staggered us; it seems so very like original observation. But, turning to Murray's *Guide to Norway*, we found this sentence: "Inns—not well kept, and dear." In Mr. Lower's description of Christiania occurs this passage: "A curious octagonal church of brick. . . . It looks more like a chapter-house than a church. It is covered by an immense dome of brick, and even the groining ribs are of the same material." Murray's *Guide* says: "This is a very large octagon . . . covered with brick. . . . This octagon is covered by a brick dome, resembling the roof of some of our best chapter-houses. . . . All the groin ribs and arches are of brick." Mr. Lower has not been to Norway, yet he pretends to describe its towns. This is very disingenuous!

This book is absolutely worthless, except as a work of humour. Judged as a funny production, it has its interest, but as a serious piece of writing it is of that class, now happily rare, where nothing that is new is true, and nothing that is true is new. Being entirely ignorant of the Danish language, Mr. Lower has been forced to compile his book from Murray's *Guide to Denmark*, and Professor Engelhardt's *Guide Illustré*. Paraphrases from these two works occupy about four-fifths of the volume. When Mr. Lower quotes a name not found in these books, he almost invariably spells it wrong. He writes "Frederits" for "Fredericia," "Fredericksal" for "Frederiksdal," "Jorsalalar" for "Jorsalfar," "Breum" for "Byrum," and plenty no less monstrous. He sees "a pretty shop for what the Danes call *tobakker*," and tells us that they call a bookseller *bog-handel*, which really means a book-shop. He ekes out his remarks with no less than 42 (out of 277) pages of totally irrelevant matter from a lady's MS. translation of Jonas Lie's *Den Fremsynkte*.

But a few sentences culled at random will give the best idea of Mr. Lower's style and sentiments:—

"I will never acknowledge William as an Emperor, nor Bismarck as a Prince, for neither of them has a rightful claim to such a title."

"After a few hours in the North Sea we saw the most glorious sunset that eye could rest on, and I distinctly saw a portrait of the head of my little Chinese dog, 'Ching.' Even Turner in his wildest imaginings could never have touched that scene."

"In 1814 Denmark was compelled to cede Norway to Sweden, but why I never could understand."

"The Danes call their great national meetings 'things,' and so I think they are" (sic).

"Most of our manufactured articles are the result of what people call accidents; but I believe that they were given to us by the Providence of Almighty God. Take glass for instance."

"This sculpture is no doubt emblematical of something."

"It is perhaps too much a fault of mine to digress; but when in a writing humour I cannot help myself."

"The isle of Zealand, which impinges on Copenhagen (!) is variously spelt . . . and the New Zealand of the southern hemisphere is named after it."

This last statement is exceedingly original.

Little Senlakin and other Poems. By E. Keary. (G. Bell and Sons.) The poem which gives its name to the volume is founded on the well-known legend, the counterpart of which Matthew Arnold has used for his "Forsaken Mermaid." Miss Keary adds nothing to her theme except perhaps quaint homely vivid detail; and her metre is formed on a corrupt following of "Goblin Market." "Snowbell," a more original treatment of the "Enchanted Maiden and the Seven Dwarfs," though the metre is even more ragged, would be pretty if it were not too incoherent. We want the author to supply the unity which the fantastic subject does not. Some dramatic lyrics like "Two" and "Theodora," would be moving if they did not presuppose too much. The most important thing in the volume is a correspondence between two friends, one of whom has turned Catholic and Carmelite, the other is inclined to turn Comtist and Communalist. It looks as if it were taken direct from life, and has all the clear-sightedness of emotional sincerity, though the metre is unusually aggravating. It turns upon the question whether it is selfish to be a nun or a Christian, and the Carmelite is allowed the last word with a vision suggesting that the religion of the Cross is still the highest expression of Welt-schmerz. Miss Keary is a very difficult author, partly through mere crudity, partly through a passion for experiments in search of metres favourable to directness: if she has force enough to accept the familiar conditions of art—she has not force enough to transcend them—she may yet make her mark.

Poems. By Meta Orred. (London: Smith, Elder & Co.) Miss Orred and Miss Keary would make a poetess between them. Miss Keary can think and feel and imagine: Miss Orred can write. Several classic things at the beginning are tolerable echoes of Tennyson's "Tithonus;" the most original thing is "The Dying Monk."

The Psychology of Scepticism and Phenomenalism. By James Andrews. (Glasgow: Maclehose.) This essay is one more attempt to escape from the extreme consequences of any concession to Berkeley's idealism. The writer objects to the theory of unconscious mental modifications, which followers of Hartley have been constrained to adopt, that an unconscious state is merely a state which exists, but is not known (to the subject?) as existing. Animals without a cerebrum, idiots in whom the cerebrum though present is functionless, are supposed to have sensible perceptions, but not consciousness, because they do not know them as really differentiated; while the truthfulness of the experience of the sane is verified by the correspondence of unconscious memory with conscious perception. The connexion between this view and the light thrown by physiology on the localisation of senses is discussed cursorily and without much method.

Contemporary English Psychology. Translated from the French of Th. Ribot. (London: King & Co.) We are late in noticing this text book, in which students will find a fairly candid and intelligent analysis of the opinions of Messrs. Spencer, Bain, Lewes, and the Mills, father and son, with a digression to Samuel Bailey and a few pages on Hartley. The fault of the volume considered as an introduction to the study of psychology is that the exposition of the individual views of these representative writers is not supplemented by a clear independent statement of such of their common principles as the author thinks of vital importance. The introduction is merely a recommendation on general grounds of the application of the "objective" method to mental science, and it is not free from inaccuracies of expression which might be accounted for by carelessness, but look at least as much like ignorance.

Cassy. By Hiesba Stretton (London: H. S. King & Co.). Hiesba Stretton's writing is always vigorous. She has a quick eye for the picturesque, and writes naturally and with feeling. The scene of *Cassy* is laid in Epping Forest, and the heroine is a little London waif, who runs away from a cruel father, and takes refuge with a misanthropic dwarf who lives in a caravan. The descriptions of the forest life, and of the situation which Cassy obtains at a shaving saloon in London are both graphic, but it seems rather a pity that the author should try by the aid of John Bunyan and the Apostles' Creed to solve all theological difficulties between these two pretty little blue covers. It is impossible to think that Simon the dwarf gave an entirely conclusive reply to Cassy's question in regard to the dogmas of Christianity; but it was wisely done to show that in his love and care of the stray child, he made his nearest approach to a knowledge of the Divine.

Alice de Burgh: a Home Story for Girls. (London: Virtue & Co.) This is probably the work of a very young writer, who may be deluded by the pretty binding and charming type in which Messrs. Virtue have got up her book, into thinking that she has "a turn" for authorship. She ought to have torn up *Alice de Burgh*, and, possibly, two or three other efforts which might have followed it.

The composition is of the thinnest kind; the story is harmless, what there is of it, and the incidents are good, and might have made an interesting tale but for the exceeding triteness of the writing. The good intention of the book is undeniable, as may be seen in the following sentence, but it is a pity that good intentions will not teach grammar:—

"Margaret had yet to learn that the first object of interest to her ought to be her home duties; and that learning, although well enough in itself and when God has given the talents it is right to make use of them, still it was not right to make learning her only aim in life, and it was more wrong still to put it forward as a reason for neglecting to study and practise all that is needed to make those around her happy, so that in the future she might know how to do those many little services and occupations which make a home look bright and happy, and which none but a woman's hand can rightly perform."

The illustrations are pretty, but they have nothing whatever to do with the story, and the most amusing thing about the book is the ingenious way in which they have been connected with it. EDITOR.

NOTES AND NEWS.

MESSRS. GEORGE ROUTLEDGE AND SONS and Mr. L. C. Gent promise us a new edition of Hogarth's Works, to be published in about thirty monthly parts, which will contain nearly seventy more plates than any former edition. The text will be based on that of Nichols and Ireland, but much new matter, biographical and anecdotal, illustrating many of the real characters delineated

by Hogarth, will be incorporated. There will also be a life of the artist, containing much new information. Mr. James Maidment is to be the editor.

THE reception of M. Alexandre Dumas at the French Academy is fixed for a day within the first fortnight of January next. The reception of MM. Mézières and Caro will follow; and after the last of these ceremonies the Academy will elect a successor to the chair of Jules Janin.

DR. R. PISCHEL's edition of Hemachandra's *Prakrit Grammar* will be published in two parts. The first will contain the text, the critical apparatus, a complete index of all words occurring in the grammar, and an alphabetical list of the sūtras of Vararuchi and Trivikrama. The second part will contain the commentary, with notes explanatory of the text, and examples from Prakrit works.

WE are glad to hear that four hundred of the 576 pages of text of the first volume of Mr. Arber's *Transcript of the Registers of the Stationers' Company* are printed off, and that the volume will probably be issued in October. About half the third volume of the *Paston Letters*, edited by Mr. James Gairdner, is also in type.

IN the Archives at Brussels are preserved several volumes of the correspondence between Juan de Necolalde, the Spanish minister at the Court of Charles I., and the Cardinal Infant. The first two volumes are especially interesting from the light they throw upon the secret agreement which was proposed between England and Spain for the use of the ship-money fleet, and upon the cause which led to the abandonment of that agreement, namely, the complete inability of Spain to find the sum of 50,000*l.*, which was to have been advanced to Charles. During this period, in fact, Charles had taken up his father's policy of expecting the recovery of the Palatinate from Spain, which he had combated so warmly in earlier life. Necolalde was far from being a man of Gondomar's abilities, but Charles seems to have been less difficult to manage than James, and in Portland, Cottington, and Windebank, the Spaniard had supporters who never failed him.

MANY readers will have heard with much regret of the death of Mr. Sydney Dobell, which took place last Saturday evening, at his house, Barton End, near Nailsworth, Gloucestershire. Ill health had for many years prevented him from pursuing with any steadiness or strenuousness the career of literature, and thus his name, which was made especially familiar twenty years ago by the publication of *The Roman* and of *Balder*, had dropped out of the common talk of literary society. Both these works commanded great attention from a large public, and the merits of both as works of literary art were somewhat fiercely fought over. We have lately been told that it is not the province of a work of art to excite the contest of different opinions, but rather to produce an harmonious pleasure. But the art of poetry, especially in its most original manifestations, has generally produced contest as well as delight. Nevertheless, there are certain minor poems of Mr. Sydney Dobell's about which contest of opinion is impossible. His weird, extraordinary ballad, *Keith of Ravelston*, with its significant refrain, is one of those little works which will live longer than most large ones. And some among the war poems, dealing with incidents of lowly life, strike a strong and deep chord, and express, as few things in modern literature express, the emotions of a people in war time, with the continual clashings of patriotism and of personal grief. Mr. Dobell was an intense patriot; very much a Conservative, but very much more an Englishman. Almost to the last he took the keenest interest in all that was passing in the world of politics and literature. He dies, prematurely, as a middle-aged man. This is hardly the place in which to speak of personal qualities which immediately commanded, in all who knew him, some feelings warmer than respect.

We have received *Anticriticism, or How Some one hit the nail on the head*. A friendly dialogue, by Professor H. Steinthal. ["Antikritik. Wie einer den Nagel auf den Kopf trifft. Ein freundschaftlicher Dialog."] (Berlin, 1874.) This pamphlet contains Professor Steinthal's reply to Mr. Whitney's strictures. It is a severe punishment inflicted by a German on an American scholar, such as has seldom, if ever, been known in our literary annals. For years it has been a matter of surprise to many people that Mr. Whitney should have been allowed to pursue his extraordinary course with impunity. He evidently imagined that the easiest means of gaining a reputation was to attack other scholars, and to challenge them to a pugilistic combat. He apparently did not understand why they shrank from an encounter with the American champion. He became more defiant and offensive with every year, and he has now at last obtained his heart's desire. We do not defend the tone which Professor Steinthal has adopted in his reply, though there seems to be but one opinion among unprejudiced persons, that the extraordinary behaviour of the young American scholar would have been an excuse for almost any reprisals. But however that may be, if Professor Steinthal thought that Mr. Whitney's proceedings, encouraged as they were in American and German newspapers by a few not quite disinterested writers, were doing real harm to the cause of that science to which he had devoted the whole of his life, we believe that he might have produced a much more salutary effect by showing his indignation in severe, but measured terms. Facts tell more than words. Professor Steinthal might have been satisfied with showing that Mr. Whitney had either not read his books, or, if he had, had not understood them. He might have complained of his misrepresentations, and exhibited the shallowness of his knowledge. But what is to be gained by mere abuse? On every page, as we read on, we meet with expressions such as, "the horrible humbug," "the vain man, who only wants to be named and praised," "the scolding flirt," "the tricky attorney," "the man who barks against the spirit of our classics in poetry, philosophy, and philology." What he writes, we are told, are empty bubbles, jesuitic insinuations, full of impudence, deserving a flagellation. A climax is reached in the following sentence: "Everywhere when I read him, hollow vacuity yawns in my face, arrogant vanity grins at me." Other words, such as *Tolpatsch*, *Geck*, *Lügner* must remain untranslated, and they certainly would much better have remained unwritten. When will scholars, and particularly students of language, learn that rude and offensive words do much less harm to those to whom they are addressed than to those out of whose mouths they proceed?

MR. J. F. SOLKINSON, an English subject residing in Hungary, has just published at Vienna his translation of Shakspeare's *Othello* into Hebrew, with a critical introduction by Mr. Peter Smolensky, the editor of the Hebrew periodical *Hasachar* (Aurora), at Vienna, and author of various Hebrew works. Mr. Solkinson was already favourably known by his translation of Milton's *Paradise Lost* into Hebrew; and his present version of *Othello* is very highly praised by Mr. Smolensky, who contends that it is the best translation of the play into any foreign language.

DR. ROBERT DAHLMANN, of Bonn, is to join Mr. Edmund Brock in editing *Cato* for the Early English Text Society, and is to contribute to the work an essay on the different versions of the famous Distichs of the Middle-Age philosopher, and their wide diffusion through the literatures of all the countries of Middle-Age Europe. To Mr. Brock's already prepared texts—two Anglo-Saxon, two Early-English, and one Old-French—Dr. Dahlmann will probably add a third and different Early-English version, and a second Old-French one, besides a Latin one, from the MSS.; and he will collate for each all the accessible manuscripts.

Dr. Dahlmann is a pupil of Dietz, Delius, Simrock, &c., and also a second-lieutenant in the Prussian army, in which he won his promotion during the late war.

THE Early English Text Society prize in the University of Mississippi, was won by Mr. Thomas Walter Stockard, of Torondos county, Mississippi, who got ninety-nine per cent. of the marks given for his paper. Honourable mention was also made of Mr. Wm. Addison Alexander, of Kosciusko, Mississippi, whose paper was less than one per cent. below that of Mr. Stockard.

THE small University of Jena seems to be bent on reviving the literary traditions which have given it so high a place in German literature. Not only has it set on foot an excellent Review of current learned literature, which proves a formidable rival to the *Centralblatt*, but it is on the point of starting a new organ of scientific theology in its widest sense, to which most of the leading liberal theologians of Germany and Holland have promised contributions. The title is to be *Jahrbücher für Protestantische Theologie*, and the editorship divided between Drs. Hase, Lipsius, Pfeleiderer, and Schrader, members of the theological faculty at Jena. Subscription price 5 thalers, or 15s., a year.

THE Russian Minister of Public Instruction has sent Dr. Harkavy and Dr. Stark to Tchufut-Kalé to examine the MSS. of the late M. Abraham Firkovitch, whose death we announced some weeks since, and to buy them for the State if they think proper. They are now said to number not less than 5,000.

It appears that there is a Society in Italy for the suppression of bad books, which in its fourth report expresses great indignation against the *Rivista Europea* for having said that too many of its members would exclude all books but the Catechism, the Office of the Madonna, or at most, the Book of Dreams. The *Rivista* naturally finds it hard to be called to account for what was a mere vivacious expression, not to be taken in a literal sense. From the conduct of the Society in this instance it is clear that the feminine element in the Italian character does not stop short of inability to distinguish between an illustration and an argument.

A VOLUME of notices and papers relative to the funeral obsequies of F. D. Guerrazzi has just appeared at Leghorn, the proceeds from the sale of which are to go towards the subscription for his monument.

THE new Director of the Archives at Milan is proceeding rapidly with his catalogues. Four-fifths of the documents are already inventoried, amounting to about 250,000 portfolios, cartons, &c. The second part of the third volume of the *Documenti tratti degli Archivi*, coming down to the year 1445, is published, and the documents, bringing them down to the death of Filippo Maria, are ready for printing.

THE following note on an autograph of Milton, by Dr. Ingram, of Trinity College, Dublin, in *Hermathena*, 1873, p. 248-9, deserves a wider circulation than it has yet had:—

"Very few, I believe, are aware that the library of Trinity College, Dublin, possesses a most interesting autograph of Milton. It is in the volume marked R. dd. 39, which contains several of his controversial tracts. At the beginning of this volume is the inscription, somewhat injured in the binding, 'Ad doctissim(um) virum Patri(cium) Junium Joann(es) Miltonius haec sua unum in f(asci)culum conjuncta mittit, paucis h(um)usmodi lectori(bus) contentus.' The closing words will remind everyone of the 'fit audience find, though few,' of the *Paradise Lost*. Probably in writing the Latin words, as well as the English, he had before his mind Horace's

'neque te ut miratur turba, labores,
Contentus paucis lectoribus.'

The Junius to whom the volume is inscribed must not be confounded with Junius, the philologist, whose

name was Francis; the person meant is Patrick Young, whose biography will be found in Smith's *Vitae*."

MR. D. C. ELWES, F.S.A., contributes to a local paper the results of a close inspection of the parish registers of Chalgrave, Bedfordshire, which he believes to have been the birthplace of the author of *Pilgrim's Progress*. No entry of Bunyan's baptism occurs in the registers of Elstow parish, while in those of Chalgrave not only is the name very frequently found, but in the year 1626 (June 17) the baptism of John Bonyan, son of William Bonyan, is recorded. This date is indeed two years before that which is usually assigned to Bunyan's birth, but Mr. Elwes considers that this is of no importance, while it agrees better with the age at which he is likely to have entered the army. The Bunyan family was certainly seated at Chalgrave as early as the year 1539 (with which the parish register opens), and it is rather remarkable that the name does not occur after 1628, when, it is suggested, the family migrated to Elstow. There is, however, a strong presumption that John Bunyan was never christened in church, if indeed he underwent the rite of infant baptism at all; and we do not think that Mr. Elwes has so far done much to invalidate the tradition of Elstow having been the birthplace of the great master of allegory.

THE friends and admirers of Professor Georg Waitz, who met at Göttingen on August 1 and 2 to celebrate a jubilee in honour of the great historian, have, at the suggestion of Professor Kluckhohn, resolved themselves into an historical association, which is to meet every fifth year at Göttingen, where it invites its members to assemble in August, 1879.

DR. LUDWIG HAUSELMANN, in a recent number of the German periodical, *Im Neuen Reich*, has given an interesting report of the fourth annual meeting of the "Hanseatc Historical Association," which was held this year at Bremen, and will take place next year at Hamburg. In the course of the discussion Dr. R. Pauli, who is so honourably known for his intimate knowledge of English history, and for the numerous admirable works which he has contributed to the literature of the early periods of our Anglo-Saxon and Norman kings, read a paper, in which he traced the relations between the English during the wars of the Roses and the Hanseatc towns generally, and Bremen specially. He related in graphic words the contest which had been carried on for years between the English and the Hansers for mastery at sea, and which in the autumn of 1470 nearly culminated in the ignominious defeat and capture of Edward IV., who, when flying from the pursuit of the Lancastrian party, which was supported by Louis XI. of France, was intercepted in his flight to Holland by the ships of the Dantzigers, and only escaped falling into their hands through the timely aid of his brother-in-law, Charles the Bold, Duke of Burgundy. It was, moreover, solely through the help of the Hansers, who had been won over to his cause by the intervention of the Burgundian duke, that Edward was enabled, in the spring of 1471, to return triumphantly to his own dominions, in spite of the attempts made by the French King to force the deposed Lancastrian dynasty on the English nation. This circumstance, coupled with the fact that the Hanseatc Leaguers secured favourable terms for themselves by the treaty of Utrecht in 1474, which concluded the war between them and England, sufficiently shows the real significance of the democratic mercantile power which then ruled the destinies of so large a portion of northern Germany, and influenced the entire fabric of foreign diplomacy in the German empire. Dr. Pauli has more than once treated the subject of Hanseatc domination, and from the complicated nature of its influence on our own history under the houses of York and Lancaster, it is one that never fails to interest the

English reader. In the absence of full and sufficient materials in this country for the elucidation of that period of our history, we gratefully welcome any fresh light that can be thrown upon it from the well-preserved annals of the old Hansers, who were in turn the allies and rivals in trade of the English, and we may hope that under the careful investigations of Drs. Pauli, Häuselmann, Mantel, and others, the archives of the old Hanse towns may still be made to yield important results to the history of our own and other countries.

NOTES OF TRAVEL.

WITH reference to the quotation from *La Turquie* in our last number, a correspondent writes to us to say that it is erroneous to attribute a very early date to the cisterns which have been recently opened by Mr. Henry Maudesley (not Mosely). These cisterns are connected with an extensive system of water supply, which has been reported on by Lieutenant Conder, R.E., the officer in command of the Ordnance Survey of Palestine. They are within the scarp, or original line of the defence of the hill, which was discovered by Captain Warren, R.E. Rock-cut steps lead to an unknown depth, down the face of this scarp; and the entrance to the cistern is from a sort of landing-place on these steps. That the date of the cisterns is not anterior to the Roman occupation, at the very earliest, is proved by the existence of a round arch in one of them. The "Moabite epoch" of Jerusalem is a date entirely unknown to the historian.

THE forthcoming September number of Petermann's *Mittheilungen* opens with a continuation of the account of Dr. Bernoulli's travels in Guatemala, in the year 1870. In his progress through the country the Doctor was struck with the frequent occurrence of ruined churches and deserted habitations, and at first thought he concluded that the population had greatly diminished, but on reflection he saw that the real explanation was that here, as in most other civilised quarters of the globe, there is a marked tendency on the part of human beings to settle in and on the outskirts of towns. From Don Yorye Ponce, a wealthy proprietor, Dr. Bernoulli elicited some particulars respecting the terrestrial disturbances to which Guatemala has been so subject. For two months they experienced from at least five to six concussions every day, and on some days these actually amounted to thirty and fifty. Animals are apparently wonderfully shy here; though the doctor traversed several uninhabited tracts, the only mammals he encountered were a few foxes, squirrels, and skunks. Still game is to be got with patience. Santa Rosa, which the doctor visited, is about twelve leagues from Guatemala, and from its low situation is a most unhealthy spot. It is garrisoned with a few troops. Other towns were visited by Bernoulli, but the general character of his subsequent remarks does not call for special notice.

An account of the *Challenger's* progress, as compiled from Captain Nares' reports and diagrams, and Captain Davis's articles in the *Geographical Magazine*, next finds place, the cruise of the vessel being followed as far as Tristan d'Acunha. Count Wilczec, the Arctic explorer, contributes a sketch of the configuration and geological structure of Novaya Zemlya, the general scope of the article being to establish beyond a doubt the identity of its formation and character with that of the Ural chain, and the number winds up with a short sketch of the economic progress of Austria during the last quarter of a century.

WE learn from the *Levant Herald* that the question of the water supply from Lake Dercos is still the subject of eager discussion, and the Imperial Society of Constantinople has decided to memorialise the Grand Vizier on the hygienic defects inherent to the project of supplying Constantinople with water from that lake, and praying

for a competent commission of inquiry into the subject.

ACCORDING to the same journal of August 11, the famine in Asia Minor still continues, causing great misery. Sickness was carrying off numbers of the population, and the prospect for the future was most gloomy.

FROM the month of May last Mount Aetna has been in a state of activity that betokens an approaching eruption. It is nearly five years since the torrent of lava issuing from the principal crater covered the valley of Bova; since September, 1869, the mountain has been quiet. Professor Silvestri has passed two days and nights on the summit of the mountain, and from the phenomena he has observed he believes an eruption is imminent.

THE railway now about to be constructed from Naples to the top of Mount Vesuvius, near the crater, will be 26 kilometres (*circ.* 16 miles) long; the localities it serves, to the foot of the volcano, comprising a population of 100,000 inhabitants, who provision the markets of Naples. From Naples to the foot of Vesuvius, a distance of 23 kilometres (about 14 miles), the ordinary rails will be used, and the system of traction by means of iron rails (*drothseil*) will be adopted for the remainder of the way. The second division will be classed into two sections—the one 2,100 metres long, towards Atrio di Cavallo, where will be the drawing machine and the buildings necessary for the railway; the second section, 1,100 metres, will come out a few steps from the crater. The terminus will be sunk 20 metres under the lava. In case of eruption, the current would thus be turned away from the rail, which throughout its whole course will be raised above the level of the soil. Professor Palmieri, director of the observatory at Mount Vesuvius, having observed that the lava, in every eruption, approaches nearer the buildings of the observatory, the opposite side of the mountain will be chosen for laying down the rail. About 250 metres from the projected station at Atrio di Cavallo, Mount Somma makes a spur or projection, of which they will make use to keep all the working stock in case of an eruption. The whole line will be held in communication with the Observatory by means of a telegraph.

The work will be begun at the last section, that is, the part which will go to the top of the crater and spare the fatigue of the ascent. It will not take more than a year to carry out.

THE *Journal de St. Pétersbourg*, under date August 14, mentions the appearance of sharks in such numbers in the Bay of Marseilles as to attract the serious and anxious attention of the municipality of that city. It was decided in council to use every effort to destroy these visitors, by fishing for them from the islands in the neighbourhood.

FROM a report of the English Secretary of Legation at Yeddo, it appears that a law was passed in 1872 by which it was announced that Japan was to be divided into seven educational districts. Each of the inspectors appointed for these districts had the supervision of from twenty to thirty schools, which are respectively classed under the heads of military, high, and elementary schools. Since the promulgation of this law 1,799 private schools and 3,630 public educational institutions have been opened, in which 338,463 boys and 109,637 girls receive instruction. Besides these, 30,000 students attend classes for higher branches of education, and consequently about 480,000, or nearly one-sixtieth of the entire population, are receiving instruction under the new system.

APART from the few miles of railway now open in Japan, we hear that the extent to which, during the past three or four years, wheeled conveyances have come into fashion, is quite astonishing. Both in cities and along the high roads, where wheels can be used, the *jinrikisha*, or

wheeled chair drawn by one man, has been substituted for the old *kago*, or litter carried by two men. The saving of power thus obtained is very considerable, for the *kago* with two porters only travelled thirty miles a day, whereas nowadays one man draws the *jinrikisha* thirty-five miles in the same time. It is said that a Japanese used to pay 5s. 6d. for a day's journey in a *kago*, whereas he can now have a *jinrikisha* for 3s. 6d., the prime cost of the conveyance being about 3l. 10s.

IT is proposed to undertake a regular *exploitation* of the Muncayan copper mines in Manila, in consequence of some very pure copper (about twelve tons), having been got from them and sold at 17 dols. 44 cents per quintal.

THE Historical MSS. Commission reports that amongst the papers of Lieutenant-Colonel Carew, at Crowcombe Court, Somerset, there is preserved a letter from Queen Elizabeth to the Emperor of China [at that time Wan-le of the Ming dynasty], written in 1596, just after the incorporation of the East India Company. In his collection at Knole Park, Kent, Earl de la Warr possesses two long letters written from Japan in 1618 and 1620, to Thomas Wilson, Esq., one of his Majesty's secretaries; these are described as being "full of information about the country."

A RECENT number of *O Novo Mundo* contains a careful review of a work on Brazilian Anthropology by Dr. Conto de Magalhães, which has just been published at Rio de Janeiro. In this work, which is a collection of papers read before societies, or previously issued in periodicals, the author deals mainly with three interesting questions. Man in Brazil he believes to date back 100,000 years. Some of the native languages he considers to belong to the Aryan family; "it is beyond doubt that Sanscrit has furnished 2,000 roots to the Quichua tongue." He discriminates three types amongst the Indian races. A dark race of great stature (*e.g.*, the Guaicurú of Matto Grosso); a lighter race of medium height (the Charante in Goyaz), and another still lighter and smaller, peculiar to the basin of the Amazons, as, for example, the Mundarucú of Pará. The first he regards as the primitive race, the two others as the result of a mixture with white in pre-historic times. The mingling of the races in more recent days has "produced a mixed race, excellent for its energy, courage, sobriety, constancy, and resignation in the endurance of privation and toil." The influence of the half-bloods on the Brazilian people has been great, and is shown in the language, which, in addition to above a thousand nouns borrowed from the savages, has adopted a good number of their verbs and phrases. This racial mixture Dr. Magalhães considers beneficial for Brazil and for humanity. In the great region called Vão de Paraná no white man can live; sooner or later the marsh fevers overpower him. Here, and in other parts similarly situated, the mixed races flourish. So little is known, comparatively speaking, of the anthropology of the New World, that it is to be regretted that Dr. Magalhães has not chosen a language more accessible than Portuguese.

DR. PHILIPPI states in *Das Ausland* that the boundary treaty concluded between Chili and Bolivia describes the borderland according to the old notions of theoretical geography, which gave the Cordilleras of that region sierras, deep valleys, streams, &c., notwithstanding that he had explained its true character in his published journey through the desert of Atacoma. He found a huge plain, on which were scattered isolated mountains, mostly extinct volcanoes, never forming chains, valleys, or passes, but huge clefts often 500 or 600 feet deep, with perpendicular walls, that appeared to have resulted from aqueous action at some former period. At present it only rains about once in from twenty to fifty years. From his description it is evident that a model of this district would look much like certain portions of the moon as seen through a good telescope.

A LONDON ALDERMAN'S JOURNAL, 1796-7.

(Continued from page 208.)

"MONDAY, 6 Feb^r. The report of yesterday is no longer to be concealed. On Friday night Henry Trench Chiswell Muilman, Esq. shot himself at his seat (Debden Hall) in Essex. The desperate deed has caused a very great alarm in the mercantile world; for his connections were most important, and before this fatal war, he was ranked among the first merchants in Europe, and few there were more opulent in point of fortune. Speculations of great magnitude, which have embarrassed his circumstances, w^h have been carried on by a Mr. Nantes a junior partner, are supposed to be one cause, but many must be materially implicated in his fall. . . . I dined at the Jewry with 10 in number, the Recorder in the chair, Capt. Mackenzie of the Navy, &c. Mr. William Wilson came in about eight, with whom and Mr Recorder Callender I eat oysters and scanned men and things till one o'clock. My friend Callender and I never agree, tho' we are always good friends. He is a tooth and nail, or as Alderman Le Mesurier would say, a thick and thin man, so devoted to Messrs. Pitt & Co that there is no arguing with him on any principles of reason, so blind to the slavish doctrines propagated with so much industry and zeal by the tools of government, that he wages eternal war against truth and conviction.

"Tuesday, 7 Feb. 1797. The chat of last night was productive of a promise to dine to-day with Mr Callender at Mr William Wilson's, but before I left the York, I received a note informing me that it was the birth-day of Mr Nutt, which supersedes all other engagements and requiring my attendance at five. At five I was punctual. We had the skull of a very fine cod, excellent cold roast beef, roasted leg of mutton, and a pudding for dinner. The day terminates his 72nd year. When I consider his vast age, his robust constitution, his spirits, his clear judgment, his faculties altogether, his memory & his never failing fund of conversation (tho' we often and almost always differ in public sentiment and political opinion) with his great knowledge of the world of men and of things I do not know within the compass of my acquaintance so extraordinary, so surprising a man. May he enjoy the return of many such days! . . .

"March 1. I forgot to mention that the French landed on the 22nd at a place called Figsard in Pembrokeshire, 1200 or 1500 men from two or three

frigates; but the honest Welshmen turned out armed with pitch-forks in defence of their land and aided by some militia who were at hand, the whole were presently made captives, and surrendered at discretion to Lord Cawdor. The frigates left them. They (i.e. the Welshmen) were commanded by a grey-headed fellow whose name was Tate. With what view these fellows could be there landed and thus deserted is at present mysterious, but the probable conjecture is that they are a banditti of felons whom the French wanted to get rid of; and in that case, we have gained a loss, for while they are here, we must be at the expense of maintaining 'em. We send our felons to a prodigious distance, to New South Wales at a vast expense. They manage these things better in France, by sending their felons to Old South Wales, at no expense at all!

"Friday March 3. The general gloom that pervaded the town was cheered by the arrival of Capt. Robert Calder with the very unexpected news that Sir John Jervis on the 14th ulto (Valentine's Day) had, with fifteen sail of the line only, fallen in with the Spanish fleet, consisting of 27 sail of the line, and by a bold enterprise cut off about one-third of them and after a sharp battle of six hours had the good fortune to capture *Salvator Mundi*, 112 guns, St. Joseph, 112 guns & two others, with comparatively little loss on our side, viz. 300 killed and wounded.

. . . . The maritime history of England does not exhibit so glorious a conquest! Whether the circumstances of the action are considered in regard to the gallantry and skill which were displayed in bringing the enemy to battle, the presence of mind with which the gallant admiral seized on the critical moment, and the science he displayed in pursuing his advantage—the prompt alacrity of his fleet in seconding his efforts, with so little an expense of blood, form altogether such a combination of interesting features as give to this glorious achievement a splendour and importance beyond anything in modern times. This triumph, however, so very unexampled in brilliance, had only the effect to raise the stocks $\frac{1}{2}$ per cent, and that for a very short period. Thanks of both houses were unanimously voted to Sir John, the other admirals, &c.; bells ringing in every quarter, and many a hogshhead of wine I dare say was drunk to the health of the Jolly Tars of Old England!

"Wednesday, 8 March. According to the old mode of reckoning, this is the anniversary of my Birth-day, being born as recorded in the Family Bible on the 8th of March, 1750. Forty seven years ago! What wonderful alterations have been exhibited on the face of the globe since that period, and more extraordinary alterations are at hand, or I am no prophet! This is appointed by Government as a day of Fasting. Humiliation and Repentance—that is, in other words, every body who has a horse rides out, and all get the best dinner they can. I do not recollect that the Frenchmen have appointed such a day since the commencement of the war; they mean to do their business first and go to church afterwards. I hardly know what to make of these kind of things or what is intended by them. If it really is a day set apart for serious duty, and all people would join in it, I certainly could have no objection, though firmly persuaded that fasting and praying will not avail in the contest, but such a day appointed, and by us so kept appears to me a mockery of religion and a perfect farce. It is but justice however to the inhabitants of the country to say that they are infinitely more attentive and zealous than the inhabitants of the Metropolis; and the observation is, I believe, not new.

"Thursday, 16 March 1797. On Tuesday died Mr Ambrose Godfrey at Shaftesbury House, Kensington Gravel Pits, a celebrated chemist in Southampton Street, Covent Garden, and a distant relation of our family; and on the same day died Mr Pope (formerly Miss Younge), a celebrated actress who made her first appearance in Imogen at Drury Lane in the year 1768. I saw her play the character; Mr Holland was the Iachimo, and Mr Powell, Posthumus Leonatus, old Love the Cymbeline. In her line of character—haughty tragedy—she has scarcely left her equal.

"Tuesday, 11 April. On Saturday for the last time appeared the justly celebrated Miss Farren in the character of Lady Teazle, in Sheridan's incomparable comedy of *The School for Scandal*. No occasion in the memory of the most veteran amateur ever drew together a more crowded house, to take a final adieu

of this accomplished actress now destined to move in the high circle of life as the Countess of Derby!

"Wednesday, 12 April. Paris papers up to the 8th inst., with official details from Buonaparte to the Directory of the astonishing achievements of the army in Italy. In no former part of his career has he displayed more of that skill, enterprise and activity, which have distinguished his command, nor in any part of his former exploits has he been more faithfully served by the enthusiasm, discipline and valour of his troops. . . . Thomas Paine embarked with Mr Munro for America on the 19th March.

"Tuesday, 25 April. The Morning Chronicle of yesterday was with me at breakfast, which at all times gives a zest to the bread and butter, and I am disappointed when it fails in attendance. It speaks with some confidence of an account having reached London that our gallant ally the Emperor has been *ex necessitate*—finding from the exhausted state of his finances and the clamours of his subjects, tired with the calamities of war, that he is no longer able to withstand the victorious efforts of Buonaparte—in order to save his crown and the hereditary possessions of the House of Austria, compelled actually to subscribe terms of peace without the knowledge of his good brother the king of England; so that poor honest Mr Bull is left in the lurch at last, as has often been predicted by his best friends. . . . The mutiny of the sailors is over. A Council was held at Windsor on Saturday, when their propositions were agreed to. Their wages are advanced $\frac{5}{6}$ per month, giving them now 1/ per diem without deduction, and their provisions to be full weight without leakage or wastage, &c.

"Wednesday, 3 May. Royal Academy opened on Monday, and it is stated as much improved, and so it ought to be before it can be called good.

"Stocks look brisk, 52 $\frac{1}{2}$.

"Saturday 24 June. Midsummer day, and a terrible day truly for the hay. It rained incessantly and very hard indeed for three hours together. I was three hours coming from the Boro' to Kings Arms Yard, stopping at forty different shops for shelter. With difficulty reached Dolly's where I found my friend Parkinson in an attack upon a real chop, which he did not relish, succeeded by a steak which was the worst he ever tasted, & the wine so execrable that we left a part upon the table. He will never visit Dolly's again for a good dinner. Except in the wine I was more fortunate, but that was a disgrace to the house. My chop was good and so was my steak.

"This day came on the election of sheriffs when Sir William Sterne, alderman of Castle Baynard, and Robert Williams, Esq. alderman of Cornhill Ward were returned duly elected. Lord Lauderdale and Mr Waddington were proposed, but their attempt to speak was drowned in the clamour of the Hall. Wilkes was rechosen Chamberlain, &c. &c. An explanation arrived from France of what they called a separate peace, which as report says is satisfactory; in consequence of which Lord Malmesbury, Lord Pembroke, and Lord Morpeth it is presumed will immediately set out on their Embassy to meet the French Commissioners at Lisle. . . . My decided opinion is that it will end *in fumo* and the stocks at 45, but I would not be a Bear in speculation expecting such an event!

"Sunday, 25 June. On Friday morning died Dr. Warren, one of the most celebrated physicians in town, at his house in Sackville Street. . . . To Billingsgate, where I amused myself an hour in seeing the Gravesend Boats and the yachts for Margate set sail. I dined in the Boro' with my friend Parkinson *en famille* and in the evening walked thro' some gardens near the Kentish Road at the expense of one halfpenny each. We met & saw a variety of people who had heads on their shoulders, and eyes and legs and arms like ourselves, but in every other respect as different from the race of mortals we meet at the West end of the town as a native of Bengal from a Laplander. This observation may be applied with great truth in a general way to the whole of the Borough and all that therein is. Their meat is not so good, their fish is not so good, their persons are not so clean, their dress is not equal to what we meet in the city or in Westminster; indeed upon the whole they are one hundred years behind hand in civilization. I must not however omit their kindness and hospitality, which if to be measured by Mr Parkinson's standard is at least equal to the best in either of the other cities. We do not agree in politics not-

withstanding, my friend thinking well of the ability and integrity of His Majesty's Ministers and the measures of their administration, and I think they are the most prodigate, abandoned and corrupt cabinet that ever presided in the country, weak, impolitic and unconstitutional, having obtained power by the dereliction of every principle of honour and justice, and supporting it by means the most flagitious.

"Monday, 26 June. I dined at Mr. Nutt's, having contributed three as fine mackerel as eye ever beheld, weighing, I should think full 2lbs. each, and which I purchased at Billingsgate for one shilling. We had lamb pie, leg of mutton and a rice pudding. We drank our wine moderately till eight, &c., having scarcely hinted at anything political the whole day. Nothing new or interesting in the more enlarged circle of life, but the Bulls and the Bears had a bit of a struggle, in which I suppose, many were wounded. The stocks vibrated from 54½ to 55½, but left off just as they began, which was 55, leaving the net advantage to the brokers, who may in many instances be compared to the lawyers, who divide the oyster, leaving the shells to their too credulous clients.

(To be continued.)

CORRESPONDENCE.

A PASSAGE IN LEAR.

3 St. George's Square, N.W.

When Lear is about to divide his kingdom between his three daughters, he says to them—

"Tell me, my daughters,

Which of you, shall we say, doth love us most

That we our largest bounties may extend

Where Nature doth with merit challenge?"

Hunter interprets the last line "Where natural and actual affections vie with each other." But surely the meaning is, "Where your natural relation to, and love for me, claim my bounty by deserving it," that is, "among you, my daughters, according to your deserts." And on turning to "challenge" in *Johnson's Dictionary*, ed. Iatham, one finds this passage rightly entered under the meaning "claim as due." F. J. FURNIVALL.

AMERICA AND THE STUDY OF ENGLISH.

"University School," Petersburg, Virginia, U.S.:
July 30, 1874.

I notice in the *ACADEMY* of June 6, under the head of "Notes and News," a paragraph in regard to the systematic study of English in the Southern States of America, calculated to mislead English scholars, and which, unintentionally I am sure, does injustice to the successful efforts made in certain institutions in this State to promote the scientific study of English. This paragraph states that

"the Early English Text Society has just added to the list of institutions to which it sends yearly some of its texts as prizes, the first University in the Southern States of North America where English is systematically taught. This is the University of Mississippi, at Oxford, in the State of Mississippi, where Professor J. Lipscomb Johnson has a class of no less than sixty students in Anglo-Saxon, a class which, for numbers, the one professor of Anglo-Saxon in Great Britain at Oxford (old, not new) probably never even dreamt of having in his wildest moments."

I am sure that Professor Johnson himself would have been the first to correct the error in this statement, had he seen the paragraph in question, for he is a distinguished alumnus of the University of Virginia, where there has been a chair of Anglo-Saxon for nearly fifty years. This professorship of Anglo-Saxon, the first in any American college or university, was established just forty-nine years ago by Thomas Jefferson, "founder of the University of Virginia, and author of the Declaration of Independence."

Almost immediately after the late war, and several years before Professor Johnson accepted his professorship in the University of Mississippi, Professor Thos. R. Price, M. A., also an alumnus of the University of Virginia, and afterwards trained in the best German universities, introduced

at the College of Randolph-Macon, in Virginia, the scientific study of Early English. Professor Price's patient teaching of many years has borne fruitful results, while his brilliant lectures on the subject have kindled an enthusiasm among the younger men in the State in regard to this study which promises much for the future.

It may not be impertinent to add that in the higher (private) schools of Virginia, English has been systematically taught for more than five years.

W. GORDON McCABE,
Master of the "University School."

SCIENCE.

THE ARCHAEOLOGICAL CONGRESS IN STOCKHOLM.

THE first general session of the Congress took place in the Knights' Hall on August 7. Count Henning Hamilton opened the meeting by welcoming the foreign members in a French oration. The Count began by reminding the audience that the Congress in Brussels, two years ago, had selected Stockholm as the gathering-place for its next meeting, and had chosen the Duke of Ostergothland to be President. The loss Sweden had sustained in the death of King Carl obliged his brother to receive the guests, not as President of the Congress, but as King of Norway and Sweden. Count Hamilton went on to say that the accident that Sweden stood behind the southern countries of Europe in respect of climate, wealth, and the gifts of nature, gave special interest to Swedish archaeology, since the civilisation that reigned over the whole south of Europe at a time that was prehistoric to the cold regions of Scandinavia, gave us indications of time that it would otherwise have been impossible to attain. For this reason the scholars of the North have had especial success in dealing with questions of the antiquity of man, and the speaker was in hopes that the learned foreigners who had attended the Congress would have no reason to judge that their long journey had been taken in vain. When Count Henning Hamilton had ended his speech, which was received with prolonged cheers, Professor Capellani rose and proposed that the Congress should elect the Count to be its President, which was agreed to with acclamation. Dr. Hans Hildebrand then ascended the tribune and gave a sketch of the history of Swedish archaeology, which was listened to with deep interest. When this lecture was over, the selection of office-bearers commenced. Among the vice-presidents we notice the names of Nilsson, De Quatrefages, Virchow, and Dupont; and amongst members of the council our own countryman, Mr. Evans, Van Beneden, Rygh, and Engelhardt.

In the evening the city of Stockholm gave an entertainment to the foreign guests in the beautiful place of Hasselbacken. When all were assembled, about 600 in number, Baron Ugglas addressed the meeting, and warmly welcomed the learned representatives of the various European capitals. Bertrand, in reply, dwelt on the services Sweden had offered to the cause of science, on the splendid researches of Linnaeus and Berzelius, on the anthropological discoveries of Retzius, who had given the world the first ideas about the history of races, and on the labours of other eminent Swedish savants. Professor Pigorini supplemented this speech with a special reference to the veteran of living science, Professor Sven Nilsson. At the end of the evening Professor Rosander, calling attention to the fact that Iceland was that very day celebrating her Thousand Years' Festival, dwelt upon the place of that island in archaeology.

On Saturday morning the question under discussion was "What are the earliest traces of the presence of man in Sweden?" Unfortunately, Professor Torell, who was expected to deliver a lecture on this subject, was prevented from attending. Baron Kurch took his place, and after his oration, the Danish Minister, Worsaae, remarked that one prominent sign of the progress of archaeological science was that now not only the remains

from different countries were compared, but also the remains from different provinces in the same country, which enabled observers to follow the development of civilisation more surely. From such comparative investigations the speaker drew the conclusion that the arrival of man in Sweden must date from the end of the Early Stone Age. In the afternoon meeting, when Worsaae was in the chair, the question, "Can the precise way in which the trade in amber was carried on in early times be pointed out?" was under discussion. In the meantime, the French palaeontologist Hamy read a paper on the order of succession of the quaternary strata and remains found in the valleys of the Seine and the Somme, together with the Paris basin. On the question of the day Dr. Stolpe delivered a lengthy discourse, in which he dwelt upon the geognostic distribution of amber, and stated that East Prussia is the richest district in the world for this precious substance. In olden time, however, Europe was chiefly supplied with it from the west coast of Jutland. Amber is also found along the whole coast of the North Sea as far as the Zuider Zee, and the production of it in this district was in former times probably far greater. On the English coast amber is but rarely thrown, and it is far from abundant on the east coast of Jutland and among the Danish islands. The trade in amber seems to have taken two directions, the one from the south coast of the Baltic, and the other from the south-east corner of the German Ocean. The inhabitants of North Europe may have received it also from North Germany, Poland, and Galicia. Light is thrown upon the question when amber was first used by man, by the discovery of it in the graves of the Stone Age, in West Gothland; in only one instance it is known from the Bronze Age, while in the Iron Age it was evidently much in use. Dr. Stolpe mentioned that during his investigations upon Björkö he had found over 1,000 grammes of this substance. Italy had received its amber through Germany and Switzerland. According to Pliny the Germans brought amber to Pannonia, whence the Greeks and Romans received it. Various Roman coins proved the importance of this trade in early times. Professor Capellani supplemented the lecture with remarks on the early specimens of amber found in Italy. Among those who took part in the discussion that followed were Wiberg, from Gefle, Professor Virchow, and Mr. Evans.

On Sunday the members of the Congress visited the museums and public collections of Stockholm.

At the meeting on Monday, the 10th, Professor Desor, from Switzerland, presided. The question of the day was: What characterises the age of polished stone implements in Sweden, and can the remains of this age be referred to a single race, or are we to suppose that several peoples were inhabiting Sweden at the same time? During the discussion the King entered and said a few words of congratulation. Proceedings were then immediately resumed, and the King remained a listener to the close. Dr. Montelius gave a clear sketch of what had been discovered in Sweden of the age under discussion. More than 500 graves dating from this period are known, and are mostly situated close to the sea or near the central lakes. It may be broadly said that the age is most richly represented in Skaane, the extreme south of the country; far less in central Sweden, and not at all in the North. The speaker agreed with Professor Worsaae in believing that Scandinavia was originally entered through Denmark and Skaane. In Norway and the north of Sweden a very different race was dwelling at the time, the builders of cairn-sepulchres. Professor Rygh, from Christiania, showed that the results of his explorations in Norway agreed with those of the last speaker in Sweden. He pointed out that the remains in the north of Scandinavia were not of flint, but of slate, and that they were brought there, without doubt, by the Lapps. These northern remains had scarcely been noticed till a year ago; since

then two very important discoveries had been made, one of a grave at Stenkjaer, near Throndhjem, which had a certain likeness to the Danish *kjökkenmöddings*, in which spears, axes, and knives of bone had been found; the other in the Arctic part of Norway, by the Varanger Fjord. The Professor considered that all these remains were left by the ancestors of the Lapps, and that they had never penetrated farther south than the province of Nordland. Although they lived for many centuries in communication with people who used iron, they remained themselves in the practices of the Stone Age till the beginning of the eighteenth century. Norway and Sweden had therefore two inhabiting races in the Stone Age, the Lapps in the north and the conquering people from Germany and Denmark. Bertrand remarked that it was of great importance for European archaeology that the question should be answered how far the reindeer had been a domestic animal in Scandinavia elsewhere than among the Lapps, as the bones of that animal had in many parts of Europe been found in connexion with human remains. Montelius stated that such bones were never found in the Danish *kjökkenmöddings*, but Dr. Hildebrand had met with examples in Skaane. Worsaae resumed the thread of the discussion. He believed that the old war between archaeologists and historians was drawing to a close. At the Congress of Copenhagen it had been shown that the old belief that the Lapps had once possessed all the north of Europe, and had gradually been pushed northwards, could no longer be held. The result of explorations since that Congress had been to confirm the newer theory, and to show that the Lapps had always dwelt where they do now, since had they lived in the south of Scandinavia, some traces of their presence must have remained. The Lapps, therefore, are not the remnants of the earliest inhabitants of that district. De Quatrefages drew attention to the discovery of a cranium near the North Cape that in no way resembled the Lapponian type, and basing his remarks on the traces of reindeer found in Périgord and other southern districts, was still of opinion that the inhabitants of Europe in the reindeer period followed the reindeer as the climate changed, and found themselves at last in Finmark. He believed the cranium he had spoken of belonged to a still earlier race. A sharp contest on this anthropological question between Virchow and De Quatrefages ensued, and then the meeting closed.

On Monday afternoon a *séance libre* was held under the leadership of Dupont. First De Mortinet gave a sketch of an unpublished monograph on Stone Barrows, in which it was suggested that these were the remains of a primeval race who had abandoned their dwellings, which little by little had sunk down and assumed that form. Hamy described the contents of a barrow at Léry, in the basin of the Eure. Lorange characterised the Stone Age in Norway in terms that resembled sufficiently closely those of Rygh in the earlier part of the day. The discussion then turned on the trade in amber, and reverted again to its original point.

On Tuesday, the 11th, a special train took the members of the Congress out to Upsala. A printed list of the foreign members was circulated this morning. It appears that they were 300 in number. France was most largely represented, sending seventy-five; Germany next, with forty-one. Denmark followed, then England, Belgium and Norway. Some distance behind all these in point of numbers came Holland, Finland, Russia, Italy, the United States, Austria, and Brazil, the last with only three representatives. Portugal sent two, Switzerland and Hungary one each. Only Spain, Roumania, and Greece had not responded to the summons. All these strangers took part in the expedition to the tumuli of Old Upsala. The three vast *Kungshögar* or King's Mounds lie on the ridge of a long elevation in the midst of a country so flat that they are prominent

features from all sides; they were long ago called by Rudbeck, by archaeological licence, the graves of Odin, Frey, and Thor, but they owe their renown to the fact that it was here that fealty was paid to Swedish kings in the middle ages. The eastern one, Odin's Grave, was examined in the years 1846 and 1847, when a horizontal passage was dug from one side into the centre. This passage remained open till 1858, when it became needful to fill it up. The tumuli have all been formed by human hands. In the middle of Odin's Grave was found, low down, a kind of floor of hard clay, and on this ashes, coal, and burnt bones, and over it a heap of stones. Over this last came the great mass of sand and clay that forms the tumulus itself. Under the clay floor was found an urn of burnt clay, covered over with a thin splinter of stone. The urn was full of burnt bones. The antiquities found in the rest of the tumulus were a scorched human lower jaw, a lock of hair, remains of bronze ornaments, melted with the heat, glass pearls, bone combs, little iron nails, dog's bones, and pieces of gold ornaments worked into delicate filigree. The western tumulus has been examined this year; a cutting has been made through it from the summit to the base. The character of the interior was found to be in all essential points the same as that just described, except that no urn was found, and that the remains consisted of scorched human bones, remnants of gold and bronze ornaments, threads of gold which had evidently been woven into clothing, glass pots, combs and other objects made of bone, and a little cameo with an amorino cut in it, apparently of Roman work. The gold ornaments have been edged with pomegranates and worked with filigree. The date of the tumulus is now set down at about the sixth century after Christ. The two Professors Hildebrand gathered as many of the visitors as could enter in the hollow cutting of the tumulus, explaining the features of the scene, and pointing out from the summit the myriad smaller tumuli, of which more than 12,000 existed in Rudbeck's time within the circuit of a Swedish mile around Old Upsala. The visitors then examined the little old church with its two runic stones, and then, under the guidance of Count Hamilton, proceeded to the city of Upsala. Professor Mesteron welcomed them to the University, and then, accompanied by crowds of students and citizens, the Congress proceeded to the Botanical Gardens, where breakfast had been prepared for the members. The hero of the hour was De Quatrefages, who was everywhere overwhelmed with congratulations. Amid a storm of cheers he ascended the steps of Linnaeus' Auditorium, and fervently thanked the students of Upsala and Copenhagen for the special honour they had shown him now, and in 1868. Worsaae recounted the great deeds of the patriarchs of northern archaeology, Elias Fries, of Upsala, and Sven Nilsson, of Lund, veterans who now stood side by side among the assembly; and the venerable Nilsson responded amid a tumult of applause. The Congress eventually visited the Carolina Rediviva Library for the purpose of examining the *Codex Argenteus* of Ulfilas, the cathedral to see the grave of Linnaeus, and finally, the collection of antiquities at the Gustavian Palace. Late in the day a special train took the weary but delighted guests back to Stockholm.

Dr. Hans Hildebrand opened the morning meeting on Wednesday, August 12, by reading a dissertation on the Bronze Age in Sweden. It was certain that the Bronze Age was introduced into Sweden, and did not arise in the country itself. In order to discover whence it came, it was needful to see where else remains of the age were found resembling the Swedish. It was accordingly interesting to study the antiquities of Hungary, the Bronze Age of which country had been so scientifically described by Professor Romer, of Pesth. There appeared to be no visible connexion between these countries, but the Bronze

Age had developed out of a common source in each. Lorange remarked that at the Congress of Copenhagen he had withstood the notion that there had never been a Bronze Age in Norway; and since 1869 fresh discoveries had substantiated his position. It must now be allowed that there are three periods in Norway, as in other countries. Near Frederikshald there were a great many stone tumuli from the Bronze Age, each 10 mètres in diameter, and all situated on heights overlooking the sea or some lake. He had lately examined a similar tumulus near Christiania, and found two knives of bronze. Between Stavanger and Bergen existed another kind of tumulus, formed of earth; these contained skeletons, accompanied by ornaments from the first Bronze Age. In consequence it might safely be taken for granted that this form of culture stretched at least from Frederikshald to Bergen. Besides this, only two months ago he had found near Throndhjem a tumulus from the Bronze Age. There were outlines scratched on the rocks which also proved that Norway was inhabited at that period. Five years ago only ten of these were known; now over 200, and all resemble those found in Sweden so exactly that one might believe the same man had made them all. Mr. Evans described the Bronze Age in England. In the English graves of the period bronze swords are scarcely ever found, but rather axes and daggers. Baron Kurck gave the result of his examinations, namely, that the Bronze Age was really confined to the same part of Sweden as the Stone Age, namely, the south. Montelius gave some account of the figures on the rocks. Hultberg was the first to examine them, thirty years ago; but his drawings were inaccurate, and therefore Count Ehrensward had lately had them all copied anew. Those in Bohus Län are quite different from those in other parts of Sweden. Bruzelius had found similar outlines in Skaane, of which he exhibited two drawings. The south-east of that province contained many such. The subjects of the outlines were ships, with and without men, wheels, serpents, sandals, &c. Desor wished to know what likeness there was between these and the figures found on stones in the dolmens, where also serpents are portrayed, and how the drawings had been imprinted on the stone. The Parisian sculptor, Soldi, explained that the bronze was not hard enough to have made these impressions, for which iron, flint, or steel was necessary. Engelhardt gave some interesting particulars of the domestic animals kept by the people of the Bronze Age. Near Kalundborg, in Zealand, a tumulus had lately been examined, containing bones of oxen, sheep, and goats. Virchow dwelt on the direction taken by trade during the Bronze Age. Worsaae and Schaffhausen then discussed the theory of Lindenschmidt that the Bronze Age in Europe went back to the Etruscans, and a letter was read from the absent professor stating his opinion that no bronze or iron implements found in Scandinavia dated farther back than the tenth or eleventh century, a position strongly opposed by Worsaae. Capellani then read a memoir by Count Gozzadini, who was president of the Congress of Bologna in 1871. It treated of some remains found at Ronzano, near Bologna, including a remarkable sword from the First Iron Age. Desor exhibited some photographs of Swiss lake-dwellings of the Bronze Age. The King and Queen were present during the whole of this meeting.

In the afternoon Mr. Franks presided at a meeting for which no particular subject had been suggested. Different members gave accounts of recent "finds." Von Quast described some remains from the Bronze Age discovered between Berlin and Lübeck. Engelhardt described the gold vases lately found in Denmark. They were hammered and adorned with ornaments of concentric rings. The speaker described other remains of the same period, and was of opinion that none of these objects had been fabricated in Denmark, but brought into the country. Mr.

Franks described bronze remains found in Cyprus, in India, and in a passage made into one of the Pyramids. Pigorini described a terramare near Parma, which he had purchased for the Italian Government. Landberg, of Stockholm, gave an account of bronze remains dug out by himself in Cyprus and at Sidon. Hamy read a paper by Aspelin, the Finlander, on the Stone Age in Finland. Count de Saporta gave a minute account of the discovery of a fragment of tufa near Fontainebleau, on which were impressed the outlines of fig-leaves. The remarkable thing was that these leaves seemed to belong to a species now confined to Japan and the Chinese Islands. Dupont considered this was one more proof that the climate of Europe in the quaternary period was warmer and more uniform than in later times, and that it was then that the reindeer, lion, hippopotamus and hyaena existed side by side.

On Thursday, the 13th, four steamers took the members of the Congress, between 600 and 700 in number, up the Mälär Lake to Drottningholm, where the King joined them. The vessels then proceeded up the lake to Björkö, where Dr. Stolpe delivered an interesting lecture on the island itself and the remains found there. The place that had been occupied by the prehistoric city had an appearance so peculiar, that it was locally known as the "Black Ground." Autumn storms swept up amber, masses of coal, stumps of wood, and the heads of mallets along the shore, and, by dredging the lake-bottom, wrought and unwrought amber, wooden implements, glass pearls, bones of domestic animals, and other objects had been brought to light. The graves around the "Black Ground," the largest gathering of graves in Scandinavia, are more than 2,000 in number, and lie closely packed by one another. They all belong to the Second Iron Age, and burnt human bones are found in them, usually laid in an urn of burnt clay, and accompanied by arms and implements of iron, ornaments of bronze, and bones of animals. It has hitherto been believed that the masses of coal and sand found in the "Black Ground" date from a great fire, that must have destroyed the town, but Dr. Stolpe was of another opinion. The many inflammable objects found unhurt, such as elk's horns, bones of animals, and amber, refuted the old theory completely. No traces of dwellings have been found on Björkö, but Dr. Stolpe concluded that they were wattled and thickly smeared with clay. In the "Black Ground" were found coins, many of them rare or altogether new to science, ornaments, weapons, implements, and now and then a little hoard of silver. The ornaments consisted of bronze clasps and buttons, most of them adorned with the dragon so characteristic of the Second Iron Age. Glass pearls, rock crystals, carnelians, agates, amethysts, and amber had also been discovered. Combs and nails were commonest of all. Figure-outlines had been found, but no runes, from which Dr. Stolpe concluded that the art of engraving runes was not so generally understood as had been imagined. Among the natural-historical remains at Björkö were petrifications from Gotland and Skaane, mussel-shells from the west coast of Sweden, and some cowries (*Cypraea moneta*), probably brought from the east with the Cufic coins and silver bracelets. Of animal bones the number was immense, divided between more than fifty species, and all the marrow-bones had been crushed or cleft. The principal wild beasts were lynxes, wolves, bears, foxes, beavers, squirrels, black rats (unknown in the rest of Europe till the thirteenth century), hares, elks, reindeer and harp seals. Among birds might be mentioned the capercaillie and the white stork. About eleven species of fishes had been found. Finally, Dr. Stolpe was convinced, after a careful consideration of all these copious and varied remains, that the city which had existed on Björkö must have been founded in the beginning of the Second Iron Age, in other words, about the middle of the eighth century after Christ. When it was destroyed no

one knows, but probably about the middle of the eleventh century. There were many reasons for believing that Birka itself stood on Björkö, and if so, added Dr. Stolpe, the Congress was now standing on the very spot from which civilisation radiated out into all parts of Scandinavia. The members then re-entered the steamers, and proceeded to Marienfred, one of the smallest of the Swedish burghs, where they again disembarked. The company passed rapidly through the narrow streets to the royal castle of Gripsholm, one of the most interesting of all the palaces in Sweden in point of historic reminiscence. Below the balcony from which the eccentric widow of Gustavus Adolphus, tired of the responsibility of a crown, fled from her too-devoted people, a supper had been prepared for the members of the Congress, and when the antiquities of the palace had been thoroughly ransacked, the four steamers carried their merry freight back to Stockholm. Some English ladies of archaeological tastes distinguished themselves at Björkö by the zeal with which they attacked the little tumuli with great knives, only too delighted if a burnt bone or a Cufic coin rewarded their innocent sacrilege.

On Friday morning De Quatrefages presided, and the subject of the day was the Iron Age in Sweden, and its relation to the other European nations. Hagemans, of Belgium, described a "find" in the province of Namur, where, at the depth of a metre, a vine-stock had been found (*Vitis lambrusca*), together with an antique vessel. The vine no longer grows in that part of Belgium. The speaker proceeded to discuss the significance of the stone heaps and mounds found in that country, and was of opinion that the worship of Baal had prevailed in Belgium, and that Druidism was far later than the Bronze Age. Chantre described some remains of the Bronze Age from the south-east of France, of which he exhibited plates. Bertrand gave his impressions with regard to the different periods known in archaeology as Ages. He especially attacked the divisions of the Bronze Age, because not only did the Bronze and Iron Ages overlap one another, but they had been positively contemporaneous. These Ages did not agree together in time in different lands: in Germany, for example, the Bronze Age prevailed in the fourth century after Christ, while in Italy already eight centuries before our epoch the full Iron Age existed. The cradle of the Bronze civilisation was the Caucasus, and from thence it had spread in different directions, partly through Greece and Italy, partly through Hungary along the Danube. To show that the connexion between these two Bronze periods had been small, the speaker referred to the evidence of Herodotus and other classical authors, which pointed to a distinct boundary between them running through the centre of Europe. The Black Sea formed the point of exit and of union, and the Argonautic expedition was a literal truth. When we recollected the way in which America had received European culture simultaneously from various points, we had a juster notion of how our European civilisation had come from Asia. Hildebrand pointed out that the name of the First Iron Age had a real significance in Scandinavia, because the boundary lines there between the Ages are distinct and easy to define. Evans agreed with Bertrand that it was unadvisable to insist on the divisions of the Bronze Age. Desor considered that the term "Ages" must only be thought of as a phrase to distinguish different waves of culture. Civilisation followed certain rules in its development, and had fixed stages, which we knew as the Ages. As far as the First Iron Age was concerned, it belonged in Scandinavia to the fourth and sixth centuries; but it was of course quite natural that a difficulty should be felt in defining the boundaries between the Ages. He reminded the meeting that when the buildings on piles began to attract attention, it was supposed that only those belonging to the Bronze Age had the slightest interest, while it had now been shown that those from the Iron Age

were both the most numerous and the most important. He was most anxious to have it generally felt that the great object was not to erect hypotheses, but to go forward on the safe path of exact observation. Von Quast, of Berlin, reminded the Congress that it was from Denmark that the doctrinaire division into "Ages" had gone out into Europe, and there, also, the first effort had been made to create rules for the classification of remains. Worsaae was convinced that it was impossible to draw safe conclusions about the chronological succession of the ages in countries where the examination of remains had not been more completely made than, for example, in France. Greece had had a Bronze Age, and the speaker was quite certain that it had also had an Iron Age. The Bronze Age had arisen in Asia Minor, spread itself over Greece to Italy, Gaul and the British Isles. That Scandinavia produced earlier forms than certain other countries was clearly because the Bronze culture had come to it through Hungary and North Germany. Perrin described a "find" of lake-dwellings in Savoy, and demonstrated from them the existence of a fully-developed Bronze Age in France. Leemans stated that the explorations in Holland were so far from complete, that one could do no more than distinguish between Roman and pre-Roman remains. Bertrand explained that he had not meant to deny the existence of a distinct Bronze Age in the north, but only to say that in France and Italy one could not so define the period. In Italy bronze and iron had been contemporaneous. Greece had had an Iron Age from the beginning. Gaul had received its bronze from the north. Even the Druids possessed iron. Since all this was the case, the exact definition of name was inappropriate. Montelius described the spread of the Bronze Age in Sweden. About 2,500 bronze remains were known, most of them from Skaane. However, the geographical distinction between the distribution of bronze and stone remains was great. Whilst of the latter 30,000 had come from Skaane, and only 7,000 from the rest of Sweden, 1,000 bronze remains belonged to Central Sweden, and only 1,500 to Skaane. This showed that the Bronze civilisation had reached further north than that of the Stone Age, but still not beyond the Dal River. Dupont read a paper on the domestic animals of prehistoric times, and showed the difficulty of determining whether the bones discovered belonged to tame or wild species. The speaker dwelt especially on the horse. This animal occurred in enormous numbers in the quaternary period, and probably played the same part in domestic life as the ox plays now, but disappeared for a long time after the conclusion of that period. However, in the pile-dwellings stables had been found. De Baye described the sculptures in the old grotto in Marne from the Stone Age, and exchanged remarks on the subject with Soldi and Cazales de Fondouce. In conclusion, De Quatrefages invited the members of the Congress to visit the International Congress which the Société de Géographie intended to hold in Paris in 1875.

On Friday afternoon Bogdanow presided. Virchow took the opportunity of the visit to Björkö to describe other old prehistoric towns that can be considered as contemporaneous with Birka. After seeing the remains from Björkö, he could perceive the great likeness between these and the various remains from Pomerania. Indeed traces of the same culture could be found from the Baltic as far south as Moravia. Incidental remarks and descriptions were made by Dircks, Pigorini, Schaffhausen, Zawisza, and Franks.

Professor Leemans presided on Saturday morning, when the question of the day was: "What are the anatomical and ethnical features peculiar to prehistoric man in Sweden?" Nothing of very much importance was said until a lecture was delivered by Baron von Düben, in which, after describing his examination of crania of the present inhabitants, the speaker expressed his conviction that the ancient Swedes (Svear) and Goths had

been, not two, but one primitive race. With regard to the crania of the different graves, the speaker mentioned many interesting facts which showed that they had the same form, whether they were from the Stone, Bronze, or Iron Age. The greater length of cranium in the old heads, and other smaller differences, were not sufficient to constitute the characteristic of a distinct race, but were developments to which the modern race were also subject. In fifty skulls he had examined it was scarcely possible to discover more types than in as many modern heads. With regard to the question of a mixed race in Sweden, the speaker advanced many reasons against the adoption of such a view; and finally remarked that, if there had been a mixed race, the differences could not have been so completely obliterated in the short period of 1800 years, which have elapsed since the arrival of the *Swear*, or the three or four thousand years, which is the highest age which can be attributed to the Stone Age in Sweden. The paintings on Egyptian monuments show us that the character of a race cannot so quickly be obliterated. If one assumes that the primitive race of the stone mounds was a single one, the question then arises, was this single primitive race, like the present, the Svaogothic? This question the speaker was not prepared to determine in the present state of scientific knowledge. Most of the crania discovered were dolichocephalic, a few brachycephalic. Among hundreds which the speaker had examined, only ten were of the latter kind, five of them being from Denmark, and as many from Sweden. They were all found in graves from the Stone Age, and in all probability belonged to another race. These were the crania that Nilsson and A. Retzius described as Lapponian, and it is true that some of them resemble the skulls of Lapps so closely that our present knowledge of craniology does not permit us to perceive any difference. However, there are other data that prove that the Lapps entered Scandinavia round the Gulf of Bothnia, and never have inhabited the peninsula further south than the 62nd degree of longitude. Further facts must, therefore, be collected before any fixed theory can be propounded. Zittel, from Munich, exhibited some flint remains which he had found in the Libyan desert to the west of Egypt, and asked the Congress to decide whether they were formed by human hands. Desor and Hamy were both of opinion that they were, but advised caution in such cases. Engellhardt described the memorial stones, inscribed with runes, which were found in certain Danish and Swedish tumuli of the Stone Age, and asserted that these were never found south of the Ejder, the river that divides Slesvig from Holstein. The art of runewriting sprang up directly the First Iron Age began, and was the result of the skill in preparing surfaces of stone which the inhabitants of the end of the Bronze Age had developed.

At the afternoon meeting De Baye described some drawings on pottery which he had found in Champagne, and which he attributed to the Bronze Age. Belucci, from Perugia, described the remains of the Bronze Age in Umbria. Lorange delivered a lecture on the Iron Age in Norway, which he divided into three distinct periods, of which the first was characterised by countless tumuli containing burnt clay, white ashes, and bones preserved in urns, and which are accompanied by bronze and iron objects, whilst the second period shows the beginning of Roman influence. In one mound, for instance, a vase has been found bearing a Latin inscription. The third period is marked by the constant occurrence of objects that are either of Roman manufacture or show the influence of Roman culture. H. Hildebrand read a paper by Aspelin, on the forms that characterise the Iron Age in Finland, which gave Desor the opportunity of remarking that Aspelin's drawings are the most satisfactory that any archaeologist has yet produced. Lerch concluded by describing what the University of Helsingfors,

under Aspelin's guidance, was doing for archaeological science. The members of the Congress, 900 in number, then adjourned to the harbour, where five steamers took them up the Malar Lake to the royal palace of Drottningholm, where they were magnificently entertained as guests by the King and Queen, and returned to Stockholm at midnight.

On Sunday, August 16, at the final meeting, Count Henning Hamilton read an invitation from the celebrated Hungarian, Professor Romer, begging the Congress to determine to hold their next session in Buda-Pesth, and the Count himself and the vice-presidents strongly seconded the suggestion. Capellani and Desor then thanked the Swedish members of the Congress, the city of Stockholm, the University of Upsala, and the Swedish nation generally, for the unprecedented kindness that had been shown to the foreign guests, and remarked that the world-wide fame of Swedish hospitality and courtesy would now be more widely spread than ever. The president then made a closing speech, after which the votes of the company present were taken on the question, What city shall be the seat of the Congress of 1876? A large majority decided for Buda-Pesth; the minority was in favour of Moscow.

EDMUND W. GOSSE.

MEETING OF THE BRITISH ASSOCIATION AT BELFAST.

MATHEMATICAL AND PHYSICAL SECTION.

ABSTRACT OF THE OPENING ADDRESS OF THE PRESIDENT, THE REV. PROFESSOR J. H. JELLETT, M.A., M.R.I.A.

PROFESSOR JELLETT's address as president of Section A, related mainly to mathematics and to optics, the two subjects which are most intimately connected with his name. In the course of his address he said: In reviewing the history of physical science, we may leave out of sight those sciences, or parts of a science, to which the methods and language of mathematics are applicable without the aid of hypotheses. No scientific man doubts the advantage of applying, as far as our analytic powers enable us so to do, the methods of mathematical analysis to such sciences as plain optics or plain astronomy. Even physical astronomy, although in strict logical precision not wholly independent of hypothesis, has been long recognized as, in the most proper sense of the word, a mathematical science. Wherever, in fact, the fundamental equations rest either on direct observation (as in plain optics) or (as in physical astronomy) upon an hypothesis, if we may venture to call it an hypothesis, so entirely accepted as universal gravitation, the extension of the methods of mathematics is only limited by the weakness of mathematical analysis itself. But there are other sciences, as, for example, physical optics, to which mathematical analysis cannot be applied without the intervention of hypotheses more or less uncertain. And if we would appreciate the true character of scientific progress, the question which we must put to scientific history is this, Is science becoming more or less tolerant of such hypotheses? A principle is assumed, possessing in itself a certain amount of plausibility, and capable of mathematical expression, from which we are able to deduce, as consequences and by mathematical reasoning, phenomena whose reality may afterwards be proved by direct experiment. And from this experimental verification we infer, with more or less probability, the truth of the original assumption. The question, then, which we have to put to scientific history is this, Do the records of science indicate a greater or a less tolerance of this kind of logic? Is the mode of physical investigation which I have shortly sketched gaining or losing the favour of scientific men?

Further on Professor Jellet discusses the abstruse subject of molecular mechanics in the following terms: I pass to the consideration of another

branch of science, closely connected with, and indeed including, physical optics, and exemplifying, even more strongly, the desire of scientific men to extend the sway of mathematics over physical science—I mean, Molecular Mechanics. This branch of mechanical science (if, indeed, it be not more correct to say, this science) is altogether modern. Fifty years ago it had hardly begun to exist, and even now it is in a very imperfect condition. Imperfect as it is, however, it has advanced far enough to mark the progress of science in the direction which I have indicated. And as it is a science more general than physical optics, the indications which we can gather from it are more important. Physical optics does not take us outside our own Section; molecular mechanics shows a marked tendency to carry mathematical analysis into the domain of chemistry. If it shall ever be possible to establish an intimate connexion between this latter science and theoretical mechanics, it is probably here that we shall find the connecting link. In truth it is impossible to contemplate the ever-growing tendency of science to see in so many natural phenomena varieties of motion, without anticipating a time when mathematical dynamics (the science which has already reduced so many of the phenomena of motion beneath the power of mathematical analysis) shall be admitted to be the universal interpreter of nature, as completely as it is now admitted to be the interpreter of the motions of the planets. I do not say that it will ever be. I do not even say that it is possible. It is no true philosophy which dogmatizes on the future of science. But it is certain that the current of scientific thought is setting strongly in that direction. The constant tendency of scientific thought is, as I have said, to increase the number of those phenomena which are regarded as mere varieties of motion. Sound—that we have placed on the list long since. Light, though here our conclusions are more hypothetical, we have also long regarded as belonging to the same category; and Heat may now be fairly added; and we have almost learned, under the guidance of Professor Williamson, to regard chemical combination as a phenomenon of the same kind. All these phenomena (of sound, of light, of heat, and perhaps even of chemical combination) we now regard as produced by the movements of systems of exceedingly small particles—whether of known particles, as in the case of sound, or of the hypothetical ether, as in the case of light; and a science which proposes to itself the mathematical discussion of the laws which govern the movements of such systems can hardly fail to play an important part in the future history of physical science. I shall not then, I hope, be thought to misemploy the time of the section by offering some observations on the science of molecular dynamics.

When we have to deal with a science which professes to be more than a mathematical abstraction—a science which assumes to itself the function of representing, with at least approximate truth, the realities of nature—our first question will naturally be, What is the basis on which it rests? Is it built upon a pure hypothesis, not derived from experiment, but seeking to justify its claim to reality by the truth of the results which may be deduced from it?

The word "molecule," as Professor Clerk Maxwell has told us, is modern, embodying an idea derived from modern chemistry. It denotes a material particle so small as to be incapable of subdivision into parts similar in their nature to itself. Thus a drop of water may be divided into smaller drops, each of which is also water; but a molecule of water is regarded as incapable of such division. Not that we regard it as absolutely indivisible; but we assume that a further division, could it be effected, would produce molecules, not of water, but of its component gases, hydrogen and oxygen.

Now this conception of a molecule undoubtedly involves an hypothesis. Are there such ultimate

particles of matter, not only resisting all the dividing forces which we can command, but absolutely indivisible, by *any* force, into particles similar to each other, or perhaps into particles of any kind? Or are we to suppose that if we had instruments of sufficient delicacy, the process of division might be carried on without limit? Experiment gives us no means of deciding between these alternatives; and if the exigencies of our method of investigation force us to make a decision, we can make it only by an hypothesis. But we may fairly ask, Does the logic of molecular dynamics absolutely require this decision? And on this point I wish to offer one or two remarks. When we propose to determine the motion of a body, solid or fluid, we ought, as indeed in all scientific problems, to form in the first place a clear conception of the meaning of the question which we propose to ourselves. We wish to discover the laws which govern the motion—of what? Not certainly of the body taken as a whole. That is, no doubt, part of the information which we seek, but a very small part of it. When we have learned to determine by a fixed mathematical rule, or formula as we generally call it, the position occupied at any instant by the centre of gravity of the body and by its principal axes, we have learned something, but the investigation is far from being complete. There are, as you know, large classes of movements of which such knowledge would tell us nothing. Thus, to take a familiar instance, you see a man (to use our ordinary language) "sitting quiet." He is at rest, so far as the movement of the body, taken as a whole, is concerned. He is neither turning on his chair nor walking about the room; and yet there is probably not a single particle of his body which is absolutely quiescent. You see, then, how ignorant we are of the vital movements of the human body, if we know only that the individual is "sitting quiet."

Molecular dynamics may fairly be called the differential calculus of physical science. It is, in its relation to physical science, what the differential calculus is in its relation to geometry. As in geometry, when we would pass from the small and exceptional class of rectilinear figures to the infinite varieties of curve-lines, we must invoke the aid of the differential calculus, so when we would pass from the abstractions of rigid solids and unbending surfaces to the contemplation of bodies as they really exist in nature, must we, if we would fully investigate their phenomena, invoke the aid of molecular dynamics. It is the science of that phenomenon which is gradually drawing all others within its sway; it is the science of that phenomenon which, "changed in all and yet in all the same," we have learned to see in every part of nature. Molecular dynamics is the science of Motion in its widest and truest sense—of the motion which passes along in the sweep of the tempest or the fierce throb of the earthquake—of the motion (no less real) which breathes in the gentlest whisper or thrills along the minutest nerve.

Professor Jellott next considers the relationship of Chemistry to Theoretical Mechanics:—

And first, what shall we say of section B? Does chemical science show any indications pointing to a future union with the group already collected under the *genus* (if I may so call it) Theoretical Mechanics? Take, for example, the great problem of chemical combination. Does the treatment of this problem now show any signs pointing in the direction of dynamical science? I desire here to speak with all reserve and even hesitation, being conscious that I am no longer on familiar ground. Still there are signs which even an outside spectator may read. And we may, I think, speak confidently of their direction, although the goal to which they point is far distant and may perhaps be unattainable.

One of these signs is the appearance of *time* as one of the elements of a chemical problem. And in recognising the necessity of a certain time for

the production of a chemical effect, chemists are now pointing not obscurely to the analogy of mechanical science. "Time," says Berthelot, "is necessary for the accomplishment of chemical reactions, as it is for all the other mechanical phenomena." This might not in itself be very significant; but chemists have not merely recognised the necessity of time as a condition for the production of chemical phenomena, they have also undertaken to measure it; or rather, taking the converse problem, they have undertaken to measure the amount of chemical effect produced in the unit of time; and the law of this phenomenon announced by Berthelot takes (necessarily, indeed) a mathematical form quite analogous to equations which present themselves in dynamical science. The next step has followed as a matter of course, and chemists now speak as familiarly of the *velocity* of chemical reactions as engineers do of the velocity of a cannon-ball.

Still more important in its bearing on the future of chemistry, and tending distinctly in the same direction, is the theory of Chemical Combination, which science owes to Professor Williamson, and according to which this phenomenon, like so many others, ought to be regarded as in great measure a mode of motion. We suppose the normal condition of the atomic constituents of a body to be *motion*, not rest; and when we say that a molecule of one substance enters into *combination* with a molecule of another substance, we do not mean that the same molecules constantly adhere together, but that the union between the molecules, whatever be its nature, is continually dissolved and as continually re-formed. According to this theory, chemical equilibrium does not denote molecular rest, but a system of molecular motion, in which these decompositions and recompositions balance each other.

If I may venture to add anything to that which comes from such an authority, I would say that this theory leads us naturally to regard the chemical properties of bodies as, if not wholly modes of motion, yet largely dependent upon the nature of the movements which take place among their constituent atoms. Hence, if two bodies incapable of chemical action are brought into chemical presence of each other, we may suppose that their atomic movements, and therefore their properties, remain unaltered. If, on the other hand, these bodies be capable of acting chemically on each other, their atomic movements are modified by their mutual chemical presence; and therefore the chemical properties of the compound, as we call it, may be wholly different from those of either of the bodies which have entered into combination.

Now we are not yet prepared to consider chemical combination as a problem of molecular dynamics. We have not sufficiently clear ideas (even hypothetical ideas) of these atomic movements, and of the modifications which are caused by the chemical presence of another body, to place the investigation of these phenomena in the same category with the investigation of the phenomena of physical optics; and I am sure that any attempt to hasten unduly the affiliation of chemistry to theoretical dynamics would be productive of serious mischief. The drift of the remarks which I have made has been only to show that the current of scientific thought is setting in that direction; and while we may not predict such an affiliation, still less should we be justified in pronouncing it to be beyond the possibilities or even the probabilities of science.

The address was concluded as follows:—Let none presume to fix the bounds of science. "Hitherto shalt thou come, but no further"—that sentence is not for man. Not by our own powers, not by the powers of our generation, not even by our conceptions of possibility, may we limit the march of scientific discovery. To us, labourers in that great field, it is given to see but a few steps in advance. And when at times a thicker darkness has seemed to gather before

them, men have recoiled as from an impassable barrier, and for a while that path has been closed. But only for a while. Some happy accident, some more daring adventurer—it may be time itself—has shown that the darkness was but a cloud. The light of science has pierced it; the march of science has left it behind; and the impossibility of one generation is for the next but the record of a new triumph.

If seeming plausibility could give to man the right to draw across any path of scientific discovery an impassable line, surely Comte might be justified in the line which he drew across the path of chemistry. Fifty years ago it might seem no unjust restriction to say to the chemist, Your field of discovery lies within the bounds of our own earth. You must not hope to place in your laboratory the distant planet or the scarce-visible nebula. You must not hope to determine the constituents of their atmospheres as you would analyse the air which is around your own door; and you never will do it. Fifty years ago no chemist would have complained that chemical discovery was unjustly limited by such a sentence; perhaps no chemist would have refused to join in the prediction. Yet even those who heard it uttered have lived to see the prediction falsified. They have seen the barrier of distance vanish before the chemist, as it has long since vanished before the astronomer. They have seen the chemist, like the astronomer, penetrate the vast abysses of space and bring back tidings from the worlds beyond. Comte might well think it impossible. We know it to be true.

We have learned from this episode of scientific history that the attempt to draw an impassable line between the domain of the chemist and the domain of the astronomer was not justified by the result. Another generation may learn to obliterate as completely the line between the domain of the chemist and the domain of the mathematician. When that shall be, when Science shall have subjected all natural phenomena to the laws of Theoretical Mechanics, when she shall be able to predict the result of every combination as unerringly as Hamilton predicted conical refraction or Adams revealed to us the existence of Neptune—that we cannot say. That day may never come, and it is certainly far in the dim future. We may not anticipate it—we may not even call it possible. But not the less are we bound to look to that day, and to labour for it as the crowning triumph of Science, when Theoretical Mechanics shall be recognised as the key to every physical enigma—the chart for every traveller through the dark Infinite of Nature.

BIOLOGICAL SECTION.

ABSTRACT OF THE OPENING ADDRESS OF THE PRESIDENT, PROFESSOR PETER REDFERN, M.D.

REFERRING to some of the great revolutions in our knowledge of anatomy and physiology which have taken place within the recollection of those now living, the lecturer first spoke of the discovery of the cell-theory by the late Professor John Goodsir—his account of the production of ulceration by cell-growth, of the characters of the corpuscles of bone, of the structure of lymphatic glands, and of the germinal centres of basement membranes as they were then understood.

At this period the great discoveries of Schleiden and Schwann seemed likely to upset all that had previously constituted Physiology. The idea that all tissues were either composed of cells or had been formed of cells—that nucleated cells elaborated all the secretions and formed the excretions—that their energy lay at the very root of the formation, the reproduction, and the function of every tissue and organ, was a revelation of such astounding simplicity as might well upset men's minds and prevent their seeing beyond.

Cells were then understood to constitute the mass of all organs (the liver, spleen, kidney, and brain), and to be the main agents in the discharge

of their functions—to exist and grow upon the definite membranous walls of the glandular vesicles and ducts—to be fed by blood brought to the attached surface of membranes which seemed almost everywhere to form an absolute separation of the cellular part (the potential gland) from the non-essential blood- and lymph-vessels, the nerves, and framework of the organ.

This great cell-theory has now given place to what I think is certain knowledge, that living matter may move, perform all the functions of assimilation and nutrition, and reproduce its like without having any of the essential characters of a cell. A living mass of protoplasm may change its shape, alter its position, feed and nourish itself, and form other matter having the same properties as it has, and yet be perfectly devoid of any structure recognisable by the highest powers of the microscope.

Mr. Lister showed that the contraction of pigment-cells in the skin changes the position of the pigment-granules, driving them alternately into the processes and the body of the cell. Kühne, Golubew, and Stricker observed changes of form in amoebae (white blood-corpuscles and embryonal capillaries, respectively) after the application of electrical stimuli; and Brücke observed contraction in the pigment-cells of the skin of the chameleon after excitation of the sensory nerves; whilst Kühne noticed contraction in corneal cells after excitation of the corneal nerves.

Thus obvious movements in fixed cells or masses of protoplasm are proved to result from the operation of various stimuli, including nervous stimuli.

But all cells are not fixed. The blood-cells, fixed, as cells of organs, at an early period, become free in the blood-fluid and are moved along by the forces which circulate it until a second time they enter into the composition of the solid tissues by penetrating the walls of the blood-vessels and moving along the substance of the tissues for purposes which are not yet wholly explicable.

Our knowledge of this circulating fluid has marvellously increased. The duration of the life of any of its particles is but short; they die and their places are occupied by others, as was the case with our forefathers, and will be the case with ourselves. It is now a matter of observation, which commenced with Hirt of Zittau, that after every meal an amazing number of white corpuscles are added to the blood: breakfast doubles their proportion to the coloured corpuscles in half an hour; supper increases their proportion three times; and dinner makes it four times as great. They come from such solid glands as the spleen. In the blood going to the spleen, their proportion is one to two thousand two hundred and sixty; in that returning from the spleen it is one to sixty. Every organ and every tissue changes this fluid; and, to my mind, perhaps the most stupendous miracle of organisation is the steady maintenance of but slightly variable characters in the living and moving blood which is every moment undergoing changes of different kinds as it circulates through each tissue and organ in the body.

Yet with all this change there is an invariable transmission of the parental characters by continual descent from particle to particle as each takes the place of a former one; and thus each organ continues to discharge the same function from year to year. Animals of the same kind retain the old number of organs, the same shape of body, and similar modes of life. There is no sign of commencing life, no coining of new vital power, no production of living out of dead matter. The original life extends its limits; it operates in a more extended sphere; but it is the same life, it operates in the same way, it never fails to be recognisable in the individual by the same characters as it had when it was first known. Whatever other functions it discharges, it acts continually in obedience to the first great law; it increases and multiplies and replenishes the earth.

The lecturer then referred to the recent increase in our knowledge of animal membranes, and especially of basement membranes, through the researches of Dr. John Reid, Sir James Paget, and others, assisted by Professor Graham's distinction of substances into the two classes of colloids and crystalloids; to Pflüger's researches on the variable characters of the alveoli, the secreting cells, and the excretory ducts of the salivary glands; Bowman's on the anatomy of the organs of sense; and others; and concluded with a reference to the amount of certainty which physical science has imparted to physiology by furnishing the means of examining and accurately measuring the rates of transmission of nerve-currents, of obtaining tracings of the respiratory movements and of the arterial pulsations, and of examining the retina in the living eye and the larynx of a living man almost as readily as if these parts were exposed in a dissection.

GEOGRAPHICAL SECTION.

ABSTRACT OF THE OPENING ADDRESS OF THE PRESIDENT, MAJOR WILSON, R.E.

MAJOR WILSON'S address, in the Geographical Section, was one of considerable importance. After pointing out in his opening remarks the necessity for a study of physical geography to all who may ever be involved in campaigns, the gallant officer observed:—

To show how varied are the conditions under which war has to be carried on, and how much its successful issue may depend on a previous careful study of the physical character of the country in which it is waged, it is only necessary to remind you of the recent operations on the Gold Coast, brought to a successful issue in an unhealthy climate, and in the heart of a dense tropical forest, where an impenetrable undergrowth, pestilential swamps, and deep rivers obstructed the march of the troops; of the Abyssinian expedition, landing on the heated shores of the Red Sea, and thence, after climbing to the lofty frozen highlands of Abyssinia, working its way over stupendous ravines to the all but inaccessible rock, crowned by the fortress of Magdala; of the march of the Russian columns across the steppes and deserts of Central Asia to the Khivan oasis, one month wearily plodding through deep snow, the next sinking down in the burning sand, and saved from the most terrible of disasters by the timely discovery of a well; and, lastly, of the great struggle nearer home, the last echoes of which have hardly yet passed away, when the wave of German conquest, rolling over the Vosges and the Moselle, swept over the fairest provinces of France. The influence of the earth's crust on war may be regarded as twofold: first, that which it exerts on the general conduct of a campaign; and, second, that which it exerts on the disposition and movement of troops on the field of battle. Military geography treats of the one, military topography of the other. The climate of the theatre of war must always have an important influence on military operations, and should be the subject of careful study. Our own experience in the Crimea shows how much suffering may be caused by want of forethought in this respect. General Verrevkin's remarkable march of more than a thousand miles, from Orenburg to Khiva, with the thermometer ranging from 24° below zero to 100°, without the loss of a man, shows what may be accomplished with due preparation. Nor should the geological structure of a country be overlooked, in its influence on the varied forms which the earth's crust assumes—on the presence or otherwise of water, on the supply of metal for repairing roads, and, if we may trust somewhat similar appearances on the Gold Coast, at Hong Kong, and in the Seychelles, on the healthiness or unhealthiness of the climate. But though mountain ranges and rivers materially affect the operations of war, they are by no means insurmountable obstacles. The Alps have been repeatedly crossed since the days of

Hannibal; Wellington crossed the Pyrenees in spite of the opposition of Soult; Diebitch the Balkan, though defended by the Turks; and Pollock forced his way through the dreaded Khaibar; whilst there is hardly a river in the length and breadth of Europe that has not been crossed, even when the passage has been ably disputed.

Queen Elizabeth's Minister was right when he said that "knowledge is power;" and a knowledge of the physical features of a country, combined with a just appreciation of their influence on military operations is a very great power in war. It was this class of knowledge, possessed in the highest degree by all great commanders, that enabled Jomini to foretell the collision of the French and Prussian armies at Jena in 1807, and in later years enabled a Prussian officer, when told that MacMahon had marched northwards from Chalons, to point unerringly to Sedan as the place where the decisive battle would be fought. As, then, all military operations must be based on a knowledge of the country in which they are to be carried on, it should never be forgotten that every country contiguous to our own—and the ocean brings us into contact with almost every country in the world—may be a possible theatre of war, and that it is equally the duty and policy of a good Government to obtain all possible information respecting it. Is it with much satisfaction that we can turn to the efforts made by this country to acquire that geographical knowledge which may be of so much importance in time of need? Though we had for years military establishments on the Gold Coast, and though we had, more than once, been engaged in hostilities with the Ashantees, and might reasonably have expected to be so again, no attempt appears to have been made to obtain information about the country north of the Prah, or even of the so-called protected territories. The result was that when the recent expedition was organised, the Government had to depend chiefly on the works of Bowdich, Dupuis, and Hutton, written some fifty years ago, and on a rough itinerary of the route afterwards followed by the troops. What advantage has been taken of the presence of the officers who have been in Persia during the last ten years to increase our knowledge of that country—knowledge which would be very useful at present in the unsettled state of the boundary questions on the northern and north-eastern frontiers? How little has been added to our knowledge of Afghanistan since the war in 1842? and what part did India take in Trans-Himalayan exploration before Messrs. Shaw and Hayward led the way to Yarkand and Kashgar? It was with feelings of no slight satisfaction that many of us heard last year that the policy of isolation and seclusion which India appears to have adopted as the last soldier of Pollock's relieving force recrossed the Indus was at last to be broken, and that an expedition well found in every respect was to be sent to Kashgar. It seemed an awakening from the long slumber of the last thirty years, during which we were content to stay at home in inglorious ease, resting under the shadow of the great mountain ranges of Northern India, whilst we sent out mirzas and pundits to gather the rich store of laurels that hung almost within our grasp. Far be it from me to depreciate the valuable services of those gentlemen—services frequently performed at great personal risk and discomfort; but who can compare the results they obtained with those that would have been brought back by English officers, or by travellers, such as Mr. Shaw, Mr. Ney Elias, and others? Let us, then, hope that the Kashgar mission may date the commencement of a new era, during which geographical enterprise may be encouraged, or at any rate not discouraged, amongst the officers of the army; and that if few will now deny that a knowledge of Ashantee, of Yemen, of the northern and north-eastern frontiers of Persia, of Merv, Andkin, Maimana, Badakshan, and Wakhan, would

have been of importance in the years just passed, it may not be forgotten that a knowledge of these countries may be of still more importance in a not far-distant future. May we not take a hint in this respect from our now-near neighbours in Central Asia, the Russians? No one who has followed their movements can fail to have been struck by the intense activity of their topographical staff, an activity that can only be compared to that of England at the period when Burnes, Eldred Pottinger, Wood, Abbott, Connolly, and others whose names are ever fresh in our memories, were penetrating into the wildest recesses of Central Asia. The Russians are indeed far in advance of us in all that relates to those survey operations, and that geographical exploration which should always be carried on simultaneously with the advance of an expeditionary force into an unknown or but partially-known country; they have long since realised the necessity of accurate geographical knowledge, based on sound systematic survey, and, having learned in time the lesson that opportunities once lost may never be recovered, make every effort to take advantage of those that are offered to them. In the expedition against Khiva, each column had attached to it an astronomer and small topographical staff, whose duty it was to fix the positions of all camps and map the route and adjacent country, whilst officers on detached duty were instructed to keep itineraries of their routes which might be fitted in to the more accurate survey. On the fall of Khiva, an examination of the Khanate was at once commenced, and it was even thought necessary to send Colonel Skobelof, disguised as a Turcoman, to survey the route by which Colonel Markosof should have reached the oasis. It is much to be regretted that some such system was not adopted during the recent operations on the Gold Coast, and that so little, comparatively speaking, has been added to our knowledge of Ashanti and the protectorate. The conclusion of peace with King Coffee, and the effect that must have been produced on the inland tribes by the destruction of Cumassi, appear to offer facilities for the examination of a new and interesting region which, it is to be hoped, will not be neglected by those who are able and willing to take part in the arduous task of African exploration.

In every country in Europe, except Spain, Turkey, and Greece, great topographical surveys are either completed or in progress. Frederick the Great was, I believe, the first to recognise that in planning or conducting operations on a large scale, as well as directing many movements on the field of battle, a commander should have before him a detailed delineation of the ground. To supply this want, Frederick originated military topography, which, in its narrower sense, may be defined as the art of representing ground on a large scale in aid of military operations. It was found, however, that during war there was rarely sufficient time to construct maps giving the requisite information, and thus the necessity arose of collecting in peace the requisite data. In this necessity may be seen the origin of all national topographical surveys, including our own, which was commenced as a purely military survey in 1784 by General Roy, and transferred in 1791 to the old Board of Ordnance. Side by side with the large establishments engaged in the production of the topographical maps, there have grown up in most countries extensive departments, sometimes employing from fifty to sixty officers, whose duty it is to supplement the maps of their own and foreign countries by the collection of all information, of whatever nature, that may be useful in time of war. The brief interval that elapses between the declaration of war and the commencement of hostilities, the rapid movements of armies, and the short duration of campaigns at the present, have shown more clearly than ever the imperative necessity of previous preparation for war.

The progress of the European surveys, and especially of our own, has been marked by many

results which have indirectly influenced the advancement of geographical science. Such are the improvements in instruments made during the progress of the triangulation, the introduction of the Drummond light, Colby's compensating bars, &c.; the connexion of the English and Continental systems of triangulation; the pendulum observations at various places; the measurement of arcs of the meridian; the comparison of the standards of length of foreign countries, of India, Australia, and the Cape of Good Hope, with our standard yard, which has recently been completed at the Ordnance Survey Office, Southampton. In the same category may be placed the improvements in the art of map engraving, in the application of chromo-lithography to the production of maps; and the employment of electrotyping to obtain duplicates of the original plates. The method of copying maps by photography without any error in scale, or any distortion that can be detected by the most rigid examination, was first proved to be practicable, and was adopted in the Ordnance Survey Department in 1854, by Major-General Sir Henry James, for the purpose of facilitating the publication of the Government maps of the United Kingdom on the various scales. Since that the development of the various photographic processes has been brought to a high state of perfection. During the last five years photographic negatives on glass covering an area of 10,071 square feet were produced at the Ordnance Survey Office for map-making purposes alone, and from these negatives 21,760 square feet of silver prints were prepared. An area of 959 square feet of the negatives was also used in producing 13,595 maps on various scales by the photo-zincographic process, which was also introduced by Major-General Sir Henry James. It was by similar processes that the Germans were enabled to provide the enormous number of copies of the various sheets of the map of France required during the war of 1870-1. Our great national survey is the most mathematically accurate in Europe, and it speaks much for the ability of the officers who have brought it to its present state of perfection, that from the very first they recognised the necessity of extreme scientific accuracy in their work.

Turning to the appliances for geographical instruction, I cannot but think that the use of models as a means of conveying geographical instruction has been too much neglected in our schools. If any one considers the difficulty a pupil has in understanding the drawing of a steam engine, and the ease with which he grasps the meaning of the working model, and how from studying the model and comparing it with the drawing he gradually learns to comprehend the latter; he will see that a model of ground may be used in a similar manner to teach the reading of a map of the same area. Relief maps of large areas on a small scale have their uses, but they are unsuitable for educational purposes on account of the manner in which heights must be exaggerated; this objection, however, does not apply to models of limited areas on a sufficient scale, which always give a truthful and effective representation of the ground. One reason why models have not been more used has been their cost, but the means of constructing them with ease, rapidity, and at slight expense are quickly accumulating as the six-inch contoured sheets of the Ordnance Survey are published. Instruction in geography should begin at home, and I would suggest that as the six-inch survey progresses, each decent school throughout the country should be provided with a model and map of the district in which it is situated. If this were done, the pupils would soon learn to read the model, and having once succeeded in doing this, it would not be long before they were able to understand the conventional manner in which topographical features are represented on a plane surface, and acquire the power of reading not only the map of their own neighbourhood, but any map which was placed before them. In our wall maps

I think we have been too much inclined to pay attention to the boundaries of countries, and to neglect the general features of the ground. I fear instruction in physical geography too often comes after that in political geography, instead of a knowledge of the latter being based on a knowledge of the physical features of the earth. My meaning may perhaps be explained by reference to the well-known wall map of Palestine, which frequently disfigures rather than ornaments the walls of our school-rooms. In this map there are usually deep shades of red, yellow, and green, to distinguish the districts of Judea, Samaria, and Galilee, and perhaps another colour for the Trans-Jordanic region, with a number of Bible names inserted on the surface, whilst the natural features are quite subordinate, and sometimes not even indicated. There is perhaps no book that bears the impress of the country in which it was written so strongly as the Bible; but it is quite impossible for a teacher to enable his pupils to realise what that country is with the maps at present at his disposal. The first object of a wall-map should be to show the geographical features of countries, not their boundaries, and for this purpose details should be omitted, and the grander features have special attention paid to them. In school atlases the same fault may be traced, physical features being too often made subordinate to political divisions; and there is also in many cases a tendency to overcrowd the maps with a multitude of names which only serve to confuse the pupil and divert his attention from the main points. The use of globes in our schools should be encouraged as much as possible, as there are many physical phenomena which cannot well be explained without them, and they offer far better means of conveying a knowledge of the relative positions and real sizes of the various countries, seas, &c., than any maps. The great expense of globes has hitherto prevented their very general use, but some experiments are at present being made with a view to lessening the cost of their construction, which it is hoped may be successful. I cannot pass from this subject without alluding to that class of maps which gives life to the large volumes of statistics which are accumulating with such rapidity. On the continent these maps are employed to an extent unknown in this country, both for purposes of reference and education, and they convey their information in a simple and effective manner.

The gallant President then briefly passed in review the principal geographical events and doings of the day. He alluded to the importance of Lieutenant Cameron's work on Lake Tanganyika and of its probable results, and noticed the departure of two Engineer officers, Lieutenants Watson and Chippendale, to survey Colonel Gordon's province in Central Africa. The survey of Palestine had led to the formation of an American society for the exploration of the country east of Jordan, and a German society for the exploration of Phoenicia. The American society was prospering, but our own was unfortunately languishing for want of funds. After touching on the work of Colonel Baker and Lieutenant Gill on the northern frontier of Persia, of the Kashgar mission in their route across the Pamir, and of Colonel Warburton's important journey across Australia, Major Wilson said he could not help thinking that the expeditions sent out by Yale College, U.S., to explore the Yellowstone country, Arizona, Oregon, and the Aleutian Islands might well serve as an example to the older institutions of Oxford, Cambridge, and Dublin. Captain Anderson, R.E., had been engaged in running the demarcation line along the forty-ninth parallel of latitude between the Missouri and Saskatchewan rivers. In the south, Commanders Lull and Selfridge had found practicable routes for ship canals from Greytown by Lake Nicaragua to Brito on the Pacific, and by way of the Atrato from the Gulf of Darien to a point near Cupica on the Pacific, the cost of the

latter being estimated at twelve million pounds. In South America Professor Orton had been extending our knowledge of the Amazon country, and the Peruvian Government was actively promoting the exploration of the little known parts of Peru. In conclusion, Major Wilson expressed his regret at not being able to give any positive assurance of the prospect of a Government Arctic expedition, but there was an idea that the Prime Minister was not unfavourable to the project. The exploration of the still undiscovered region was trivial compared to what had been done. He for his part would emphatically exclaim, "It is to be done, and England ought to do it!"

Thursday.—SECTION D.

Dr. Huggins gave an account of some experiments he had made on Coggia's comet, which was so striking an object in the northern sky a few weeks ago, with the spectroscope. Before the spectroscope was applied to comets, the polariscope had shown that a part only of their light was polarised, or reflected solar light. It was uncertain what the other part consisted of. The question, therefore, which the spectroscope had to determine was whether the light of comets was emitted by matter of which they consisted; what were the conditions under which this light was emitted, and what was the chemical nature of the matter which emitted the light. The result of this examination was to show that certainly a large part of the light of comets was not merely reflected solar light. In some small telescopic comets which he observed in 1866-8 he found by the application of the spectroscope that part of their light consisted of three bright bands which were apparently identical with the bright bands characteristic of carbon, either alone or in combination. Coggia's comet was the first bright one, however, to which the spectroscope had been applied. When the slit of the spectroscope was placed on the diameter of the head of the comet, the nucleus gave a continuous spectrum, and the other parts of the comet gave a spectrum of three bright bands similar to those seen in former comets; the relative proportion of the three bright bands and the continuous spectrum in which they fell varied in different parts of the comet. When the slit was placed across the bands were bright; when the slit was brought back behind the nucleus at the beginning of the tail, the bands became so faint that only one could be traced upon the continued spectrum. On comparing the bright bands with those of carbon, they were found to have a general correspondence. The bands of the comet were so far shifted, however, as to indicate—supposing there really was carbon in the comet—that the relative motion of the approach of the comet to the earth was forty-six miles per second. The comet really, however, approached the earth at the rate of twenty-four miles per second; and it was, therefore, uncertain whether the whole or part of the difference in this velocity was due to the motion of matter within the comet. The brighter portion of the head of the comet was due evidently to a larger proportion of the matter giving a continuous spectrum. It seemed probable, therefore, that the nucleus was of solid matter, heated by the sun and throwing out matter which formed the coma and tail; and part of this was in a gaseous form, giving the spectra of bright lines. The other portion existed probably in small incandescent particles; the polariscope showing that certainly not more than one-fifth of the whole light was reflected solar light.

Friday.—SECTION A.

Dr. Andrews read a paper on "Experiments at High Pressures." He began by giving a description of the method which he employed in his experiments on the continuity of the liquid and gaseous states of matter, to obtain in closed

vessels connected with fine capillary glass tubes pressures reaching to 100 and even 300 atmospheres. This is effected by a conical connection between the glass and metal, and by introducing a well-packed steel rod into the interior of the apparatus, which is filled either with water or mercury. The compressibility of liquid sulphurous acid was stated (unlike that of water) to diminish as the pressure increases. But the most elaborate experiments referred to were made on a mixture of three volumes of carbonic acid with four volumes of nitrogen, and graphic curves were shown exhibiting the result of compressing this mixture to 300 atmospheres of pressure at various temperatures from 2° to 48° C. The very important result was announced that even at 2° the carbonic acid in such a mixture could not be liquefied under any pressure. In short, the critical point (a term introduced into this branch of science by Dr. Andrews) of carbonic acid becomes lowered many degrees when that gas is mixed with a non-liquefiable gas such as nitrogen.

SECTION C.

Mr. W. Pengelly, F.R.S., read the tenth report of the committee for exploring Kent's Cavern, Torquay. The investigation has been pursued without interruption during the entire period which has elapsed since the meeting at Bradford, in 1873. The mode of operation had been described in previous reports. The interest felt in the explorations by the inhabitants and visitors to Torquay has suffered no abatement. The branches of the cavern in which the researches have been carried on since the ninth report was presented in 1873, are those known as the long arcade, Underhay's gallery, the cave of inscriptions, and Clinick's gallery. The exploration of the former two has been completed, but the work is still in progress in the latter. Letters of all sizes, from some fully three inches in height to others as small as ordinary writing, cross each other, and thus add to the difficulty of decipherment. Some of them were cut out with great care and finish, and must have occupied a large amount of time, while others were but hasty scratches. It seemed to have been somewhat fashionable to surround the inscriptions with rectangular parallelograms, varying from 6.5 to 3.75 inches in length, by 5.5 to 3.5 in breadth; at least four of them belong to the seventeenth century, and the earliest of the series, so far as at present known, is that of "Peter Lemaire Richcolby, of London, 1615." Underhay's gallery was found, when the work of exploration was completed, to be about 20 feet long, from 2.5 to 7 feet wide, and from 6 to 7.5 feet in height. The late Mr. Underhay found on striking into the stalagmite a few small bones, which he succeeded in bringing out, and which were found to be phalanges of human feet. Though the specimens did not appear to be of an antiquity at all approaching that of the cave hyena and his contemporaries, the superintendents, who were familiar with them, very carefully watched the progress of the work in the hope of finding some further traces of skeletons; and on reaching Mr. Underhay's very limited diggings they met with a series of bones, all on and in the stalagmite, some of which were certainly human, whilst others were as clearly not so. Amongst the flint implements found in Brixham cavern that known as the G-8 has attracted considerable attention. First, Very near the spot occupied by the specimen there rises a vast cone of stalagmite with an inscription on its surface, which shows that it has undergone no appreciable augmentation of volume during the last two and a-half centuries. Second, Prior to that was the period spent in rearing the greater portion of this cone, which measures upwards of 40 feet in basal girth, reaches a height of fully 13 feet, and contains more than 600 cubic feet of stalagmite matter. Third, Still earlier was the era during which the cavern floor was introduced, in a series of successive small instalments with protracted periods of intermittence, when the

cavern was alternately the home of man and of the cave hyena, and the latter dragged thither piecemeal so many portions of extinct mammals as to convert the cave into a crowded palaeontological museum. Fourth, Further back still was the period during which the base or nucleus of the cone or boss was laid down in the form of crystalline stalagmite. Fifth, and earliest of all, was the time when materials not derivable from the immediate district were carried into the cavern through openings now probably choked, entirely unknown, and the direction in which they lie but roughly guessed at, when apparently the cavern-haunting hyena had not yet arrived in Britain. At an early stage in this earliest era man occupied Devonshire, for prior to the introduction of the uppermost four feet of breccia, one of his massive unpolished tools, rudely chipped out of a nodule of chert, found its way into a recess in the cavern, and had a character such as to show that it must have been undisturbed in the same spot until it was detected by a committee of the British Association.

Mr. R. H. Tiddeman read the report of the committee for assisting in the exploration of the Settle Victoria Caves. The author had received an important communication from Professor Busk, to the effect that a certain bone from the Victoria Cave which had been in his possession some time, and had been doubtfully referred to elephant, was undoubtedly human. The bone was exhumed in 1872. There were also two small molars of *Elephas*. Dr. Leith Adams, after a careful examination and comparison with type specimens in the British Museum, pronounced them to be *E. antiquus*, an opinion in which Mr. Davis concurs. On December 19 Mr. Busk read a paper on the human remains to the Anthropological Institute. He states that there is nothing in the condition of the bone opposed to its belonging to the most remote antiquity, nor to its owner having been coeval with the extinct mammalia mentioned above, with whose remains the specimen differs in no appreciable degree as to condition. Its interest, therefore, as representing one of the earliest extinct specimens of humanity, will be at once obvious. The author then recapitulated the order and succession of the beds inside and outside the cave, and their relation the one to the other, and then exhibited bones and objects of interest which had been found.

SECTION D — (SUBSECTION OF BOTANY AND ZOOLOGY).

Dr. Carpenter read a paper entitled "Further Researches on *Eozoon canadense*." He contended that the hypothesis of the foraminiferal origin of *Eozoon canadense* entirely accorded with the features alike of the general and of the minute structure of the best preserved specimens of this body, and that it is the only hypothesis which fits all the facts of the case; whilst the hypothesis of subsequent metamorphic change, which has every probability to recommend it, fully accounts for all the appearances on which the anti-Eozoonists rely as evidence of its mineral origin, which in the face of the new evidence he adduced, was to his mind utterly "unthinkable." Until these facts shall have been disproved by the examination of the specimens which he was ready to submit to any or all of his opponents, he must claim to withdraw from a controversy which cannot be carried further to any advantage without a "comparison of actual specimens." Whilst he admitted to the full every evidence of mineralisation adduced by Professors King and Rowney (of Galway), they did not admit the evidence of organic structure which they had not seen, but which he had expressed his willingness to place before them, with the parallelisms presented by recent foraminifera. He was endeavouring to engage his Canadian associates in the preparation of a joint monograph on *Eozoon canadense*, to be offered to the Palaeontographical Society, with a request that before determining either to accept or to decline it, the Council would

appoint a committee of "experts," qualified by their knowledge of micro-palaeontology and micro-mineralogy to judge whether what they held to be organic structure could possibly be regarded as the product of any kind of physical or chemical action.

SUBSECTION OF ANATOMY AND PHYSIOLOGY.

Professor Redfern read a paper on the influence of food, and the methods of supplying it to plants and animals. Plants, he said, entirely uninfluenced by any but physical conditions, had long since taught farmers, and gardeners especially, that they must not only have abundance of food, but that they must have it in a condition in which they can readily make use of it. In proof of this, he need only refer to the known necessity for the regular use of highly nutritious liquid manure in the cultivation of perfect roses, and to the care the agriculturist had learned to take in the application of the proper kind of artificially-prepared manure for each crop, and in its use in a form in which the plant could most easily absorb and apply it. It was many years since that Mr. Ward gave a beautiful illustration of the influence of food on plants. He found a perfect specimen of the common centaury half an inch high, with one or two pairs of most minute leaves and one flower, on the bare chalk at the border of a wood; on tracing it into the open parts of the wood, it became a glorious plant, 4 or 5 feet high, and covered with hundreds of flowers. He wished to show that it was not only important to supply plants with food, but to do this so that they could easily appropriate it, otherwise the supply would be lost and wasted. He had brought with him a series of specimens of common rape which would speak for themselves. The largest specimen measured 5 feet 6 inches high; they branched freely from the ground upwards at intervals of a few inches: their large leaves, thick and fleshy, measured 14 inches by 6 inches, and their flowers once covered the plants with their brilliant yellow colour. The middle-sized specimens measured 5 feet 2 inches high, but for 3 feet from the ground they had no branch at all; their leaves were very small, and the plants were little more than a fibrous stem, with a few flowers at the top. The smallest specimens were only three feet high, having a few leaves not an inch long by 3-16ths of an inch broad, and a few flowers at the top entirely useless for any purpose whatever. Other specimens of an essentially similar kind were grown on another spot of ground, under circumstances essentially similar. Of these specimens a large number only measured 15 inches high; they were furnished with a few almost linear leaflets and a few flowers at the top. Yet the larger specimens grown on this ground were 5 or 6 feet high, covered with large spreading branches, furnished with abundance of leaves, yielding a very large amount of good fodder compared with the amount of surface covered by them. With regard to the roots, those of all the poorer plants were straight, small, and but little branched; while those of the well-developed plants were thick, branched, and extended on one side only. For from 4 to 6 feet distant from the edge of the plot of rape on each side the ground had been trenched two spades deep for planting with trees and shrubs, and a quantity of bog earth with sand and manure had been mixed with it, the manure having been put at the bottom of the trench, and the mixed bog earth and sand half way down. The only well-developed plants grew near the edge of this trenched ground, and their one-sided roots spread into it for two feet, exactly in the position occupied by the mixed bog earth and sand. There were only occasional smaller plants at this part, and the roots of every one of these were straight, short, and but little branched. They, in short, had not discovered that there was soft and spongy ground within so short a distance, ground in which their roots might have revelled in growth like those of their neighbour giants, if they had been equally fortunate in finding their way thither. None of the

thick long roots on the trenched side of the plants penetrated deeply into the trenched ground. It was the loose and spongy condition of the soil that had attracted them, and not the manure, for not one root had attempted to penetrate to the depth of the manure—all had been content with the position of the mixed bog and earth and sand, thus affording an absolute demonstration of the necessity of attending to the mechanical conditions of the soil, as well as to its containing a sufficiency of the materials which plants needed for food. His plants of rape had abundant nourishment in their immediate vicinity, but they could not avail themselves of it, the soft sponginess of their roots being unable to penetrate the tough clay which a great amount of labour had failed to render porous enough for roots of any kind to enter to any considerable extent. Such was exactly the condition in which many persons were who had never applied their intelligence to the selection of their food or to the methods of taking it. There were few social problems more important than how to acquaint the wife of the labourer and artisan, or even the wives and servants of the middle classes, how to expend a fair share of their income upon food to the greatest advantage, and how to prepare it without destroying its nutritive properties. A savoury dish of meat was often prepared by mincing or cutting the meat into small and more or less cubical blocks. It was then stewed or more frequently boiled; the outer surface of each little block had its albumen firmly coagulated, and the whole was converted into about as indigestible a mass as could well be imagined, the high priced and highly nutritious meat having been destroyed for the purposes of nutrition, and the action of the digestive organs probably injured for some time to come. Or good and valuable flesh meat was subjected to the process of salting, which first of all abstracted the juices of meat, and then hardened the fibres, so as to destroy or greatly deteriorate its digestibility. No doubt it was convenient to have a hardened dry mass of meat, incapable of much change for months, and ready to be used for the purpose of filling the stomach and effectually satisfying the appetite; but these were not the purposes for which food was intended to be used. It ought to be capable of supplying the waste of the body, and of being easily converted into heat and motion. If it failed in these particulars it would also fail in nourishing the brain, and aiding in the evolution of intelligence, and thus intellectual and bodily power was lost to the community, and deterioration of race was promoted. His colleague, Dr. Gordon, said that he recollected running races, putting the stone, wrestling, and other athletic exercises being the favourite amusements of the sons and servants of the farmers in the County Down. Now nothing of the sort was heard of. These young men found a short day's work almost too much for them, and at the end of it they were to be seen lying about indulging in idle conversation. Coincidentally with this they imagined themselves the equals of their masters and mistresses, and that the healthful oatmeal porridge and buttermilk twice daily, with beans and bacon for dinner, was too strong and coarse; they insisted on more delicate fare, and demanded a supply of tea and white bread. They were unconscious that persons in their position but a few years ago possessed amazing vigour, and performed twice the amount of labour with greater ease, and when the day's work was over actually revelled in the display of surplus strength, which nothing but their better and more rational diet could have yielded them.

ADDRESS TO THE DEPARTMENT OF ZOOLOGY AND BOTANY, BY DR. HOOKER, C.B., D.C.L., PRES. ROYAL SOCIETY.

I HAVE chosen for the subject of my Address to you from the chair in which the Council of the British Association has done me the honour of

placing me, the carnivorous habits of some of our brother-organisms—Plants.

Various observers have described with more or less accuracy the habits of such vegetable sportsmen as the Sundew, the Venus fly-trap, and the Pitcher-plants, but few have enquired into their motives; and the views of those who have most accurately appreciated these have not met with that general acceptance which they deserved.

Quite recently the subject has acquired a new interest, from the researches of Mr. Darwin into the phenomena which accompany the placing albuminous substances on the leaves of *Drosera* and *Pinguicula*, and which, in the opinion of a very eminent physiologist, prove, in the case of *Dionaea*, that this plant digests exactly the same substances, and in exactly the same way that the human stomach does. With these researches Mr. Darwin is still actively engaged, and it has been with the view of rendering him such aid as my position and opportunities at Kew afforded me, that I have, under his instructions, examined some other carnivorous plants.

In the course of my enquiries I have been led to look into the early history of the whole subject, which I find to be so little known and so interesting that I have thought that a sketch of it, up to the date of Mr. Darwin's investigations, might prove acceptable to the members of this Association. In drawing it up, I have been obliged to limit myself to the most important plants; and with regard to such of these as Mr. Darwin has studied, I leave it to him to announce the discoveries which, with his usual frankness, he has communicated to me and to other friends; whilst with regard to those which I have myself studied, *Sarracenia* and *Nepenthes*, I shall briefly detail such of my observations and experiments as seem to be the most suggestive.

Dionaea.—About 1768, Ellis, a well-known English naturalist, sent to Linnaeus a drawing of a plant, to which he gave the poetical name of *Dionaea*. "In the year 1765," he writes, "our late worthy friend, Mr. Peter Collinson, sent me a dried specimen of this curious plant, which he had received from Mr. John Bartram, of Philadelphia, botanist to the late King." Ellis flowered the plant in his chambers, having obtained living specimens from America. I will read the account which he gave of it to Linnaeus, and which moved the great naturalist to declare that, though he had seen and examined no small number of plants, he had never met with so wonderful a phenomenon:—

"The plant, Linnaeus says, shows that Nature may have some views towards its nourishment, in forming the upper joint of its leaf like a machine to catch food; upon the middle of this lies the bait for the unhappy insect that becomes its prey. Many minute red glands that cover its surface, and which perhaps discharge sweet liquor, tempt the poor animal to taste them; and the instant these tender parts are irritated by its feet, the two lobes rise up, grasp it fast, lock the rows of spines together, and squeeze it to death. And further, lest the strong efforts for life in the creature just taken should serve to disengage it, three small erect spines are fixed near the middle of each lobe, among the glands, that effectually put an end to all its struggles. Nor do the lobes ever open again while the dead animal continues there. But it is nevertheless certain, that the plant cannot distinguish an animal from a vegetable or mineral substance; for if we introduce a straw or pin between the lobes, it will grasp it full as fast as if it was an insect."

This account, which in its way is scarcely less horrible than the descriptions of those mediaeval statues which opened to embrace and stab their victims, is substantially correct, but erroneous in some particulars. I prefer to trace out our knowledge of the facts in historical order, because it is extremely important to realise in so doing how much our appreciation of tolerably simple matters

may be influenced by the prepossessions that occupy our mind.

We have a striking illustration of this in the statement published by Linnaeus a few years afterwards. All the facts which I have detailed to you were in his possession; yet he was evidently unable to bring himself to believe that Nature intended the plant—to use Ellis's words—"to receive some nourishment from the animals it seizes;" and he accordingly declared, that as soon as the insects ceased to struggle, the leaf opened and let them go. He only saw in these wonderful actions an extreme case of sensitiveness in the leaves, which caused them to fold up when irritated, just as the sensitive plant does; and he consequently regarded the capture of the disturbing insect as something merely accidental, and of no importance to the plant. He was, however, too sagacious to accept Ellis's sensational account of the *coup de grâce* which the insects received from the three stiff hairs in the centre of each lobe of the leaf.

Linnaeus' authority overbore criticism, if any were offered; and his statements about the behaviour of the leaves were faithfully copied from book to book.

Broussonet (in 1784) attempted to explain the contraction of the leaves by supposing that the captured insect pricked them, and so let out the fluid which previously kept them turgid and expanded.

Dr. Darwin (1761) was contented to suppose that the *Dionaea* surrounded itself with insect traps to prevent depredations upon its flowers.

Sixty years after Linnaeus wrote, however, an able botanist, the Rev. Dr. Curtis (dead but a few years since), resided at Wilmington, in North Carolina, the head-quarters of this very local plant. In 1834 he published an account of it in the *Boston Journal of Natural History*, which is a model of accurate scientific observation. This is what he said:—"Each half of the leaf is a little concave on the inner side, where are placed three delicate hair-like organs, in such an order, that an insect can hardly traverse it without interfering with one of them, when the two sides suddenly collapse and enclose the prey, with a force surpassing an insect's efforts to escape. The fringe of hairs on the opposite sides of a leaf interlace, like the fingers of two hands clasped together. The sensitiveness resides only in these hair-like processes on the inside, as the leaf may be touched or pressed in any other part without sensible effects. The little prisoner is not crushed and suddenly destroyed, as is sometimes supposed, for I have often liberated captive flies and spiders, which sped away as fast as fear or joy could carry them. At other times I have found them enveloped in a fluid of a mucilaginous consistence, which seems to act as a solvent, the insects being more or less consumed in it."

To Ellis belongs the credit of divining the purpose of the capture of insects by the *Dionaea*. But Curtis made out the details of the mechanism, by ascertaining the seat of the sensitiveness in the leaves; and he also pointed out that the secretion was not a lure exuded before the capture, but a true digestive fluid poured out, like our own gastric juice after the ingestion of food.

For another generation the history of this wonderful plant stood still; but in 1868 an American botanist, Mr. Canby, who is happily still engaged in botanical research, while staying in the *Dionaea* district, studied the habits of the plant pretty carefully, especially the points which Dr. Curtis had made out. His first idea was that "the leaf had the power of dissolving animal matter, which was then allowed to flow along the somewhat trough-like petiole to the root, thus furnishing the plant with highly nitrogenous food." By feeding the leaves with small pieces of beef, he found, however, that these were completely dissolved and absorbed; the leaf opening again with a dry surface, and ready for another meal, though with an appetite somewhat jaded. He found that cheese disagreed horribly with the

leaves, turning them black, and finally killing them. Finally, he details the useless struggles of a *Curculio* to escape, as thoroughly establishing the fact that the fluid already mentioned is actually secreted, and is not the result of the decomposition of the substance which the leaf has seized. This *Curculio* being of a resolute nature, attempted to eat his way out—"when discovered he was still alive, and had made a small hole through the side of the leaf, but was evidently becoming very weak. On opening the leaf, the fluid was found in considerable quantity around him, and was without doubt gradually overcoming him. The leaf being allowed to close upon him, he soon died."

At the meeting of this Association last year, Dr. Burdon Sanderson made a communication, which, from its remarkable character, was well worthy of the singular history of this plant; one by no means closed yet, but in which his observations will head a most interesting chapter.

It is a generalisation—now almost a household word—that all living things have a common bond of union in a substance—always present where life manifests itself—which underlies all their details of structure. This is called *protoplasm*. One of its most distinctive properties is its aptitude to contract; and when in any given organism the particles of protoplasm are so arranged that they act as it were in concert, they produce a cumulative effect which is very manifest in its results. Such a manifestation is found in the contraction of muscle—and such a manifestation we possibly have also in the contraction of the leaf of *Dionaea*.

The contraction of muscle is well known to be accompanied by certain electrical phenomena. When we place a fragment of muscle in connexion with a delicate galvanometer, we find that between the outside surface and a cut surface there is a definite current, due to what is called the electromotive force of the muscle. Now when the muscle is made to contract this electromotive force momentarily disappears. The needle of the galvanometer, deflected before, swings back towards the point of rest; there is what is called a negative variation. All students of the vegetable side of organised nature were astonished to hear from Dr. Sanderson, that certain experiments which, at the instigation of Mr. Darwin, he had made, proved to demonstration that when a leaf of *Dionaea* contracts, the effects produced are precisely similar to those which occur when muscle contracts.

Not merely then are the phenomena of digestion in this wonderful plant like those of animals; but the phenomena of contractility agree with those of animals also.

Drosera.—Not confined to a single district in the New World, but distributed over the temperate parts of both hemispheres, in sandy and marshy places, are the curious plants called *Sundews*—the species of the genus *Drosera*. They are known to be near congeners of *Dionaea*, a fact which was little more than guessed at when the curious habits which I am about to describe were first discovered.

Within a year of each other two persons—one an Englishman, the other a German—observed that the curious hairs which everyone notices on the leaf of *Drosera* were sensitive.

This is the account which Mr. Gardom, a Derbyshire botanist, gives of what his friend Mr. Wateley, "an eminent London surgeon," made out in 1780:—"On inspecting some of the contracted leaves we observed a small insect or fly very closely imprisoned therein, which occasioned some astonishment as to how it happened to get into so confined a situation. Afterwards, on Mr. Wateley's centrically pressing with a pin other leaves yet in their natural and expanded form, we observed a remarkable sudden and elastic spring of the leaves, so as to become inverted upwards and, as it were, encircling the pin, which evidently showed the method by which the fly came into its embarrassing situation."

This must have been an account given from memory, and represents the movement of the hairs as much more rapid than it really is.

In July of the preceding year (though the account was not published till two years afterwards) Roth, in Germany, had remarked in *Drosera rotundifolia* and *longifolia* "that many leaves were folded together from the point towards the base, and that all the hairs were bent like a bow, but that there was no apparent change on the leafstalk." Upon opening these leaves, he says, "I found in each a dead insect; hence I imagined that this plant, which has some resemblance to the *Dionaea muscipula*, might also have a similar moving power."

"With a pair of pliers I placed an ant upon the middle of the leaf of *D. rotundifolia*, but not so as to disturb the plant. The ant endeavoured to escape, but was held fast by the clammy juice at the points of the hairs, which was drawn out by its feet into fine threads. In some minutes the short hairs on the disk of the leaf began to bend, then the long hairs, and laid themselves upon the insect. After a while the leaf began to bend, and in some hours the end of the leaf was so bent inwards as to touch the base. The ant died in fifteen minutes, which was before all the hairs had bent themselves."

These facts, established nearly a century ago by the testimony of independent observers, have up to the present time been almost ignored; and Trécul, writing in 1855, boldly asserted that the facts were not true.

More recently, however, they have been repeatedly verified: in Germany by Mitschke, in 1860; in America by a lady, Mrs. Treat, of New Jersey, in 1871; in this country by Mr. Darwin, and also by Mr. A. W. Bennett.

To Mr. Darwin, who for some years past has had the subject under investigation, we are indebted, not merely for the complete confirmation of the facts attested by the earliest observers, but also for some additions to those facts, which are extremely important. The whole investigation still awaits publication at his hands, but some of the points which were established have been announced by Professor Asa Gray in America, to whom Mr. Darwin had communicated them.

Mr. Darwin found that the hairs on the leaf of *Drosera* responded to a piece of muscle or other animal substance, while to any particle of inorganic matter they were nearly indifferent. To minute fragments of carbonate of ammonia they were more responsive.

I will now give the results of Mrs. Treat's experiments, in her own words:—

"Fifteen minutes past ten I placed bits of raw beef on some of the most vigorous leaves of *Drosera longifolia*. Ten minutes past twelve two of the leaves had folded around the beef, hiding it from sight. Half-past eleven on the same day, I placed living flies on the leaves of *D. longifolia*. At twelve o'clock and forty-eight minutes one of the leaves had folded entirely around its victim, and the other leaves had partially folded, and the flies had ceased to struggle. By half-past two four leaves had each folded around a fly. The leaf folds from the apex to the petiole, after the manner of its vernation. I tried mineral substances, bits of dry chalk, magnesia, and pebbles. In twenty-four hours neither the leaves nor the bristles had made any move in clasping these articles. I wetted a piece of chalk in water, and in less than an hour the bristles were curving about it, but soon unfolded it again, leaving the chalk free on the blade of the leaf."

Time will not allow me to enter into further details with respect to *Dionaea* and *Drosera*. The repeated testimony of various observers spreads over a century, and though at no time warmly received, must, I think, satisfy you that in this small family of the *Droseraceae* we have plants which in the first place capture animals for purposes of food; and in the second, digest and dissolve them by means of a fluid which is poured out for the purpose; and thirdly, absorb the solution of animal matter which is so produced.

Before the investigations of Mr. Darwin had

led other persons to work at the subject, the meaning of these phenomena was very little appreciated. Only a few years ago Duchartre, a French physiological botanist, after mentioning the views of Ellis and Curtis with respect to *Dionaea*, expressed his opinion that the idea that its leaves absorbed dissolved substances was too evidently in disagreement with our knowledge of the function of leaves, and the whole course of vegetable nutrition, to deserve being seriously discussed.

Perhaps if the *Droseraceae* were an isolated case of a group of plants exhibiting propensities of this kind, there might be some reason for such a criticism. But I think I shall be able to show you that this is by no means the case. We have now reason to believe that there are many instances of these carnivorous habits in different parts of the vegetable kingdom, and among plants which have nothing else in common but this.

Sarracenia.—The genus *Sarracenia* consists of eight species, all similar in habit, and all natives of the eastern States of North America, where they are found more especially in bogs, and even in places covered with shallow water. Their leaves, which give them a character entirely their own, are pitcher-shaped, or trumpet-like, and are collected in tufts springing immediately from the ground; and they send up at the flowering season one or more slender stems bearing each a solitary flower. This has a singular aspect, due to a great extent to the umbrella-like expansion in which the style terminates; the shape of this, or perhaps of the whole flower, caused the first English settlers to give to the plant the name of Side-saddle flower.

Sarracenia purpurea is the best-known species. About ten years ago it enjoyed an evanescent notoriety from the fact that its rootstock was proposed as a remedy for small-pox. It is found from Newfoundland southward to Florida, and is fairly hardy under open-air cultivation in the British Isles. At the commencement of the seventeenth century, Clusius published a figure of it from a sketch which found its way to Lisbon and thence to Paris. Thirty years later Johnson copied this in his edition of Gerard's *Herbal*, hoping "that some or other that travel into foreign parts may find this elegant plant, and know it by this small expression, and bring it home with them, so that we may come to a perfect knowledge thereof." A few years afterwards this wish was gratified. John Tradescant the younger found the plant in Virginia, and succeeded in bringing it home alive to England. It was also sent to Paris from Quebec by Dr. Sarrazin, whose memory has been commemorated in the name of the genus, by Tournefort.

The first fact which was observed about the pitchers was, that when they grew they contained water. But the next fact which was recorded about them was curiously mythical. Perhaps Morrison, who is responsible for it, had no favourable opportunities of studying them, for he declares them to be what is by no means really the case, intolerant of cultivation (*respuere culturam videntur*.)

He speaks of the lid, which in all the species is tolerably rigidly fixed, as being furnished, by a special act of Providence, with a hinge. This idea was adopted by Linnaeus, and somewhat amplified by succeeding writers, who declared that in dry weather the lid closed over the mouth, and checked the loss of water by evaporation. Catesby, in his fine work on the *Natural History of Carolina*, supposed that these water-receptacles might "serve as an asylum or secure retreat for numerous insects, from frogs and other animals which feed on them;" and others followed Linnaeus in regarding the pitchers as reservoirs for birds and other animals, more especially in times of drought; "*præbet aquam sitientibus aviculis*."

(To be continued.)

FINE ART.

EXHIBITION OF FINE ARTS APPLIED TO INDUSTRY.

Paris: Aug. 19, 1874.

The Association (Union Centrale) for the application of Fine Arts to Industry opened last Monday its fourth exhibition, held, like its predecessors, in the Palace of the Champs Elysées. This exhibition may be divided into four parts: in the nave are shown the highest class of art manufactures, such as porcelain, furniture, bronzes, stuffs, &c.; in the galleries on the first floor are exhibited the productions of the schools of design throughout France; next to these, illustrations of costume from the earliest period up to the end of the eighteenth century; on the opposite side the State manufactories of Sèvres, of Gobelins, and of Beauvais, exhibit their most recent productions in china, carpets, and tapestry.

The only part as yet entirely finished is the room containing the productions of our national manufactories. It is these, therefore, which I shall to-day attempt to describe. But first it is right to recall the claims of this Society to public attention—claims which have been laboriously and honourably acquired.

After the International Exhibition of 1851, and the report written thereupon by M. de Laborde, a general conviction was felt that Art must thenceforth be regarded as the greatest power at the service of Industry; every nation therefore determined to master these sources of our own long established preeminence. This was the origin of the South Kensington Museum, that admirable repository of art and science, of specimens and suggestions, which other nations have, without exception, endeavoured to imitate, while our old academy-ridden and conceited France still refuses a similar institution to the wants and wishes of the rising generation.

After the second International Exhibition in 1862, Prosper Mérimée, the reporter of the French section of the International Jury, published, laying aside generalities, the following cry of warning:—

"Since the Universal Exhibition of 1851, and even since that of 1855, immense progress has been made all over Europe; and although in France we have not remained stationary, we cannot conceal from ourselves the fact that our distance ahead has diminished, that it tends even to disappear altogether. While noticing the success of our manufacturers, it is our duty to remind them that a defeat is possible, that it may even be predicted in a not far distant future, if great efforts be not immediately made to preserve a supremacy which can be held only on the condition of perpetual improvement. English manufactures, which were especially inferior from an artistic point of view in the Exhibition of 1851, have made extraordinary progress during the last ten years, and if they continue to advance at the same pace, we soon may be surpassed."

This appeal on the part of a distinguished man, whose services in the cause of the preservation of our national architecture had already been priceless from the influence exerted over the Government and the public by his reports on the condition of the public buildings in France—this appeal originated the project formed by a few independent citizens of organising, in place of the Government, this Association for the application of Fine Arts to Industry. It is one of the most interesting and lasting attempts made by private enterprise during the corrupt period of the Empire.

In 1863, a few of the principal manufacturers of lace, bronzes, paper-hangings, carpets, furniture and jewellery met together, and chose for their president an active, good-tempered, energetic, intelligent and earnest man, M. E. Guichard, and subscribed the amount necessary for setting the scheme afloat. The name of their president is deserving of general esteem and attention. His profession is that of a decorative architect.

The Association set up its library and its germ of a museum at No. 15, Place Royale. It was soon joined by many artists, critics, and amateurs,

who, in exchange for their subscription of 100 francs per annum, received the title of co-founders, and the permission to use for three years the collections and library of the institution. We will pass over details in the history of the association, and mention only the principal facts. The museum received contributions of but trifling value, and want of funds prevented its increase. The library was more successful. Critics presented it with books on art, manufacturers with patterns, reviews with series of numbers, the Ministers of Public Instruction and of the Fine Arts with their great official publications. The Place Royale, situated on the confines of the Faubourg St. Antoine, the centre of skilled industry, was within reach of foremen, workmen and apprentices. But workmen are busy during the day, and the time of the children is taken up in the evening by the public drawing classes. They therefore took little advantage of the facilities for instruction and improvement which were liberally afforded to them—for after vainly attempting the plan of demanding small payments, the principle of completely gratuitous instruction had been unanimously adopted.

Evening lectures by distinguished men on special subjects attracted a small audience chiefly composed of the middle classes. When the subjects were of general interest, and treated in a popular manner, as in the lectures by M. Charles Blanc on *Æsthetics*, they were received with great applause. When the courses were technical they were delivered to benches as empty as those of the Collège de France when it is the turn of the Mantchou or Japanese languages.

The great success of the Association, the means by which it has acquired its real importance, was in the establishment of exhibitions. The general committee had the good sense and the good taste to delegate some of its power to a deliberative commission, which plays a part resembling that of the "Conseil d'Etat" in the State. It has no right to propose measures; its duty is to examine the proposals laid before it, to adopt, amend, or reject them. At the outside it may venture to suggest an idea, which is not adopted until acknowledged as practical in principle. To this commission we owe the plan of organizing exhibitions of art both ancient and contemporary. The most remarkable, and at the same time the most useful of these glimpses into the past and the foreign, was that of 1869, which was devoted to Oriental productions—of Turkey, Peru, India, China, Japan, &c.

To the Committee, whose decisions are received with the most courteous deference, we also owe the important enquiry into the present state of the schools of art and design. When first invited by the Association to contribute, the specimens of the schools of design from all parts of France were so feeble, so ridiculous, they outraged to such an extent every rule of art, that there was a general cry of horror. It was then that for the first time the depth was measured of the abyss into which we had fallen since the end of the eighteenth century. The great Revolution, when it broke up the old guilds on the ground that they interfered with individual liberty, instituted a new order of things which the tyranny of the First Empire prevented from assuming a definite form. Art when it became a part of the official administration no longer reached the mass of the people, its models lost all originality, and were satisfied with following the last fashion and the last book. First came the style of the Empire with its consular fasces, then that of the Restoration with its imitations of knights and troubadours, followed by the style of Louis Philippe with its Romantic mouldings. In this deplorable confusion there was lost the tradition of thorough professional teaching (not that which is given only for a few hours in a class in front of a black curtain, but the training which is imbued in a studio, by the fireside of one's own home, or that of one's master, during the long

years of apprenticeship) which constituted our strength in former times.

Our exhibitions of works from the schools of design have not as yet solved this great problem of modern times, but they have encouraged its study by demonstrating its urgency. They have roused the old teachers. They have occasioned the foundation of new or the radical reformation of old schools of design in the great industrial centres, such as Lyons, Limoges, &c. They have stimulated a demand for new models less feeble than those which the scholars were made to copy literally, just as they were forced to learn by heart antiquated maxims without life or spirit. The progress made has been evident and marvellous. The difference between the specimens of this year and those of 1869 is really wonderful.

The Committee has also instituted competitions. Prizes are given to the artists or manufacturers who have best solved certain difficulties. Practically, no great results have been obtained. On another occasion I will recur to this subject. Hitherto all the interest has lain in the intelligent care with which these tasks are set. The French mind is not yet accustomed to a method which does not particularise every detail, and which leaves an opening to original genius and invention. In this, again, we are the victims indirectly of the official teaching of the Academy of Fine Arts, which admits of no divergence from rule.

Although the chief attraction for the public consists in the retrospective exhibitions of this society, its real benefit is derived from the exhibitions of contemporary productions. In these we see the effects of the direct impulse which has been given. Works of this kind—refined in conception, execution, form, and colour,—are lost in academical exhibitions. Here their real value is discussed and appreciated. Our medals are sought after because they are awarded by competent juries, over whom it would be difficult to exercise pressure. We have never received one serious appeal.

The society has been joined this year by some important members in a social point of view. M. Barbédienne, whose beautiful bronze reproductions are well known, and M. Denière, President of the Chamber of Commerce in Paris, have each hired a large space, which they intend to adorn with their finest works. This practical adhesion of the higher commerce needs no commentary.

Another great fact is the reception of the productions of many artistic tradesmen who did not choose to send their works to the International Exhibition at Vienna. Among them are M. Froment Meurice, a jeweller whose reputation is European, and the brothers Fasinières, bronze-workers of the first class.

A great proportion of the cases are filled with pottery. Here, too, a great progress is perceptible. It is a pity that we cannot compare the beautiful productions of the brothers Deck, for instance, with those of Minton. But the brothers Deck have at the present moment formidable rivals in France. I cannot help dwelling upon the attractions and interest of this reviving department of Art as applied to industry.

Lastly, our State manufactures exhibit their produce side by side with that of private firms. I intended to have taken my reader through these galleries, but I have been tempted to digress, and the end of my paper warns me that it is time to conclude.

PH. BURTY.

THE EXHIBITION OF COSTUMES AT PARIS.

Paris: August 17, 1874.

The fourth exhibition of the "Union Centrale des Beaux-Arts appliqués à l'Industrie" was opened on the 10th instant, by the President of the French Republic. The exhibition is held in the Palais de l'Industrie, and is divided into three groups: the modern productions of art industry,* the drawings and models of the schools of art of

Paris and the departments, and a retrospective exhibition presenting a history of the costumes of all nations from the earliest periods to the end of the eighteenth century, illustrated either by the costumes themselves, or by pictures and other works of graphic and plastic art in which these costumes are represented. The Modern Exhibition occupies the ground-floor of the building, the retrospective history of costume the rooms of the upper. It is with the latter we have to deal.

The classification employed by M. Henri Longpérier is geographical: Japan, China, and the extreme East being placed in the rooms on the right, the American peninsula on the left, Europe in the centre. Six rooms are assigned to France, corresponding to the different historical periods. The Gauls, Franks, and Carolingians are in one room; then follow the different centuries to the Renaissance, and the Valois Kings and the Bourbons, Louis XIII. to Louis XVI. All the rooms are hung with tapestries illustrative of the various epochs. In the room devoted to the sixteenth century there are few contemporary vestments, but an admirable collection of paintings and embroideries with costumes. Two curious oval pictures in needlework represent, one a stag hunt, the other bear-baiting, in which latter Diane de Poitiers is to be seen extending her staff, desiring that an unfortunate dog should be rescued from the hug of the bear. Another, already exhibited by M. Jubinal in the South Kensington Exhibition of Art Needlework, has for subject the visit of Henry III. and his queen to a lady for whose infant she is to stand sponsor. In this, and two others of similar date, the costumes are perfect, as also in the needlework back and seat of a large sofa in its original plainly turned wooden frame, the ladies wearing enormous Medicean collarettes, the men the padded hose. A curious doublet is here shown, of steel plates, covered with brown velvet, evidently used for protection against assassination. A charming terra-cotta statuette, the dress heightened with gold, gives the costume of an Italian lady of the Renaissance. The ecclesiastical vestments in this room are very rich. A crimson velvet cope, embroidered with seraphim, fleurs-de-lys, and eagles; one of black and gold, of similar design and a kind of green velvet; one of blue satin, with rich Italian scroll border, the pattern cut out and applied in yellow and white satin. In the centre of the room is a group of armour, and the cases are filled with smaller objects of jewellery, enamels, and metal work.

The room of Louis XIII. is again remarkable for the costumes, pictures, and busts illustrative of the period: among others a series of paintings, with subjects resembling the engravings of Abraham Bosse, but totally devoid of the costumes themselves. Here, too, is a most splendid set of furniture for a bed, of the richest tapestry, partly executed on the frame, partly by the needle. In the scalloped valance, figures are introduced into the pattern.

The Louis XIV. room is hung with a tapestry, representing the appropriate subject of the King's visit to the manufactures of the Gobelins, conducted by Colbert. Other tapestries on the top of the stairs, representing various incidents of his reign, are admirable for the costumes; but it is much to be regretted that so few of the actual garments have been forthcoming. There are none earlier than the eighteenth century, and none of historic interest.

The eighteenth century brings us to the time of Louis XV. and Louis XVI., when the extravagance of dress was at its climax. This is the only period which is not scantily represented, and nothing can surpass the magnificence of the men's dresses, of the richest velvets, flounced silks and satins, embroidered with massive gold and silver, pearls, and tinsel (cliquant) of brilliant metallic hues, or of the ladies' sacs of equally rich satins and silks. It is a pity some "dummies" could not have been dressed, to exhibit these coats, waistcoats, &c., to full advantage; but the difficulty

has been in procuring the head-dresses corresponding to dates, and the unwillingness to exhibit in order to complete the costume of any vestment not in its original state.

Supplementary to this series is a room assigned to the collection of ancient textiles, formed by M. Dupont Auberville, whose fine historical collection of lace calls forth so much interest in our International Exhibition of this year. His textiles range from the tenth to the eighteenth century. In those of the tenth and eleventh the patterns are so effaced by age that a tracing is given by the side of each. Next follow the Italian tissues of the thirteenth and fourteenth centuries, of Asiatic type, the patterns consisting of animals opposite each other (affronted) in silk and gold. The fifteenth still preserves the Oriental style, velvets woven with gold and silver, silk brocatelle copied from the looms of Constantinople. The beginning of the sixteenth century exhibits a magnificent cope of cloth of gold—such a tissue as may have been worn by Henry and Francis on the field of Ardres. Then, with Henry II., a transition takes place; the patterns are small and geometric, silks for female costume, striped velvet for the padded hose. M. Dupont exhibits a short velvet mantle of the time of Henry III., *à crevés*, as it was called, from the perforated holes which formed the pattern and showed the doublet of silk underneath, and a fragment of the dress of Margaret of Valois, sister of Francis I. In the seventeenth century the manufactures of Lyons and the "gros de Tours" appear, creations of Colbert; large patterns of trees, pomegranates, &c. With Louis XV., the Chinese taste came in, pagodas, bridges, boats, China men and China women. Then follow the ribbon or "rivière" patterns, succeeded by medallions, which continue on to the Consulate and the Empire.

In the centre of this room is part of the vast collection of shoes formed by M. Jules Jacquemart, so well known by his brilliant aqua-fortis engravings, the "poulaines" and square toes of the sixteenth century, the raised "patins" of the Venetian ladies, "talons rouges" of the eighteenth—shoes in every variety. The series is continued in the Oriental room, and here the shoes of the Empress of China figure among the most diminutive. M. Jubinal contributes a collection of gloves.

The Oriental room is highly interesting. The Chinese dresses mostly bear the imperial insignia of the five-clawed dragon, yet cannot all have belonged to the emperor himself, the yellow always excepted—probably the members of the imperial household are allowed to wear this distinctive pattern. The Japanese costumes are even more splendid and also of the richest colours, some of them bearing the armorial insignia of the nobles of Japan. One of blue satin has the sacred "tailed" tortoise embroidered all over in gold. A white dress has the imperial insignia of the "guikmon" or chrysanthemum; another, black, is covered with the bat and other fantastic animals; and a yellow satin is sprinkled with fans. There are some fine pieces of Chinese embroidering on satin of the time of Louis XIV., one representing Pousa, the god of contentment, with the peach of longevity in his hand. Another Chinese divinity has the avis deer, also emblem of long life, by her side. The central case is filled with curious objects from China and Japan;—a series of Japanese theatrical wooden masks of extraordinary lightness, the different expressions of the countenances wonderfully given, Japanese dolls, armour, grotesque helmets, and various other curious objects of oriental workmanship.

Another room contains the costumes of Greece, with the leathern embroidered jacket of Wallachia. Hungary, Egypt, &c., another, the costumes of Spain and Mexico, rich in gold and silver, but these divisions are not completed, and it will be yet some time before the whole is finally arranged and ready for the catalogue of its contents.

It is a most novel and interesting exhibition, and reflects great credit on its originators and on

* See M. Burty's article above.

the exertions of the members of the Union Centrale in bringing the collection together, and in having turned to the best advantage the resources at their disposal.

F. BURY PALLISER.

NOTES AND NEWS.

IN connexion with the recent meeting of the medical men in Norwich, there was held in St. Andrew's Hall, in that town, an exhibition of pictures, open but for a very short time, but of unusual interest and value. The object of its promoters was to bring together as many works as possible of the Norwich school of landscape painters, and there was a goodly array of pictures by Old Crome, John Burney Crome, John Sell Cotman, Stark, Vincent, Thirtle, and others. One of the greatest Cromes was that called *The Willow*, the property of Mr. G. Holmes. Some fifty years ago it was sold by auction for 8*l*. During its sojourn at the recent exhibition it was insured for 1,000*l*. The pony introduced into the foreground of this picture was copied from a work of Hobbema's, in which Crome took special delight. The trustees of the late Mr. Hudson Gurney—who was among the helpers of John Crome—lent a remarkable work, *A View on the Paris Boulevard*, the result of a brief visit Crome paid to France in 1814. This picture was exhibited by the local (Norwich) Society of Artists in 1815. Of Cotman's work there was specially to be remarked a sea-piece—*Gale at Sea*—from the collection of Mr. T. J. Mott. Mr. John Gunn lent a most exquisite example of this master, called *The Silent Stream*: vari-coloured foliage drooping over water. A carefully prepared catalogue by Mr. J. Reeve, of Norwich, added interest and value to the gathering of works of the Norwich School.

THE little church of Birley, in Herefordshire, was re-opened on Thursday, August 20, after having undergone very thorough restoration. The attention of some local archaeologists was called to the work at an early period, and to their efforts is due the preservation of the chief features which rendered the ancient fabric interesting. In these must be included an Early English chancel arch of considerable beauty and a south chapel in the Decorated style to which a history is attached. Two centuries ago it contained in one of its windows the arms, encircled by a garter, of Burley, and we learn from the antiquary Blount that in his time there was "an ancient gravestone with the same arms as in the chapel windows." If we are to understand by this expression that the insignia of the Garter were on the tomb as well as in the window, we may perhaps infer that both were intended to commemorate Sir Simon de Burley, K.G., who was beheaded on Tower Hill, May 15, 1388—a victim either to the envy of the Duke of Gloucester, or to the arrogance of his own conduct. It is at least certain that this little parish was held under the Mortimers by the Burleys, and that the latter family was one of the most important in the fourteenth century. Walter de Burley, "*doctor perspicuus*" and tutor of the Black Prince, Sir John, Sir Simon and Sir Richard de Burley—all knights of the Garter—were among its most eminent members.

THE great gallery of the Louvre facing the banks of the Seine, after three years' work, will be shortly opened to the public. Its whole length is 700 metres. Rubens' *History of Queen Marie de Medicis* occupies one-fourth of the gallery, which will be filled with paintings by masters whose works have hitherto not found a place in the collection.

THE church of Ste. Eustache, a most important monument of the sixteenth century, devastated in the reign of Terror, and considerably damaged during the Commune, is now completely restored, a few white stones in the old blackened walls alone remaining as evidences of civil war.

THE parish church of High Wycombe—the largest and perhaps the finest edifice of its kind in

Buckinghamshire—is about to undergo restoration at the hands of Mr. Street, R.A. The estimated cost of the proposed works exceeds 10,000*l*. The church was erected in the reign of Edward I., and the tower, of unusual dimensions and character, was added in 1522. The chancel window has long been wholly concealed by the picture of *St. Paul Preaching to the Britons*, which was painted by Mortimer, in 1764, and gained the prize of the Society of Arts. We presume this work of questionable art will give place to a suitable reredos.

THE east side of the International Exhibition building has been let, it is stated, to the India Office, at a rental of 2,500*l*. per annum, for the purpose of exhibiting the contents of the India Museum, hitherto displayed at the top of the India Office. Some time ago it was reported that a new India Museum was about to be built opposite the India Office, with reading-rooms and every convenience for students; but this plan, we suppose, is now given up, unless the exhibition at Kensington is to be only temporary. It is not known as yet how the remaining space of the International building will be utilised.

MR. THOMAS STEWART SMITH, an artist and collector, has recently bequeathed a sum of 20,000*l*. to Stirling, his native town, for the purpose of founding a fine art institution. During his lifetime Mr. Stewart Smith collected a large number of paintings with this view, but his death prevented his carrying out his plans. A building has now been erected in the Italian style of architecture, with a fine-art gallery 105 feet long.

A REMARKABLE polychromatic monument has recently been raised in Florence to the memory of a young Indian prince who died in that town in 1870, on his way back from England to his native land. His body, according to his own desire, was burnt on the banks of the Arno, and this monument has been erected by his friends on the spot where the strange funeral rites were celebrated. The mausoleum is of oriental style of architecture, its chief feature being a coloured bust of the young prince, said to be a good likeness. An inscription in English, Italian, and two Oriental dialects on the four sides of the monument, states that it was erected "to the memory of the Indian Prince Rajaram Chuttraputti, Maharajah of Kolhapur, who died in Florence, at the age of twenty-one, on the 30th of November, 1870." Charles Mant, Captain R.E., and an American sculptor, Mr. C. F. Fuller, are the artists of this unusual monument.

THE *Graphic* relates that an important painting by Rubens has recently been discovered at San Francisco of all places in the world. It represents Diana and Nymphs, and is said to be, with how much truth we cannot tell, a painting by Rubens that is known to have been lost. Its American history begins at a pawnbroker's at New York, from whence it was brought to San Francisco, and raffled for 700*l*. The winner obtained it by purchase for 260*l*. and took it with him to Sacramento, where for some time it figured in the saloon of a Frenchman. It was next bought by the manager of the Forrest Theatre at San Francisco, and fortunately escaping when that theatre was burnt down, was transferred to the Folsom. After this it again turned up at Sacramento, forming the chief adornment of the railway saloon of that town, from which place it has finally been removed to its present more suitable locality in the Art Association rooms of San Francisco.

The *Graphic* unfortunately does not state its source of information for this interesting history.

THE Belgian Fine Art Exhibition at Namur is reported to be far above the usual level of provincial exhibitions. The *Indépendance Belge* considers it "the most important that has ever been held in the Belgian provinces." Some of the best-known names in Belgian art may be found in

its catalogue, but it is said that a lady, Mdle. Beernaert, bears off the palm in landscape-painting. Her paintings of the *Environs de la Haye* and *L'Escaut, Environs d'Anvers*, have attracted much notice and admiration. The same lady has a fine landscape in the Spa Salon.

AN exhibition of the works of several of the most distinguished Belgian sculptors is now open at the Fine Art Academy in Brussels. An exhibition of modern Belgian paintings may also be seen at Ghent in the large rooms of the Casino.

A MORE serious injury than that which we recorded a short time ago (ACADEMY, August 15) as having happened to two of Rubens's paintings in the Brussels Gallery, has just befallen one of that master's largest paintings, the colossal *Assumption of the Virgin*, belonging to the town of Düsseldorf. This picture is painted on wood, and recently two great cracks, the biggest wide enough to admit of the introduction of a finger, have appeared in the panel. To add to the misfortune, one of these deplorable fissures goes right through the charming head of the Madonna. The injury is attributable to the variable temperature of the gallery. It had been very damp for some time, and became too suddenly heated when the hot weather set in.

THE *Turkistan Gazette* announces that a small terra cotta pitcher has been dug up in the marketplace at Tashkend, containing silver coins of the time of Sultan Sandjari-Maza, who reigned before Tamerlane.

THE *Italia* announces that the superintendent of the excavations at Rome has just purchased, for 200,000 francs (8,000*l*.), three magnificent mosaics found at Baccano, on the Via Cassia, on property belonging to Count Gentili. These mosaics form the pavement of an ancient villa on its site. The mosaics are broken, but certain parts form complete pictures. The most important are those representing the drivers of the Circus, each holding in a horse, and dressed, like jockeys of our day, in various colours—white, red, blue, and green. Their head-dress is not unlike the modern jockey cap. The other pieces represent the Rape of Ganymede, Ulysses issuing from the Cave of Polyphemus, and a scene from the *Iliad*. The mosaics will shortly be exhibited in the Palatine Museum.

THE *Pungolo di Napoli* of August 7 states that among the objects lately found at Pompeii is one which has awakened the curiosity of archaeologists—the military discharge of a soldier of the fleet of Misenum, which formed part of the colony of veterans established at Paestum, inscribed on two tablets of bronze, tied together, and signed "S. L. Basso." It is said to belong to the period of Vespasian.

AT the annual meeting of the Royal Lombard Institute, which took place at Milan on the 7th, the bust of Carlo Possenti, one of its late members, and the statue of Count Pompeo Litta, were solemnly inaugurated. The statue of the author of the *Famiglie Celebri Italiane* is by Francesco Barzaghi, and represents him standing, wrapped in his cloak, some papers in one hand, and at his feet his sword, for he was a soldier, and some of his celebrated works.

A MARBLE medallion of Adolphe Nourrit, the celebrated tenor singer, has just been placed in the gallery of Versailles by the side of the busts of Grétry and Talma—a just tribute to a talented artist, and a high-minded man.

A REMARKABLE painting by Henri Rigaud, the *Presentation in the Temple*, has just been placed in the French Gallery of the Louvre.

THE death is recorded of M. Lancrenon, a French painter of some reputation. Lancrenon was the pupil, and afterwards the friend and collaborator of Girodet. He was born in 1794, and achieved his first success in 1816, when he carried off a second prize by his picture of the Death of

Paris. Soon after this one of his pictures was bought by the State and placed in the gallery at Fontainebleau, and about the same time he was employed to paint the ceiling of a gallery in the Tuileries with a mythological subject. Two of his most popular pictures, the *Fleuve Scamandre* and *Alphée et Aréthuse*, were exhibited in 1824 and 1825, but they made a reappearance at the French Exposition in 1855, and have since been lithographed. They are now in the Museum at Amiens. As a designer, even more than as a painter, M. Lancrenon had a long established reputation. The *Chronique* states that he was the first person who made a drawing of the Venus of Milo. It is also stated that the Museum at Besançon owes its foundation to him, as well as the school of design in that city. In 1860, at the close of the Bisontine exhibition, he was named Chevalier of the Légion d'Honneur and correspondent of the Académie des Beaux-Arts. MM. Giacomotti and Machard are among the most distinguished of his pupils.

In the *Gazette des Beaux-Arts* for this month, the Salon again occupies a large space, but two articles are also devoted to the Retrospective Exhibition of the Palais Bourbon, which, strange to say, has not been reviewed before in the *Gazette*. "Chose horrible à penser," Paul Mantz admits, "les grands maitres ont failli attendre." For two months the poor tried critics have been obliged to fulfil the function of *Salonniers*, and have been doomed to the perpetual study of modern works.

It is with evident relief that Paul Mantz now turns to the old masters who have been waiting so patiently for his notice, and finds "all the tenderness, all the poetry of the fifteenth century" in an "adorable" Virgin and Child by Piero della Francesca, all the "naïveté of heart and childlike grace of Raphael" in his celebrated *Vierge de la Maison d'Orléans* and all the excellence of Venetian painting in the work of the "valiant portraitist" of Bergamo, Giovanni Battista Moroni. In another article Albert Jacquemart reviews and describes the pottery, glass, ivory, carvings, and metal work of the Exhibition.

Paul Baudry has an enthusiastic expounder in René Menard, who devotes a third article to the decorations of the new Opera House. One of these, a small wall-painting of the Judgment of Paris, has great beauty and classic grace. It is reproduced by photography from Paul Baudry's own drawing, and several other wood-cut illustrations are given of his works. It is impossible, however, to judge of the effect of his large wall and ceiling paintings from these small outline engravings.

A notice of the recent Exhibition of Embroidery at the South Kensington Museum; a critique on the English Royal Academy; three poems by Jules Breton, who can write poetry as well as paint it; and a capital etching by Unger of the *Delft Family*, a Dutch painting in the Royal Academy at Vienna. Unger's etching appeared some months ago in the *Zeitschrift für Bildende Kunst*; the original painting was then, if we remember rightly, assigned to Jan van der Meer van Delft, but it is now claimed by C. Vosmaër, who is a great authority on such matters, for Pieter de Hooghe. It formerly went with the name of Terburg, but it is quite unlike that master's usual work. The picture represents a sedate old Dutch family assembled in a quaint little garden behind their house. The three venerable members of the household partake of fruit laid out on a small table, two young men stand on the steps of the house, while a young man and woman stand apart, evidently enjoying the consciousness of having their portraits taken. Except for the puritanical Dutch costume, and certain artistic effects of light and shade, it is just such a family group as the photographer composes at the present day.

THE STAGE.

"THE SPHINX" IN ENGLISH.

The Sphinx, which was produced last Saturday at the Haymarket, is not likely to be very successful in England, for an English audience is sure not only to be quite alive to its faults, but a little blind to its merits. It is full of talk—the discussion of things—and an English audience hates the discussion of things. It has hardly any real comic force, and an English audience enjoys pure comedy, and has a right to do so. On the other hand, it has the merit of presenting one character—that of Savigny's wife—somewhat too fine for our common comprehension. We call her inconsistent when she distinguishes between bearing a social wrong which she is supposed to be ignorant of, and bearing that wrong when her knowledge of it is evident to those who have no right to inflict it. As long as she suffers silently she has not quite got our sympathy; and when she orders her rival away, we wish that she had done it sooner, and give her credit hardly more for wisdom than for forbearance. The contrast too, between this nature of Berthe's, which knows how to wait, and that other of Blanche's which knows only how to act and to despair, is rather lost upon us; and we see in the whole play only an elaborate contrivance of the author to lead up to a great death-scene which we have heard much talked about—the truth being that the prominence given to the death-scene probably annoyed no one more than M. Feuillet himself, who had quite other intentions, but who found, a little late, that in dealing with Mdlle. Croizette for an interpreter, he was dealing with a young lady who knew her own mind and was not altogether unaccustomed to follow it. But the contrast between these two characters is really at the root of the play, and of the novel which suggested the play. On the one hand, the physical strength, the physical courage of action, even when the action is self-destruction, when it saves nothing and accomplishes nothing but oblivion: on the other hand, the mental strength, the moral courage, of abnegation. Of course the contrast has not been perfectly portrayed by M. Feuillet. The piece is marred by many faults, positive as well as negative. But the interpreters of the piece, at the Français, understood the contrast and took pains to present it. Pitter representatives of the two characters than Mdlle. Croizette and Mdlle. Sarah Bernhardt could not anywhere be found. When Mdlle. Favart acted Blanche, here in London, the contrast, it seems, had already partially disappeared. They say that Mdlle. Favart made Blanche de Chelles a wily courtesan, instead of a reckless woman playing wildly for high stakes of which she doesn't know the value.

Something of this original contrast, so plainly marked by Mdlle. Croizette and Mdlle. Bernhardt, was evidently intended and partially attained last Saturday at the Haymarket by Mdlle. Beatrice and Miss Moodie. But Mdlle. Beatrice seemed scarcely to grasp a character in which reflection has no place at all; in which no moment intervenes between the conception of an act and its execution. She wants Croizette's absolute promptness and absolute decision. She fumbles too much over the poison in the ring. It is only a few seconds more or less—very true—but the few seconds are enough to make the difference. Earlier in the piece, she has caressed the ring too often—has too often doubted whether or not "to ask from her Sphinx her secret." A thing of sudden moods, too, Blanche's manner to Berthe, when she has swallowed the poison, does not change quite sharply enough. Croizette was all defiance at one moment; all contrition and despair at the next. But if Mdlle. Beatrice's performance does not show all the mastery over a particular character which is almost peculiar to Croizette, it shows much of intelligence and earnest workmanship.

The gentleness, the delicacy, the domesticity

of Berthe's character is seized and rendered by Miss Moodie very well, and yet not perfectly. Beyond the indication of these traits Miss Moodie does not go; and those who have seen Mdlle. Bernhardt miss all the depth of controlled trouble in the slow and quiet phrase that follows the discovery of her husband's passion for Blanche—phrase that falls quite flat at the Haymarket—"Ah, c'est plutôt moi, qui voudrais mourir!" And where is the high womanly dignity that accepts the probability of the husband's flight with Blanche, and answers to the taunt of it, "Mon malheur ne serait pas plus grand—il serait plus digne." Moreover, Miss Moodie's representation, though entirely free from offence, is somewhat lacking in easy and unregarded grace and in social distinction.

Mr. Wenman makes of the Admiral a more pleasing figure than Maubant; but then, in doing so, and in giving only the chivalrous side of this bluff sailor's character, he appears to forget the tradition as to the Admiral's fierceness—the story how he would have shot his first wife, if he had not happened to have missed her. Mr. Frank Harvey plays Henri de Savigny very discreetly and competently. He looks a less sickly husband and lover than Delaunay, but he is of course without Delaunay's experience and stage culture at the highest of theatres. The frigidity of the Scotch peer, Lord Astley, is no doubt conceived by our neighbours to be typical. Mr. Dewhurst enters too much into the character, such as it is meant to be. It is a caricature, at the best, and an enigma, besides; but it is unnecessary to represent our typical peer as expressing himself on social questions in the tone of a very wearisome preacher, and making illicit love with the cold dignity of a court ceremonial. Among the minor characters it may be mentioned that as Lajardie—the very prosperous young French bachelor, who beams with *bien être*, and would be more demonstratively delighted with himself if he were not also so entirely satisfied with everybody else—that as Lajardie, I say, Mr. Carter-Edwards has not the freedom and carelessness of Joumard, though his acting is by no means without point and intelligence; and, to finish, that Mr. Andrews contrives to be very amusing as the enraptured pianist—the merit would perhaps be greater if he did not limit himself so completely to the reproduction of the head and gestures of the younger Coquelin. The piece, one ought to add, is capitally translated. The tone, the thought, the life, are genuinely French—whether for good or ill—and the fact that the story is so entirely untampered with will give a little interest to the problem of how far it will succeed.

FREDERICK WEDMORE.

WE hear with regret that Mr. Charles Thorne, the American comedian, whose engagement at the Gaiety closes to night, will almost immediately leave our shores.

WE understand that Miss Fowler will play the leading heroine—that is, the blind girl—in *Two Orphans*, at the Olympic, and that Mr. Henry Neville will play the cripple. These are two parts made very famous by their striking representation in Paris. There is another most important part which might have been designed for Mrs. Alfred Mellon, so completely, we believe, do her powers fit it. Who will play it is as yet unfixed.

Janet Pride has proved attractive enough, at the Princess's, for there to be no further mention of the *Willow Cope*. *Lost in London* is promised to our provincial visitors, instead. With Mr. Emery, Mr. Belmore, and Miss Foote in the cast, it will not be badly supported.

THE Vaudeville did not close last Saturday, as it was at one time announced to do. *Old Heads and Young Hearts* and *Creatures of Impulse* continue to be performed, though next week there will probably be some changes in the cast of the comedy, from which, as our readers know, Messrs. James and Thorne, and Miss Amy Roselle have for several weeks been absent.

THE last nights of *Clancarty* are announced at the Olympic, but there has recently been such a change in the cast as to constitute almost a new performance. Only two important parts, if we recollect aright, are now played by their first representatives. Mr. Vollaire is still Lord Portland, and Mr. Sugden (*alias* Charles Neville) is still William III. His acting, which we mentioned with special praise several months ago, remains among the best that is to be seen in London. There is nothing but the too apparent youth and vigour of the voice with which fault may reasonably be found. It is a pity this is not more thoroughly controlled and subdued, for, if it were, then Mr. Sugden's performance, which is already entirely artistic in intention, would be most absolutely satisfactory. Mr. Vernon has assumed Mr. Henry Neville's character, of *Clancarty*. He plays it without Mr. Neville's buoyancy, but with sterling qualities of his own. Miss Ada Cavendish—never quite at home in the part of Lady *Clancarty*—has, in abandoning it to Miss Carlotta Addison, given it to a lady who plays with less courtliness; with greater simplicity and directness. Miss Fowler has resigned the part of Lady Betty Noel in favour of Miss Marion Terry, who makes a marked advance in her profession by the care, delicacy, and sharpness with which she represents the character.

MR. IRVING has been acting at Liverpool during the present week.

A COMPANY organised by Mr. Frederick Wright for the performance of Mr. Farnie's popular *Nemesis*—and having the sole right to perform that piece in the provinces—has this week been giving a very creditable representation at the Theatre Royal, Norwich. Among the principal members of the company are Mr. H. Bicker and Miss Rose Temple, from the Gaiety, who acquit themselves very pleasantly, in the parts "created," we believe, by M. Marius and Miss Bromley.

MR. BARRY SULLIVAN is going to America.

The Broken Branch, which, as its name clearly indicates, is an English adaptation of M. Gaston Serpette's comic opera, *La Branche Cassée*, was produced at the Opéra Comique on Saturday night; the principal characters being played by Miss Laverne, Miss Rita, and Mr. Chatterton.

THERE has been nothing new at the French theatres during the last week or so. *Mademoiselle de Seiglière* has been revived at the Théâtre Français for the *rentrée* of Mlle. Croizette.

DID Molière ever eat with Louis the Fourteenth? One of Ingres's worst pictures, and one of Gérôme's best, are devoted to the perpetuation of the legend that he did; but perhaps the need for such a story occasioned the supply of it: the character of the Grand Monarch would hardly have been complete if he had not given his courtiers a lesson in humility, worthy of Canute himself. For that is what it really was, if it was anything at all; but far more probably the thing never happened. So at least thinks M. Eugène Despois, who, in his book which was noticed in the ACADEMY last week (*Le Théâtre Français sous Louis Quatorze*) has gravely discussed the question. The legend, he remarks, is rather a young one for a legend of the time of Louis Quatorze. It is only fifty years old, having first appeared in 1823, in the *Mémoires* of Mme. Campan. She had the story from her father-in-law—so she said—and he, for his part, had it from an old doctor who was physician-in-ordinary to the Grand Monarch himself. The doctor must have been marvellously young when he received it (or when he was physician-in-ordinary), and marvellously old when he imparted it. There is another story, but that was set down in writing at the time, that Louis received at his table the wife of the director of the Garden of Plants—one Mme. Vallot, whose husband had offered to the monarch a luncheon of fabulous costliness, which moved the sovereign to this gracious and delicate return. But that, of course, is quite another

business, or, as an argument, can be turned either way, for "see the gracious condescension of the monarch!" say some, who believe in the story about Molière; while others say that as this deed of Louis's was chronicled at once in proper form, so would the king's extraordinary attention to Molière have been had it ever occurred. Moreover, the extreme improbability of any such act to a comedian is to many the best reason for disbelieving it. Not before the end of the siege of Namur did Vauban, to whom Louis owed so much, eat at his table. The clergy were excluded, unless they were bishops or cardinals. Now, at that time, would Molière have received a distinction denied to Bossuet? "Ailleurs qu'à l'armée," says Saint-Simon, "le roi n'a jamais mangé avec aucun homme"—a sentence that might have been written prophetically, to contradict the story. That is enough for M. Despois, who finally answers the question in the negative; but as no chronicler has ever watched a monarch at every moment of his life, and as nothing is certain but the unforeseen, and as no privilege of royalty in times past has been seized more readily than the privilege to be unconventional and whimsical without reproach, French literature of gossip may, we imagine, still keep its story, and the Théâtre Français its picture—which hangs in a place of honour in the green-room, and, if not a record of encouragement bestowed on art, may be at least an incentive to it.

WE may refer our readers to the last number of the *Revue des Deux Mondes* for a very detailed account of the Theatre in Japan. Not only are the conditions of the performance described, but there is a long analysis of the pieces presented. Here we have only space to give one or two little facts. There are several theatres in Yeddo: those of Shimabara and of Naki-Bashi, situated in the middle of the town, attract chance audiences, which are not always the best: that in the suburb of Asakusa is the *rendezvous* of fashion. In London and Paris you dine an hour earlier than usual if you want to go to the theatre; but in Japan you have to get up earlier, for the play will begin at six of the morning, and will last the livelong day. Nay, there are pieces which last three days. The audience returns to its work with the patience and perseverance of a member of the British Association. Music beguiles the time. It is played during the long *entre-actes*, and it accompanies in nearly all cases the recitation of the piece itself. The spectators face each other and not the stage, of which they have but a side view. They sit in boxes, and each box holds four people. Among the players there are no women. Young men well draped impersonate them. The men themselves are accorded only the very lowest social position, and yet, strange to say, at their death they are rewarded with the tears of the town. A long procession forms part of the funeral arrangements. They are popular favourites or lamented playthings, but no celebrity ever gains for them admission into the good society of Yeddo. Good society may visit them; but they are never allowed to return good society's call.

MUSIC.

COMPOSITIONS BY EDVARD GRIEG.

- Humoresken für das Pianoforte*, Op. 6. (Leipzig: Peters.)
Sonate (E moll) für das Pianoforte, Op. 7. (Leipzig: Breitkopf und Härtel.)
Sonate (F dur) für Pianoforte und Violine, Op. 8. (Leipzig: Peters.)
Sonate (G dur) für Pianoforte und Violine, Op. 13. (Leipzig: Breitkopf und Härtel.)
Concert für Pianoforte und Orchester, Op. 16. (Leipzig: E. W. Fritsch.)

MODERN composers may be divided into two classes—those whose style is founded more or less directly on some one or more of their predecessors,

and those who have a distinct individuality of their own. The former, it need scarcely be added, outnumber the latter in the proportion of, perhaps, hundreds to one. Not to speak of the swarm of mere imitators, the disciples of the Mendelssohn school are legion; even Brahms and Raff, great as they are, especially the former, owe much to Schumann; while in music for the pianoforte, such for example as that of Rubinstein, the influence of Liszt is often unmistakeable. It is an interesting fact that so many among the most original of modern composers should have come from northern countries. Chopin, the embodiment of Polish music; Gade, in whom, with many traces, not to say reminiscences of Mendelssohn, is to be found a northern colouring, due doubtless to his Danish birth; and, lastly, the two Norwegian composers, Svendsen and Grieg, all illustrate the correctness of this assertion. Of Svendsen's music we have already spoken on the occasion of a performance of his Octett (see ACADEMY of March 7); to-day we propose to direct the attention of our readers to some of the works of Edvard Grieg.

This young composer was born at Bergen in the year 1843. His published works number at present about twenty. Of these many are printed in Norway, and are not therefore easily to be met with in this country. These consist, for the most part, of small pieces; his most important compositions are those the names of which are at the head of this article; and from these it is possible to form a fair estimate of the character and limits of his genius.

The first thing which will strike a musician on making their acquaintance is their intense and absolute novelty. It is really refreshing to meet with anything so far out of the beaten track. Some of the music is, indeed, so excessively original that its beauty hardly strikes one on a first hearing. Its great individuality arises from its strong northern character, and the ear requires to be somewhat accustomed to the unusual melodic progressions and strange rhythms before they can be fully appreciated. This is especially the case with the "Humoresken," and the sonata for piano and violin in G. The music, moreover, is rather awkward to play—not precisely difficult, in the sense of requiring great executive powers, but uncomfortable until one becomes familiar with it because of the unconventional character of the passages and the constant surprises of the music. The French proverb might be quoted with respect to it "Ce qui arrive, c'est l'inattendu."

The "Humoresken," which stand first on our list, are four small pieces, three of which are in triple time. Here it may be remarked that Grieg exhibits a strong partiality for triple time, and for mazurka and waltz-like rhythms. The first of these pieces is in reality a mazurka, of a charming freshness, and not difficult to play. No. 2 is a vigorous "Tempo di Minuetto," in the somewhat unusual key of G sharp minor. In its general character it reminds one (though with an indefinite yet perceptible difference) of Chopin. The following number "Allegretto con grazia," though only one page in length, is a little gem. The alternations of tenderness and energy, and the strange progressions of the harmonies give this little piece a character altogether unique. Not less interesting is the "Allegro alla burla," in G minor, which concludes the series. The chief theme is founded on one of Grieg's favourite dotted rhythms, and the counter-subject in B flat is one of those wild and dreamy melodies which once heard are not easily forgotten.

The sonata for piano solo in E minor is one of the most interesting works of its composer. The first movement is not equal to those which follow it, being occasionally reminiscent of Beethoven and Weber. This resemblance is chiefly apparent in the first subject and the developments of the second part of the movement; the second subject is thoroughly original. The "Andante molto," in C major, is a most expressive melody,

a genuine "song without words," rising in its middle portion to a storm of passion, which dies away at its close in the wildest and strangest sequence of harmonies (see the *a tempo*, p. 11, last line but one). The third movement, "Alla Minuetto," is indescribable in its quaint charm. Indeed, in writing on such music as this, it is impossible not to feel forcibly the poverty of language. Words will not paint the effect of music, especially when, as in the present case, that music is totally unlike any other. The finale is, in some respects, the most remarkable part of the sonata. The opening arrests the attention at once, and there is a sustained vigour about the movement which carries both player and hearer away. But the most striking point in this finale is the second subject. Here, with a daring perfectly unique, Grieg has boldly violated one of the fundamental rules of harmony by introducing "consecutive octaves" between the extreme parts for four bars. The effect is so new that, at a first hearing, a musician will be absolutely staggered at it; and yet there is a wild beauty about it which is its complete justification. All pianists will thank us for introducing to their notice this very remarkable work.

The two sonatas for piano and violin are of unequal merit. The earlier one in F, though not less original than its composer's other works, has not so much of that spontaneous charm which characterises the pieces already noticed; but the second sonata in G is, in all respects, excellent. It may be considered as a fault that, with the exception of one page of introduction, the entire work is in triple time; but such is the variety of its rhythms that little or no feeling of monotony is produced. It is difficult to say which of the three movements is the most beautiful. Perhaps the palm must be given to the melancholy Andante in E minor. The episodic subject in E flat in the finale is especially lovely. The novelty of the whole work is so great that it is quite possible that it may not be understood at a first hearing; it requires, besides, first-rate playing from both performers, being of considerable difficulty. It has, we believe, been given by Mr. Hallé at some of his recitals in the country with Madame Norman-Néruda; but it has not yet (so far as we know) been heard in public in London.

The concerto in A minor for piano and orchestra, which was played by Mr. Dannreuther at a recent Crystal Palace concert for the first time in England, while one of the most recent, is also one of the most interesting of Grieg's works. In its general form it is modelled after that of Schumann. The solo instrument begins at once—the key-note only being previously given by the orchestra. After five bars of brilliant introduction for the piano, the principal theme of the first allegro is announced by the wind instruments. This theme is remarkable for its originality, both of rhythm and melody; it is repeated by the piano, with some elaboration of the accompaniment, and a series of brilliant passages of display lead us ere long to the second subject in C major—a melody of great tenderness, given to the brass instruments *piano*, likewise repeated in a more ornate form by the pianist. The remainder of the movement is strictly orthodox in form, and full of the most interesting details, some of the modulations (such, for example, as those on pages 18 to 21 of the score) being remarkably bold. Following the example first set by Beethoven in his E flat concerto, the composer has written his own *cadenza*. The whole of this first movement is concise, powerful, and eminently original. The following adagio, in the remote key of D flat, has a very strange wild beauty about it, not a little heightened by the peculiar orchestral colouring. The strings are muted, and all the louder instruments are silent. The first *tutti* has a dreamy character which is simply indescribable, and the way in which the music gradually dies away, one lovely close following another, is one of the most striking things we have met with for a long while. The passages for the

piano which follow consist almost entirely of elegant figures of musical embroidery, supported chiefly by sustained harmonies for the strings. Towards the close of the movement, the chief theme is given to the piano *fortissimo*, but the prevailing tone of tenderness soon returns, and the adagio ends with the series of cadences above referred to, now in a slightly altered form. The finale is as vigorous as the slow movement is tender and delicate. Strongly marked rhythms and abrupt changes are its prevailing features. Very characteristic of Grieg is the introduction of the wild and romantic episode in F (page 66 of the score), so broadly contrasted with the principal theme, and yet not out of keeping with it. The solo part of the work is of great difficulty, hopelessly beyond the reach of any but first-class players. It is, however, most brilliant and effective, while the orchestration of the whole concerto is highly interesting.

It will be seen from our remarks that we have a very high opinion of Grieg as a composer. He is a man of very great originality of idea, and of sufficient acquirements to be able to use his ideas to the best advantage. That he deserves the title of "genius" there can be little doubt; at the same time, it should be distinctly understood that he is not, if one may use the expression, a musical *cosmos* like Beethoven or Mozart. His genius is rather of a nature which moves within a somewhat limited circle. There is a strong family likeness between all the works we have been noticing; and, as said above, their chief characteristic, and it may be added their peculiar charm, consist in their northern colouring. Some musicians will find this peculiar musical flavour more to their taste than others; but it may be safely promised that all who will look into Grieg's music will procure for themselves what in the present day is by no means easy to obtain—a feeling of becoming acquainted with something absolutely new in music.

EBENEZER PROT.

It is announced that Mdme. Florence Lancia will make her last appearance in opera at the Crystal Palace this day, in the character of Marguerite in Gounod's *Faust*.

M. GOUNOD is, we understand, about to return to France, and will not take part, as originally announced, in the Liverpool Musical Festival.

FÉLICIEN DAVID has completed the composition of a grand opera entitled *L'Indien*, which is to be shortly produced at the Opéra Comique, Paris.

FOLLOWING the example set by Verdi in his Requiem for Manzoni, a Neapolitan composer named De Giosa has written a Requiem for Donizetti.

HENRI VIEUXTEMPS, the distinguished violinist, is leaving Brussels to reside at Paris. His successor as professor at the Brussels Conservatoire is to be Henri Wieniawski.

WAGNER's *Rienzi* and Verdi's *Aida* are in preparation as novelties at the National Theatre in Buda-Pesth.

A NEW edition (the fifth) of Franz Brendel's *History of Music* is in preparation; and a continuation down to the present time will be added by Dr. F. Stade.

ON October 31 Herr Julius Rietz will celebrate, in Dresden, the completion of forty years' conductorship.

GLASGOW is at length to have a resident orchestra. The Festival Committee having obtained a guarantee fund of nearly 4,000*l.*, have engaged an orchestra of over fifty performers for a period of sixteen weeks, from the beginning of November. During this period a series of sixteen subscription concerts, one every week, will be given in the City Hall.

POSTSCRIPT.

A TELEGRAM from Paris announces that the remains of Leonardo da Vinci have been found in a perfect state of preservation by some masons engaged in repairing Amboise Castle.

The tomb of the great Italian master, who found his last resting-place in France, has long been an object of search. The fate that destroyed so many of his works seems to have pursued even his grave. In his will Leonardo gave directions that his body should be laid in the church of St. Florentin, at Amboise, and it has always been assumed that his directions were carried out. But soon after his death Amboise was devastated by war, and according to tradition, the church, and even the graves of the dead, were violated; at all events, no tomb of any note remained in the church at the time of its demolition, in 1808, by order of the Senator Roger Ducos. After this, when pilgrims came from Italy to enquire for the grave of Leonardo, they were shown a waste spot covered with debris, where the church of St. Florentin formerly stood. It was on this spot that M. Arsène Houssaye, Leonardo's French biographer, instituted his search in 1863, and was rewarded, as he fondly believed, by the discovery of the skeleton of Leonardo and portions of his tomb. The skull of this skeleton was examined with respect, and "recognised" by M. Houssaye and one or two like enthusiasts as "the grand and simple outline of that human yet divine head which once held a world within its limits." M. Houssaye's deductions, however, were scarcely sound enough to support such a vast theory, and we are not astonished to see them demolished by the discovery now announced—a discovery that, to judge by the wording of the telegram, places the matter beyond doubt. Either Leonardo was not buried in St. Florentin, or his remains, as seems more likely, were removed from that church at the time of its destruction to the Castle of Amboise. The leaden coffin containing the great painter's body, it is further stated in the telegram, will be transferred by the Comte de Paris' order to the castle chapel.

WE regret to see the death announced of Mr. J. H. Foley, R.A., which occurred on Thursday last.

No. 122, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

LITERATURE.

LORÉNZO DE' MEDICI.

Lorenzo de' Medici il Magnifico. Von Alfred von Reumont. Zwei Bände. (Leipzig: Duncker und Humblot, 1874.)

IT is now nearly eighty years since Roscoe's *Life of Lorenzo de' Medici* first aroused in Italy, as well as in England, popular interest in the history of Florence and of the Renaissance literature. The warm enthusiasm and poetic feeling of the Liverpool merchant commanded attention for his subject, and established its importance. But much additional material has been obtained since Roscoe wrote, and Herr von Reumont is amply justified in undertaking the task anew.

Roscoe had a keen literary sympathy with Lorenzo and the polished circle that surrounded him, but he failed in understanding the purely Italian side of his subject. He did not see the general bearings of Italian history during that age; he had only slight knowledge of the constitution of Florence, and the influences under which Florentine politics had been moulded; above all, he had no feeling for the city of Florence itself, for its buildings, its art, its culture, its manner of life.

It is almost needless to say that all these defects are supplied by Herr von Reumont. His previous works have already justly gained for him the reputation of having contributed more than anyone out of Italy to a knowledge of Italian history. In the present work he begins by a clear sketch of the growth of Florence and of its government. He traces the beginning of the connexion between the Medici family and the Florentine democracy. He sets accurately before his readers the political conditions of Florence, both in its internal and external relations. Moreover, he thoroughly appreciates the fact that the greatest record an Italian city possesses is itself; its buildings and its streets, if rightly interpreted, tell all that is most important of its past. With Florence as a city, Herr von Reumont is entirely familiar: and this familiarity is the great charm of his book. He knows its streets and palaces as they were in Lorenzo's days: he knows the men who were then moving in its courts. Though his book consists of 1,200 octavo pages, almost unencumbered by notes, still he is conscious of having laboured at condensation: nor does the detail upon any point exceed the due proportion of the rest. The book is full, without being trivial: there is not a line that is written merely for the sake of effect; everything has a distinct bearing on the knowledge of Italy at the time.

Still, with all these merits on Herr von Reumont's part, we must confess to a doubt whether, if his book had been first in the field, it would have awakened the same in-

terest in its subject as Roscoe succeeded in doing. Both writers are thoroughly engrossed in their work, both are real enthusiasts, both are genuine admirers of their hero. Herr von Reumont sees more clearly his many-sidedness, and appreciates more fully the difficulties he had to contend with. But Roscoe's finer literary feeling makes him more keenly sympathetic with the intellectual greatness of the time. The Liverpool merchant had a personal fellow-feeling with Lorenzo de' Medici which the German student could never have. The connexion of commerce, politics, and literary culture in daily life, was a real problem which he rejoiced in studying for his own good and for that of those around him. So his book has a genuine personal interest. The poems of Angelo Poliziano were to him a source of real enjoyment. The thought of the Medici Gardens, with Lorenzo and his learned circle engaged in friendly discussion was an embodiment of his own highest aspirations. To Herr von Reumont these are objects of study rather than of feeling, of investigation rather than of sympathy.

Hence we may say that of the two requisites for the treatment of the Renaissance—those of an historian and those of a literary critic—Roscoe is better as a critic, though Herr von Reumont is immeasurably superior as an historian. It is in fact as a political and literary history of the times that his book ought to be judged. It is admirable for accuracy and thoroughness, rather than for picturesqueness and interest. The only strong feeling running through the book is the feeling for Florence as a city.

Working purely as an historian, the method which Herr von Reumont adopts is analytic and not synthetic. He takes up points and follows them out. He traces political complications through their bearings on the various Italian states. He mentions no one of whom he does not give a full account. He gives biographies of men of letters and artists, taking each separately, without grouping broad characteristics. He omits nothing of importance for a full understanding of the time; but the reader has to come to his own conclusions by a careful attention to the details as they occur, and is not helped by any broad picture of the leading features. Moreover, he has tried to keep his book within compass by rigidly adhering to the limits of his subject. In the literary and artistic portions of the work these limits are necessarily arbitrary, and as such unsatisfactory. It is impossible to see the true position of Florentine art and literature without some sketch, however brief, of the contemporary progress in the rest of Italy. We cannot really appreciate the patronage of Lorenzo de' Medici without contrasting it with that of the Papacy and the courts of Naples and Milan.

The literary and artistic parts of the book consist of a series of rather disconnected biographies, for which Vespasiano da Bisticci and Vasari are taken as the basis, and even in the arrangement Herr von Reumont has followed his authorities. An example may serve to show how picturesqueness is sacrificed by this method. There is no more striking figure in the history of the early Renaissance than Niccolò Niccoli, the

well-to-do Florentine merchant, who took to literature and art with such enthusiasm that he spent all his money in buying books and entertaining men of letters; who refused to marry that he might not be disturbed in his studies, and lived contentedly on little in a house full of literary and artistic treasures; who ate the plainest food from dishes of the rarest porcelain and drank water out of the daintiest glass. Yet Niccolò loved the Muses with no selfish love, but like another Socrates went forth to teach in the market place.

"Passing one day," says Vespasiano, "Piero de' Pazzi by the palace of the Podestà, and seeing him to be a youth of fair appearance, he called to him, although he had never spoken to him before. As Niccolò was a man of great repute, the youth came at once. When he was come, Niccolò asked whose son he was; he answered he was the son of Messer Andrea de' Pazzi. He asked him what was his employment; he answered, 'Like all young men, I am busied in amusing myself.' Then said Niccolò, 'Being the son of such a father, and being of such fair appearance, it is a disgrace that you do not apply yourself to learn Latin letters, which would be a great ornament to you; if you do not learn them, you will be held in no esteem; and when the flower of your youth is passed, you will find yourself left without any excellence whatever.' Messer Piero, on hearing this, at once approved, and knew that he spoke the truth; and he said that he would willingly give heed to this if he had a teacher who would aid him by his counsels. Then said Niccolò that teacher and books should be left to him, and he would provide everything. Messer Piero thought that there had befallen him a great stroke of fortune. Nor was it long before he, having a good teacher, and being endowed with excellent ability, commenced to have an admirable knowledge of Latin letters, whence he acquired very great honour, and had therefrom great reputation."

Now, since this story is given by Vespasiano in his life of Piero de' Pazzi, it is dutifully referred to by Herr von Reumont in a general historical account of the Pazzi family. It is not alluded to in the account of Niccolò Niccoli, nor is the very striking side of his character which it shows brought into prominence.

In his treatment of his main subject Herr von Reumont is entirely without bias, and is anxious only to arrive at a clear understanding of Lorenzo's time and its difficulties. He is not engaged in drawing social or political morals, but is simply bent on representing the man as he was. He takes Lorenzo as a remarkable representative of a most remarkable age, as the embodiment of all that was characteristic in his time. With a thorough knowledge of Italy at the time, he brings out the intricacies and perplexities of Lorenzo's position in a way that enables us to appreciate very forcibly the strength of character which the age developed.

Lorenzo de' Medici died at the age of forty-three. During this short lifetime he had displayed an astounding versatility of talents, and had exercised an immense activity without any sense of effort or unrest. Everything about him depended on himself. He lived through terrible political crises; he saw his brother murdered before his eyes; he saw himself personally attacked by a coalition of the greatest powers in Italy, and had no means of protecting himself except his own wisdom and the affection of his fellow-citizens. Even after the first storm was over his position was always beset with diffi-

culties. The least disturbance in Italian affairs might be dangerous to him. His business matters were not prospering, and the money of Florence must save him from bankruptcy. At home and abroad his position was precarious, depending on his prestige, on his personal influence, on delicate handling and cleverness of touch. It was not from lightness of heart and the possession of learned leisure that Lorenzo became a poet and a patron of letters. From writing minute instructions to his ambassadors, from poring over his account-books, from answering letters that poured in upon him from almost every part of Europe, Lorenzo passed to the discussion of Platonic theories with Marsilio Ficino, or the criticism of the last new poem of Angelo Poliziano.

It was characteristic both of the man and of the time, not that he did all these things, but that he could do each of them better because he did them all. He took his position as a whole, and worked its several parts together. His political position in Europe depended on the maintenance of his prestige in Florence—his prestige in Florence rested on the fact that he should be in reality, as well as in name, the chief citizen in that brilliant city. As the patron of art, as the central figure of a distinguished literary circle, as the possessor of a magnificent collection of art treasures, Lorenzo held the most prominent position amongst his fellow-citizens.

But this position depended on his personal accomplishments, his tact and kindness. The practical duties of life must not overwhelm the speculative and imaginative power which alone could attract men of genius. He was patron not through his wealth, for many came round him who wanted nothing, and many of those most devoted to him received little or nothing from him; but he drew men of culture to him by his charm of character, his true warm-hearted friendship, his gifted nature, his noble interest in knowledge. In his society there was perfect equality observed; in his presence even literary jealousy was still; personal quarrels and pettiness had no place in his circle.

So, too, is it in his dealings with artists; they write to him on terms of perfect equality: sometimes, it is true, we find him addressed as "Magnifico," but more often simply as "Lorenzo." His arrangements with them were perfectly business-like; he stipulated how much gold and ultramarine was to be used in the pictures which he ordered; he gave directions about the composition of the picture or the character of the background; he fixed beforehand, with the scrupulousness of a Florentine merchant, the exact day on which the picture was to be delivered.

Men of every kind he bound to him, because they knew that he could understand them, because they felt that he genuinely treated them as equals, and because they were sure that he would always be a staunch and true-hearted friend to them. So indeed he was. He was most anxious to extricate Pico della Mirandola from the charge of heresy brought against him at the Papal court: he wrote letter after letter, expressing himself at last in the strongest

terms about the Pope's want of judgment in driving so learned a man to rebel. After the death of Fra Filippo Lippi he was desirous of removing his body from Spoleto to Florence, and when the Spoletans objected, he commissioned Lippi's son to erect a memorial to his father in the Cathedral of Spoleto. It is no wonder that he was beloved when he thus made the interests of those around him his own. And when Duke Federigo of Urbino saw Lorenzo's art treasures, he wondered, not only at their workmanship and worth, but still more at their number, which surpassed all he could have believed. "How great," he exclaimed, "is the power of fidelity and love! I see here a kingly treasure, but such an one as no king can gather together—yea, though he use gold, or might, or war."

So too it was in politics. It was by a skilful identification of the common interest with their own private interest that the Medici rose to power in Florence. Lorenzo de' Medici, though only a Florentine citizen, found himself as much the recognised symbol of the Florentine state as was any king or prince within his own dominions. He underwent the perils of royalty, assassination and the like. His whole position is a strange one, uniting, as it does, the opposite qualities of prince and citizen. Lorenzo directed all the affairs of Florence; kings and princes corresponded with him as with an equal, yet Lorenzo in his daily life was but a Florentine citizen living amongst his equals. "Nelle pompe vostre loderò più presto stare di quà dal moderato che di là" is a characteristic piece of advice which he gives to his son Giovanni when he first goes to Rome as Cardinal.

Lorenzo's daily life was simple, undisturbed by the senseless luxury which tended to prevail at the time. He was magnificent enough in public entertainments, but his own table was simple, and was open to all comers: all the members of his household dined with him except those actually engaged in waiting. In 1488, when Franceschetto Cybo, the son of Pope Innocent VIII., came to Florence to celebrate his marriage with Lorenzo's daughter Maddalena, he was delighted with the grandeur of his reception, and his vanity was pleased by the impression it made on the young Roman barons who had accompanied him. He was lodged in Lorenzo's house; his friends had a palace to themselves. But, after a few days of festivity, Cybo was disgusted to find a very simple table. Mortified, he went to his friends, but found them still living in magnificence. Astonished at this, he ventured to ask Lorenzo the reason. "You," he answered, "I have taken into my house as a son, and as such I treat you. Those who came to your wedding are strangers, and them I treat as becomes my position and theirs."

Whether Lorenzo was content with his position, and what views he had for the future, cannot of course be said. He certainly advanced beyond Cosimo in the direction of personal government: he limited the power of the people, and he practically took the state finances under his own control. But the Florentine citizens were still sturdy upholders of their freedom; what-

ever Lorenzo may have wished, he could not have succeeded in making himself prince. The good and the bad of the Medici rule can only be estimated by comparing Florence with other Italian states at the time. One great result of the development of the commercial democracy of Florence was the feeling of social equality. This feeling it retained, even when it had let go much of its political power. Lorenzo was after all a genuine Florentine citizen, and was always true to Florentine feeling and Florentine traditions; so long as this was the case the Florentines were willing enough that he should exercise over them a princely power. It was otherwise with his son, who from an Orsini mother and an Orsini wife had imbibed some of the insolence and turbulence of the Roman nobility.

These are some of the points which Herr von Reumont brings out in his picture of Lorenzo and of his position. It is of course impossible to follow him into detail; but enough has perhaps been said to show the very high value of his work to all students of Italian history. M. CREIGHTON.

The Valleys of Tyrol: their Traditions and Customs, and how to Visit them. By Miss R. H. Busk, author of "Patranas," &c. (London: Longmans, 1874.)

Tales and Legends of the Tyrol. Collected and arranged by Madame la Comtesse A. von Günther. (London: Chapman & Hall, 1874.)

Miss Busk has written a pleasant description of her wanderings among the valleys of Tyrol, and has turned to good account her acquaintance with the folk-lore of their inhabitants. Her present book is of a less ambitious character than some of her previous works, and is therefore all the more likely to be appreciated by the general reader. To a small circle of story-comparers collections of folk-tales offer an unceasing attraction, but by a large section of the reading public they are considered superfluous. If deftly inserted, however, into a volume of travels, a moderate number of local legends may be not only endured, but even welcomed by subscribers to circulating libraries. And thus the stories with which Miss Busk has gracefully sprinkled the record of her rambles will doubtless find favour in many more eyes than if they had been huddled together in a volume bristling with puzzling quotations, hampered by impeding foot-notes, and to the uninformed majority rendered repugnant by an air of superior knowledge.

These stories are mostly of a serious nature, and fruitful in improving doctrine. Even the demons and phantoms which haunt them serve to point an unimpeachable moral, instead of simply rendering ghastly an unedifying tale. In one legend, for instance, we are told how a grasping farmer was doomed after death incessantly to tread a strip of soil which he had stolen from a neighbour, and to drag after him a red-hot ploughshare; until at length a scrupulously honest successor replaced the fraudulently shifted landmark in its original position, and the wearied ghost was freed from its long penance. In another, a poverty-stricken

peasant enters into an unholy compact with a demon "in the old Frankish costume," receiving wealth, and in return agreeing to bear "the cold torment" after death in place of his enricher. So he long leads a merry life, taking the precaution, however, to provide himself with "a whole suit of the thickest rough woollen cloth" to die in. And in the night following his death he is seen to "get up from the bed in all this warm clothing, and shut the gate behind him, and go out into the forest to deliver the spirit which had enriched him." So religious indeed, we are told, is "your whole *entourage* while in Tirol," that even "the very masses of frozen water, arrested by the frost as they rush down the railway cuttings and embankments" are seen in the half-light to assume "such forms as Doré might give to prostrate spectres doing penance." In most countries swallows pass for well-behaved and meritorious birds. Even in Italian Tyrol they are called, we find, *Ucelli della Madonna*, but in North Tyrol Miss Busk hears a legend to their discredit. During the Crucifixion, it runs, "all the beasts of the field went and hid themselves for shame, only the frivolous swallows flitted about under the very shadow of the holy rood, and twittered their love-songs as on any ordinary day." And therefore they never perch on "anything green and fresh," but are always hovering "over nasty dirty marshy places." Surely this story must originally have been told of bats. Much more in keeping with the graceful bird's usual reputation is the Russian legend that while our Lord was hanging on the Cross the sparrows kept crying out *jif, jif!*—he is living!—in order to stimulate the executioners, while the swallows with opposite intent twittered *umer, umer!*—he is dead. Wherefore a swallow is a welcome guest in Russia, as well as in some South Slavonian lands, in which it is said that dead children are supposed to return to their old homes at springtide in the shape of swallows and martins. No better illustration of the religious tone given to old heathenish stories can be found than is afforded by the following improved version of the Rip van Winkle myth. A youth, whose sweet-heart was taken from him by death, fell asleep in a cave, and dreamt a dream in which he fancied himself married to his lost love, and living happily with her for many years. When he woke and returned home he found all was strange, and discovered that he had dreamt away a lifetime in the cave. At length in the churchyard, as he bent above his Filomena's grave, a fair form, borne on a moonbeam, appeared to him. "'Who are you, and wherefore sought you me?' he asked. 'I am Death,' replied the fair maiden, 'and for fifty years I have sought thee to lead thee to Filomena.' She beckoned as she spoke, and willingly he followed her whither the moonbeam led." It is instructive to compare this very modern rendering of an ancient tale with the archaic form it assumes in the Norse variant given by Asbjørnsen, and translated by Dr. Dasent under the title of "Friends in Life and Death" (*Tales from the Fjeld*, p. 160).

The chapter on Italian Tyrol contains some curious and interesting information

about the Orco who answers to our Ogre, and "certain beings called 'Salvans' and 'Gannes.'" The Salvan is evidently a sylvan being enwrapped in little mystery, but his companion Gannes appears to offer difficulties. "May not *Gannes* have some relation with *kan* or *khan*?" asks Miss Busk, referring to p. 322 of Mr. Isaac Taylor's *Etruscan Researches*. But this solution does not appear to be more satisfactory than the ingenious coupling of the southern Orco with the northern "Nök, Neck, Nikr"—the best commentary on which is Miss Busk's own foot-note, to the effect that "mere similarity of sound may lead one absurdly astray; as if anyone were to say that the old fable of rubbing a ring to produce the 'Slave of the Ring' was the origin of the modern substitute of *ringing* to summon a servant!" Mere guesses at linguistic truth are not likely to lead to very beneficial results.

Nor is it only the dabbler in philological studies whom a seeming similarity may lead absurdly astray. That a hasty observer of popular customs may be seduced into a mistaken conclusion is a fact sufficiently well known, but a useful warning to such observers is conveyed by another of Miss Busk's foot-notes. "On enquiring into some very grotesque ceremonies performed in Trent, at the close of the carnival, and called its 'burial,' I learnt that it did not appear to be a Tirolean custom, but had been introduced by the soldiers of the garrison, who, for a long time past, had been taken from the Slave provinces of the Austrian empire, and thus a Slave popular custom has been grafted on to Tirol."

Countess von Günther's *Tales and Legends of the Tyrol* puts forward no claim to be considered scientific, but it is a pleasant story-book, and it contains a good deal of genuine folk-lore. Orco appears in it several times, generally as a black dog of hideous appearance; the ghost of a heart-broken widow wanders about a haunted castle, and "in the year 1720 it happened that a descendant of one who had been instrumental in her husband's death, who was sleeping in the castle, was found dead in his bed on the following morning, with a most fearfully contorted neck." In the "pilgrim's chapel of the holy Romedius, near Thaur," a board is still to be seen, we learn, bearing the mark of a fiery hand, burnt into it two centuries ago by the grasp of a soul in purgatory; and at Brixen stands a lordly mansion, through the old picture-gallery of which wanders by night the ghost of one of its former lords. During the French invasion, in 1797, it appears, a heedless stranger who slept in the haunted gallery was hugged by the ghost to death. In the valley of Alpbach "a gold-worm of wonderful brilliancy" is often to be seen, lying motionless "and wrinkled in such a manner that it looks like a golden chain;" in one of the lakes actual chains of gold are sometimes visible, stretching from the depths to the shore. Within the memory of man, or at least of "the men of Inzing and Zirl," a dragon, described as "an enormous thick long worm," was washed by an inundation out of a cavern in which it had resided for centuries. Those who saw it state that it was "a gigantic snake with the head of a

dragon, two large ears, and hideous fierce fiery eyes." To this day "not an atom of green will grow on the meadow where he died."

W. R. S. RALSTON.

The Poems of William Blake: comprising Songs of Innocence and of Experience, together with Poetical Sketches, and some Copyright Poems not in any other Edition. (London: Pickering, 1874.)

THIS pleasant-looking little volume is essentially a combination of two collections of Blake's poems previously issued by Mr. Pickering's house. The *Songs of Innocence and Experience* were first republished by that house in 1839, and again, with some other poems added, in 1866; and the *Poetical Sketches* in 1868. The editor is now, as in the last two instances, Mr. R. H. Shepherd. This is the least incomplete collection as yet in the market, but is nevertheless far from being actually complete: a considerable number of poems from a MS. source that were first published in Mr. Gilchrist's *Life of Blake* are not included here. Mr. Shepherd speaks, in his title-page, of "some copyright poems not in any other edition;" and, in his preface, of "a number of inedited autograph poems of Blake," and of "a few other short pieces written in the fly-leaves;" and he adds, "Not a few of these pieces do not appear in Gilchrist's *Life of Blake*, and, being the publisher's copyright, cannot appear in Messrs. Bell's forthcoming edition." These are misleading expressions. Of "copyright poems not in any other edition," there are here but two—viz., the brief and rather trifling "Song by a Shepherd," and "Song by an Old Shepherd," both of which are quite new to us: these must, we suppose, be the "few other short pieces written in the fly-leaves," and are not only few, but simply two. The "number of inedited autograph poems" dwindle down to one,—the one entitled "Long John Brown and Little Mary Bell;" for all the remainder to which this term is applied by Mr. Shepherd had, before Mr. Pickering ever published them, been printed in Gilchrist's vol. ii. The same remark disposes of the assertion, "Not a few of these pieces do not appear in Gilchrist's *Life of Blake*." Those which do not so appear are merely the "Long John Brown" aforesaid, and probably two or three out of the five lyrics now republished by Mr. Pickering from Blake's *Jerusalem*, his *Milton*, and his edition of Blair's *Grave*; but these five are of course not accurately referred to as "the publisher's [Pickering's] copyright." As to "Messrs. Bell's forthcoming edition," that will have to speak for itself when it makes its appearance. Precise accuracy of announcement, whether applied to a re-edition of Blake, of Shelley, or of whomsoever else, would in the long run count as an editorial virtue. Apart from these small points, we have only to congratulate the admirers of Blake on the opportunity which, through the medium of the present volume, they now have of extending their acquaintance with these mostly delightful and often exquisitely perfect poems.

W. M. ROSSETTI.

THE FIJI ISLANDS.

Ten Months in the Fiji Islands. By Mrs. Smythe. (London and Oxford: John & James Parker.)

PUBLIC attention has been so recently directed to the Fiji Islands by the late debate in Parliament respecting their proposed annexation to the British Empire, that any trustworthy information from an eye-witness as to their capabilities and resources will be welcomed with pleasure, and we therefore make no apology to our readers for introducing this book to their favourable notice, even though the date on its title-page is that of 1864. It consists of a series of letters, written by Mrs. Smythe during a visit which she made to the islands in 1860, in company with her husband, Colonel Smythe, of the Royal Artillery. This officer was sent out by the British Government to ascertain the wishes of the Fijians on the annexation question, and to judge whether the islands themselves were sufficiently valuable to justify their acceptance by Great Britain. The question of annexation was started in 1858, when the first British Consul of Fiji, Mr. Pritchard, arrived in England bringing with him samples of native grown cotton, and a document purporting to be an offer from the so-called King of Fiji, or Viti, Thakambau, to cede his sovereign rights to Queen Victoria, on conditions which we shall afterwards explain.

The importance of creating a new source for the supply of cotton, so as to render us, if necessary, independent of America, was, of course, so great, that the subject immediately attracted the serious attention of Her Majesty's ministers and the Manchester Cotton Supply Association. In the year 1859, the Duke of Newcastle, then Secretary of State for the Colonies, appointed Colonel Smythe as special commissioner to Fiji to investigate the question. Colonel Smythe was accompanied by Dr. Seemann, an accomplished German botanist from Kew, who was recommended by Sir William Hooker to make a botanical investigation of the group. Dr. Seemann took out with him cotton seed of two kinds, the Sea Island and New Orleans. The first never germinated, but the second was successful—seed sown on June 9 producing by the middle of October plants of from four to seven feet high, with very fine ripe cotton pods. From a recent authority we find that the amount of cotton produced in Fiji in 1873 amounted to 14,000 cwt., thus giving promise of a lucrative trade in this important staple, if properly developed and fostered by a more direct communication between the islands and Great Britain than now exists. The great obstacle to the cultivation of cotton in Fiji arises from the difficulty European planters find in procuring sufficient labour to work the estates. The natives have but few wants, and care little to labour for wages they do not actually need. Hence arose the importation of labourers from the New Hebrides and other islands of the Pacific.

Mrs. Smythe in page 153 gives an amusing account of the difficulties they met with in laying out the garden terraces of their house at Levuka. The first band of impromptu workers arrived with no tools whatever

save a couple of long knives, and on seeing Colonel Smythe they all sat down on the ground as a mark of respect. On receiving instructions for their work, they dispersed into the wood to cut staves for digging and cocoa-nut leaves, from which they soon plaited baskets to remove the earth they dug out, rejecting any attempt to provide them with more suitable tools. When Mr. Binner, the resident missionary at Levuka, was building his house, he furnished his native workmen with a wheelbarrow for carrying away the earth. For the first day they used it properly, pleased with the novelty of the thing, the second day they carried it like a box, and the third day they took off the wheel and went about with it by turns on their heads!

On his arrival Colonel Smythe found that Thakambau, the so-called King of Viti, was acknowledged by only a small minority of the chiefs, so that he had no right to cede the islands to another power. Still, even those chiefs who disputed his claim to sovereignty were anxious to place themselves under the protection of British rule, as they were then suffering from a flagrant act of oppression on the part of the United States. In 1849 the house of the American consul had been accidentally burnt, and some of his goods stolen by the natives; while other losses were suffered by American settlers, during the burning of Levuka by a native force. For these losses Commodore Boutwell was sent to demand compensation, and in 1855 he claimed 38,500 dols., making Thakambau responsible for the collection of the fine throughout the islands. Distressed at the exorbitant demand, the Wesleyan missionaries remonstrated with him on behalf of the natives, but the result was that he immediately raised the sum to 45,000 dols. with interest at eight per cent. till paid, to "punish them for their interference." From this moment Fiji (or Viti) was saddled with a heavy debt, which the chiefs in vain strove to discharge. A few of them then elected Thakambau King of Viti, and with him signed the document brought to England by Mr. Pritchard, offering the cession of the Fiji Islands to Great Britain, if she would discharge the debt claimed by the United States. The home Government, however, taught by bitter experience in New Zealand, were by no means inclined to close with the offer hastily, and awaited the result of Colonel Smythe's mission before pronouncing any opinion on the subject. Colonel Smythe, accompanied by Mr. Waterhouse, chief missionary in Fiji, as interpreter, and also by Dr. Seemann and Mr. Pritchard, started on a tour round the islands, convening large open-air assemblies of the chiefs and their people in every place of importance, in order to elicit their real feeling respecting the proposed annexation. With scarcely an exception, he found the proposal favourably received, but nevertheless he himself reported decidedly against it to the home Government: 1. Because, in his opinion, the Fiji Islands were not suited as a mail station for steamers running between Panama and Sydney, as had been represented. 2. He doubted the success of the scheme to grow cotton to any large extent in the islands. 3. He considered the possession of Australia and New Zealand already gave England

sufficient power in the Pacific, rendering her independent of any fresh acquisition there, that might only prove a source of embarrassment in the event of war. He sums up his report in these words:—

"On a review of the foregoing considerations, and the conclusions derived from a personal examination of the islands and the people, I am of opinion that it would not be expedient that Her Majesty's Government should accept the offer which has been made to cede to Her Majesty the sovereignty over the Fiji Islands."

Nothing could be more decided than this opinion, and it is therefore gratifying to learn from one of the speakers in the late debate in the House (Mr. MacArthur) that Colonel, now Major-General, Smythe argued on grounds which have since proved untenable, and that he has recently confessed his error, and acknowledged himself favourable to the measure he had before opposed.

Disappointed by the rejection of his offer, and by the failure of his endeavour to discharge his American debt through the English Government, Thakambau lent a willing ear to the advances of a "Polynesian Company" from Melbourne, who in 1868 promised, on certain conditions, to discharge his debt to the United States, and also to allow him an income of 200*l.* a year. They paid the debt as they agreed, and attracted, by false hopes and promises, a number of emigrants to the islands, but in course of time the company collapsed, and Thakambau was left to his own resources. Many and various have been the schemes proposed and tried since this time for the government of the islands: in 1869 the protectorate was offered to the President of the United States, and declined; and as matters went on getting gradually worse and worse, in spite of the efforts of amateur legislators on the spot, there seemed no chance of peace or order. The white settlers refused to submit to the so-called Vitian Government; and so great was the anarchy that prevailed, that during the last two years scarcely had a day passed without the presence of a British cruiser in the bay of Levuka, to overawe the disputants, and prevent the bloodshed that would have otherwise ensued. As an instance of the mismanagement of the Vitian Government, we may mention that in 1873 the debts contracted by them during the two previous years amounted to 75,000*l.* The ministers who were empowered to spend 89,000*l.* had spent instead 120,000*l.*, and we find it stated in the House of Commons that Fiji is now saddled with a debt of some 87,000*l.*

At length, in January, 1873, the Fijians, through Mr. Thurston, their Secretary of State, again renewed their offer to cede the islands to Great Britain; and again a commission of enquiry was entrusted to Captain James Goodenough, and Mr. Layard, the present Consul in Viti, by Lord Kimberley, under the late Government. The report of these two gentlemen is so favourable to the scheme of annexation that, after grave deliberation, Lord Carnarvon, the present Secretary of State for the Colonies, has directed Sir Hercules Robinson, an officer of known discretion, to proceed to Fiji with a view to the accomplishment of that object. His lordship concluded his speech on the

subject in the House of Lords with these words:—"I believe that the difficulties when boldly faced will not be found to be very considerable, provided the cession comes to us untrammelled by unworkable conditions; and although I am aware of the magnitude of the task, I shall not be afraid to encounter it."

Of the advantage it will be to England to acquire such an advanced position in the Pacific as the Fiji group, we think there can be now no reasonable doubt. Between Australia on the one hand, and Vancouver's Island and Columbia on the other, a distance of fully 7,000 miles, we have not at present an islet on which we could form a coaling station. France is about to establish a line of steamers between New Caledonia and Tahiti, making Fiji its central dépôt; while another line now runs between Australia and San Francisco, calling also at Fiji *en route*, and thus bringing the islands within forty days of England. Our interests in the Pacific seem to require the acquisition of such a port as Fiji to ensure the development of the trade that is likely to arise there under peaceful British rule and by the outlay of British capital. The cotton plant has now found a congenial home there; the sugar-cane is indigenous to the soil, and only needs capital and labour to make it a fruitful source of wealth to the settler. Nevertheless, the difficulties before Her Majesty's Ministers in the colonisation and peaceable government of the islands will be neither few nor light. The question of land tenure will be difficult of solution, as there is scarcely an acre of ground in Fiji which is not private property, the ownership vested either in families or individuals. Also there still exist a formidable number of fierce cannibal natives, variously estimated, according to the bias of the person computing, at from 7,000 to 20,000, who are likely to prove most troublesome neighbours to European settlers. Thirty-three years ago the natives of this group were cannibals, whose cruelty was scarcely to be matched in any other part of the world. Up to the year 1854, many of the chiefs had their own human breeding establishments, and the ovens at Bau for cooking human flesh were scarcely ever allowed to grow cold. These cannibals gloried in the number of their human victims, one man boasting that he had himself devoured 172. Undaunted by the terrible character of the Fijians, in 1835 two devoted Wesleyan missionaries went over from the Friendly or Tonga Islands with their lives in their hands, determined to christianise them if possible. They were soon followed by other labourers of the Wesleyan body; and so marvellous is the success that attended their work, that the following statistics were laid before the House in the recent debate by Mr. Baillie Cochrane:—In Fiji, in April, 1867, there existed—chapels, 481; other places of worship, 238; missionaries, 12; native teachers, 38; catechists, 591; day school teachers, 1,351; local preachers, 474; church members, 17,829; attendants on public worship, 90,442; day schools, 1,215; Sunday schools, 750. To say that the Wesleyans have not always acted with discretion in Fiji would be but to confess that they

are human; still, such results after thirty-three years' labour are most astonishing.

So much for the proposed annexation of Fiji, the consideration of which has led us to digress from the immediate subject of this notice. Our readers will find *Ten Months in Fiji* well worth their perusal. It is pleasantly and simply written, and the descriptions it gives of the climate and scenery of the islands are so bright and beautiful, that we cannot but congratulate ourselves on the hope that this group will soon become an integral part of the British dominions.

A. M. E. SMITH.

Li Bourgadeiro. Par A. Bigot. (Nismes, 1874.)

M. BIGOT, unlike most of the modern poets of Southern France, has published his volume of *patois* poems, *Li Bourgadeiro*, unaccompanied by a French translation. "I do not pretend to write a language," he says in his short preface, "but a dialect—the dialect of my native city, the idiom used by our work-people, with its rough strength and harmony. I have tried to note down a sound that is dying away, the sound that echoed round my cradle and wakened my first smile." So fully alive is M. Bigot to the actual state of the language and its future prospects, that he adds, "It will really be by those who speak French that I shall be understood; they who only speak and understand *patois* being able neither to read nor write." The dialect still spoken in a great centre like Nismes has naturally been more modified by French influences than the speech used in the outlying hamlets and villages. Bearing less affinity to the original tongue of which it is a corruption, and gradually losing its distinctive character, it stands in less need of interpretation than the dialects which have been, as it were, partially fused anew and restored by the Provençal revivalists. Therefore, while Mistral, Aubanel, Arnavielle, Mathieu and others publish their works accompanied by a translation at once so careful and studied, that in some instances the poet has been suspected of moulding his original verse rather with a view to its second and more widely understood rendering, M. Bigot has thought it unnecessary to add note or glossary to the four editions of a work that does not purport to be the expression of a literary or philological revival.

Li Bourgadeiro is a collection of short poems, the subjects of which harmonise perfectly with the graphic but rather shrunken language in which they are written. M. Bigot seems to be of the same opinion as the critic of *Les Nouveaux Samedi*s, who says that Provençal, or what remains of it in the divers dialects, has been used so exclusively by the purely labouring classes that it has become, as it were, debased and materialised in such homely service; and therefore homespun becomes it better than silk or satin. The title chosen by M. Bigot for his book is the name given to the inhabitants of the suburbs of Nismes,—or rather to that district which lies between the heart of a city and its suburbs,—and which is, in this instance, occupied by silk weavers and artisans. *Li Bourgadeiro* contains no

thought that is either too fanciful or too perplexed for the class it represents, no experience that is not perfectly in tune with the workaday world. M. Bigot's portraits are drawn *con amore*, and in a thoroughly genial manner. We seem to have learned of that kindly simple being, "our old school-master;" we quite understand that "my granny's psalter" should stand among the cherished books of the household, and we can almost join in the lamentations of the "whole neighbourhood" when "Master Jan" dies. In "Marioun" we see how courting days appear when we look back at them through the dim eyes of old age, and in "the bonnet of my uncle Jack" we have the description of one of those characteristic garments which seem to become almost a part of the wearer, responsive to every emotion, like the ears of a sagacious dog. Among the most popular of *Li Bourgadeiro* are the imitations from La Fontaine's Fables—imitations, for M. Bigot does not think of calling them translations. The masterpieces of the great French fabulist are treated in a manner differing much from that which charmed the critical wits and *beaux-esprits* of Louis XIV.'s court. Addressing a very different audience, M. Bigot has been able to reproduce the pithiness and point of the original fable, remarkable at once for its elegance and simplicity, while giving the subject a broader treatment, racy with local speech and customs. His Bible narratives are also excellent—the "Prodigal Son," for example. Here we have an old grandmother sitting at the close of the sultry Southern day beside the open door, telling the little child, who sits with its soft fingers clasped in her trembling hand, "one of those good stories that never tire." Then follows the good story, strangely divested of its Eastern dress. However, if the old grandmother describes the turbulent youngster claiming his inheritance somewhat jauntily, his cap stuck on one side of his head—as she had probably seen many a graceless *noir-do-weel* in her long day—yet she has understood the pith of the matter, the youthful unrest, the hungry absence, the broken-hearted return; these are of all time and of all countries, and M. Bigot tells a Bible narrative in such fashion that we do not wish, as is mostly the case when such subjects are treated, that the grand old story had been left alone.

The author of *Li Bourgadeiro*, as we have already said, sets forth that he attempts nothing beyond writing down a dialect endeared to him by early and popular use—a dialect that is dying out; and his poems, be they imitations, sketches, or love songs, are perfectly consistent with this statement. Unlike M. Mistral, who shows us in *Mireio* and *Calendau* how laboriously and enthusiastically he could revive a once beautiful language, how passionately he could deprecate the thought of its extinction, M. Bigot has made no attempt to ennoble debased idioms, to reintroduce obsolete words: he has just used the speech of his native city with its corruptions as it is actually spoken by illiterate persons, and with a frank recognition of its transitory nature. Whether we feel inclined to sympathize with M. Mistral's enthusiastic hopes, which find a certain

raison d'être in his undoubted genius, or whether we accept M. Bigot's more common-sense view of the matter, we cannot help feeling a keen interest in a literature that has produced so much that is fresh and lovely: leaving it to time to determine whether its sweetness be the same as that which lingers in the song of the dying swan, or whether its joyousness be that of a new birth.

E. MARZIALS.

History of Louis XI.: his Period, his Achievements as Dauphin, his Ten Years' Administration in Dauphiny, his Five Years' Residence in Brabant, and his Reign. By Urban Legeay, Honorary Professor to the Faculty of Letters at Grenoble. (Paris: Firmin Didot, 1874.)

THE long title of this work indicates the bounds which the author has assigned to his subject. He has resolved to write, not merely an account of the reign of Louis XI., but also the whole of the history of that monarch before he ascended the throne, and that of the century to which he belonged; nor have we any reason to complain of the extensive nature of the design. Such a man as Louis XI. cannot be understood unless we view him from the commencement of his career: as King he inherited historical antecedents from the period when he was Dauphin; and in general it is almost impossible to describe intelligibly the conduct of a king who has exerted a powerful influence on the world, without mentioning the circumstances amidst which it occurred, the obstacles which lay in the way, its various deviations, and the causes of its final triumph. I shall therefore make no complaint of matters found in this history which may appear extraneous to the immediate subject: I shall rather find fault with the superfluity of certain details which really concern it. The account of the coronation and of the banquet which followed it might have interested those who are curious about such details of the time, and the historians of the house of Burgundy delight in drawing such pictures at large; the modern reader will here gladly turn over the leaf, and treat in a similar way all the pages which the author has devoted to such subjects. The lively interest which M. Legeay takes in everything concerning Louis XI. has failed to render the author sufficiently distrustful of himself. This interest amounts to an actual passion, and the present work is a striking instance of the advantage and disadvantage of such a sentiment in writing history. The advantage is that the author has shrunk from no amount of research, but has resolved to see and collect as much as possible, in consequence of which he has presented us with the most complete information hitherto furnished respecting that epoch. The disadvantage is that he has too much aggrandised his hero, and not merely aggrandised, but transfigured him. The work is a systematic defence of Louis XI. History at the present day already dissented widely from the judgment formerly passed upon him. It had done justice to many acts of his reign: above all, it had established the importance of the results achieved by

him in strengthening the royal power and extending its dominion. But this is not enough for M. Legeay; he wishes to redeem the character of his hero: "no prince of his time surpassed him in loyalty." It is true I would not undertake to defend him in other respects, but in any case the virtue mentioned might be passed over in silence when we are discussing a prince. Even Comines, that devoted servant of Louis XI. — Comines, whose zeal and devotion for his master is praised by the author himself — does not escape the reproach of having failed to treat him so well as he ought to have done. We know how ingeniously Comines, who in the course of his narrative suppressed any mention of those cruel acts with which Louis XI. has been most justly reproached, takes them up at the close (book vi., chap. xviii.) in connexion with the sufferings and torments of his last days, as if to find in them some expiation for his faults, and so procure his pardon from God and man, "inasmuch as I hope they will conduct him to Paradise, and that they have formed part of his purgatory." The modern historian cannot forgive his predecessor for entertaining such a thought. He will have no purgatory for Louis XI., either in this life or the next. "The point is," says our author, "to determine whether he was, or wished to be, just. Mercy is not always possible to the chief of a great people, whose duty it is to repress so many misdeeds;" and he is of opinion that the acts with which Louis XI. has been so much reproached were but justice after all. The author will find some difficulty in convincing the public upon this head, but he will afford it instruction on many other points, and on this account (with the above reservations) his book deserves to be commended. Unfortunately he died before he could himself superintend the printing of the work. He was therefore unable to give it those last touches which are so efficacious at the time when the manuscript returns to its author in a printed form. He was unable to complete the references to the authors whom he quotes, which is the more to be regretted since the judgments he passes require so much modification. A few months were wanting to his completing a work which had cost him the labour of ten years, and which closed a career of instruction of forty years' duration.

H. WALLON.

Pedigrees of the County Families of Yorkshire. Compiled by Joseph Foster. Vols. I. and II. West Riding. Vol. III. North and East Ridings. (Printed and published for the compiler by W. Wilfred Head, 1874.)

THE goodly array of authorities and helpers which Mr. Foster recites in his short preface should be a sufficient guarantee of the accuracy and care with which this work has been prepared; and we see nothing whatever to object against the claim set up for it, that it will be a work of reference for all time. The topographical and genealogical history of Yorkshire, except in those parts which have been illuminated by the pens of Hunter and Whitaker, has been too much neglected for

us not to give an undertaking like this every welcome, and to hope that Mr. Foster will meet with an ample return for his labours.

A work of this nature affords little scope for detailed criticism, but it suggests a few remarks about the decay and extinction of old families which may suitably find place here. In running the eye over the list of pedigrees preserved for us in these handsome volumes, we meet with many ancient and honourable Yorkshire names, which would have filled an equally prominent position in any like compilation undertaken two or three centuries ago. The name, it is true, exists, but the family in nearly every case, strictly speaking, is gone. As an illustration of this, let us take that part of the West Riding known as the Deanery of Doncaster. When the heralds visited Yorkshire in 1584 they compiled a list of such as by common consent were accounted gentry in each wapentake of this Deanery. Rather more than a hundred persons appear in the list; but few male descendants still remain. The Wentworths became extinct by the death of Peregrine Wentworth in 1809, though many representatives of different branches by female descent have assumed the name. The Wombwells still retain their ancient seat, though not without its having passed from their hands for a while, and having been repurchased by a junior branch which had become enriched by its connexion with East Indian affairs. A few estates, such as Wortley and Bretton, could be named as being still held by descendants of the possessors named in the list, but the male line has been lost. Over families in other divisions of the Riding "Time's effacing fingers" have, perhaps, passed more lightly.

Among old families of whom not a trace is to be found in Mr. Foster's volumes are some whose vicissitudes would furnish as entertaining a chapter as is to be found in Burke. Foremost of these we should place the Reresbys of Thribergh. This family attained its highest position in the person of Sir John, whose Memoirs, illustrating the times and court of Charles II. and James II., have passed through many editions, and still form one of the best histories of that period. His son, Sir William, was left a large estate and much ready money, which was dissipated in a very short space of time: he died in extreme want, a tapster in the Fleet prison.

The Gargraves of Nostell are a similar instance of a family being utterly ruined in the course of a single generation. Sir Thomas Gargrave was a trusty counsellor of Queen Elizabeth, and filled a prominent position in the county as vice-president of the North. One of his grandsons was tried and executed at York for the murder of his servant; and of another, Sir Richard, who succeeded to the estates and dissipated them, it is said that he "could once ride on his own land from Wakefield to Doncaster, and had horses innumerable at his command, but was at last reduced to travel with the pack-horses to London, and was found dead in an hostelry, with his head on a pack-saddle." One of Richard's sisters, Mary, was maid of honour to Anne of Denmark, Queen of James I. On the Queen's death she received 1,000*l.* and 200*l.* a year, a very handsome

provision for those days, but evidently not sufficient for her wants, for in 1639 she petitioned Charles I. for protection against her creditors "to prevent an old servant of the king's late mother from dying miserably in prison." The last known descendant of this family filled the humble office of a parish clerk.

One of the best attested pedigrees, according to the eminent authority Joseph Hunter, in the whole range of our genealogical literature, is that of the Rockleys of Rockley. The chiefs of the line never forsook the valley in which the first ancestor settled himself soon after the Conquest, till they were driven thence by the effect of the civil wars, and some great misfortunes arising out of lawsuits which befel Francis, the last male in the eldest line. Robert Rockley, who inherited little but the blood, the name, and the arms, was a confidential steward of the Kaye family; he is said to have been fond of genealogical research, and his gravestone in Almondbury Church records "that he bore his great disappointments and hardships with patience, and made no merit to himself of his expectations or extraction, though he was the last stem of the ancient and once opulent family of Rockley of Rockley, in Worsborough."

J. J. CARTWRIGHT.

Technical Training. By Thomas Twining (one of the Vice-Presidents of the Society of Arts). Being a Suggestive Sketch of a National System of Industrial Instruction, founded on a general Diffusion of Practical Science among the People. (London: Macmillan and Co., 1874.)

POPULAR education in all its branches has of late taken such a prominent place in public discussion, that the weary reader may almost be pardoned for doubting whether it is worth his while to take up a new book upon the subject. Mr. Twining, however, has done well to publish his views on the matter, not only because he advocates a department of instruction which has hitherto been unduly neglected in this country, but especially because his own large practical experience and warm sympathies qualify him to treat it in an original and comprehensive manner. Long residence in different parts of the continent had taught him the national importance of a technical training for the working classes, while his own warm heart and practical disposition have led him to organise and carry out by his individual efforts a private system of scientific teaching in the poorer districts of London, which, on the one hand, is connected with the ordinary wants of every household, and on the other, leads up to industrial instruction. He had also formed an elaborate collection of all substances and articles which illustrate the economics of daily life, to which the national museums at South Kensington and Bethnal Green are heavily indebted in many ways, but his own collection was unfortunately destroyed by fire in the year 1871. His book, therefore, does not represent a mere speculative theory, as might perhaps be assumed from the title page, but is in reality an elaborate extension of his own experience to

the entire working population of England. That science should be taught in all schools, and that artisans should be instructed in the general scientific theory of their own particular trades, would now be generally admitted by such as have considered what our educational system in the future must become, if England is to maintain her manufacturing position among the nations. It ought to be universally known that Switzerland, Germany, France, and Belgium are more than threatening to outstrip this country in many branches of manufacture, solely because of the superior education they offer to their working men. On this fundamental necessity Mr. Twining does not dwell, but contents himself with referring to the abundant authorities which prove it: his peculiar merit is to have indicated the manner in which this want may be supplied with the greatest economy and the most advantage. The essential feature of his scheme is its utilitarian character. He would bring science down from her throne on high and seat her in the home of every poor man. It is not Abstract Science, as a body of reasoned truth, that he is desirous to have taught, so much as Applied Science, condescending to instruct and guide the artisan in all the needs of his daily life, and to assist him in his trade. No familiar example and no alluring device is to be neglected which may render science more intelligible and more attractive to common minds; and the continual aim of the teacher should be to inculcate that Science is in reality the highest and most useful form of Common Sense. The worldly interests of the pupils are to be appealed to and their curiosity excited, by borrowing the objects of illustration from common life, and by impressing their eyes equally with their ears. That a very considerable amount of sound scientific knowledge can be acquired through this method by average working men Mr. Twining has proved by experiment; for a course of nine lectures, drawn up on this principle, and entitled "Science made Easy," has been delivered in different parts of London during the past eight years to audiences collected almost from the street; and the success of the experiment is shown not only by the numbers and feelings of the hearers, but also by the satisfactory manner in which they have gone through examinations in the matter of the lectures. If then physical science is to be taught in all the primary schools of the land, as has been distinctly recommended in the Second Report of the Royal Commission upon "Scientific Instruction and the Advancement of Science," no mode of carrying into execution such a grand scheme appears so practicable as the method which Mr. Twining here suggests, for, apart from its proved possibility, it contains these three separate advantages: it will augment the health and comfort of every home to which it penetrates, it will guarantee the pleasant acquisition of a general foundation of scientific knowledge, and upon it can be based the particular technical instruction which each several man may want.

To have done only so much as this would fairly entitle Mr. Twining to a high meed of praise, but the purpose of his book by no

means stops here. Its avowed object is to present an elaborate scheme of Universal Technical Instruction, and to advocate the creation of numberless Industrial Institutions, all in subordination to one great Central Technical University. His scheme is not only comprehensive, but also complete; it descends into the most minute details, and anticipates every requirement of organisation, so that if only the money were forthcoming, and the co-operation of others ensured, it might be realised at once in all its fulness. In the Introduction Mr. Twining candidly states his qualifications for such a gigantic task, and also the occasion which led him to grapple with it in such a systematic way, but his execution of the work irresistibly suggests that the time is not yet ripe for such a vast undertaking, and that he would have been wiser if he had devoted himself rather to the development of his general principles and had been less dogmatic in his details. There is something almost French, and certainly Utopian, in the elaborate exactness with which he divides and subdivides his whole subject. Every possible contingency is to be provided for beforehand; nothing is left out, either for ordinary intelligence to suggest or for the natural course of events to supply. There are to be three grades of general scientific teaching; three examinations in technical instruction, each with its own certificate of excellence; and three kinds of teaching bodies—the industrial institute, the technical college, and the central university. This last, moreover, is to exercise a perpetual and searching superintendence over the whole scheme, so as to secure absolute uniformity of action in all the parts; it is to prepare all the text-books of science and manuals of trade, from which alone the teachers are to give their instruction, and from which alone the questions in examination are to be set. Add to this that technical teaching is to become a department of State administration, because "*the Government is the embodiment of the national will*," and there is presented a system which would no doubt be for a time intensively stimulative, but which as certainly, if it could last, would result in worse than Chinese monotony and worse than American corruption. It is unfortunate also that Mr. Twining is too absorbed in his central university to pay sufficient attention to some minor proposals towards the same object, which are more immediately practicable. He alludes, indeed, to a revival of the ancient practice of apprenticeship, but in ambiguous and despondent language; he hardly refers at all to the possible future which may yet be in store for the City Companies; and nowhere throughout the volume is there any mention of trade-unions, without whose co-operation, at least, it is vain to attempt to influence on a large scale the more important national industries.

Into the literary style of this book it were ungracious to look with an hypercritical eye, for Mr. Twining has done so much in the cause of scientific teaching that he can afford to write loosely about it. The reader, however, will wish that in a work of this pretension he had not adopted that singular method which is no doubt invaluable for giving clearness to a syllabus of lectures.

The pages are absolutely disfigured with capital letters, and the whole book is cut up into a bewildering number of chapters, sections, and subdivisions. It is necessary also to protest against the growing tendency, here profusely exemplified, to borrow needless synonyms from the Greek and other languages. "Autonomous" should not be used where "independent" would better express the sense, and "paraphernalia" has not the same meaning as "apparatus." Before concluding, it should be mentioned that there are to be found scattered through the volume lists of books and pamphlets dealing with the main questions treated of, which not only illustrate the great labour which Mr. Twining must have undertaken, but also point to a repertory of information which cannot be neglected by any one who shall hereafter interest himself in the same subject. JAS. S. COTTON.

Gerald and his Friend the Doctor. A Record of the Experiences of certain Young Men. By the Rev. Henry Solly. (London: Chapman & Hall, 1874.)

FEW books have had trumpets blown more sonorously before them than *Gerald and his Friend the Doctor*. First, "with honour, love, and hope," Mr. Solly dedicates his tale to the memory of the late Mr. Maurice. Next he addresses a long and verbose letter to his "dear Lord Lyttelton." Less fortunate than Mr. Maurice, Lord Lyttelton and Mr. George Macdonald have "toiled," it appears, "through this work in manuscript." As the work is equivalent to about five volumes of a common novel, it does Lord Lyttelton no small credit that he has survived to reply in amoebean strains to Mr. Solly's dedicatory letter. Lord Lyttelton tells us—and as he has toiled through the work he ought to know—that "no one would seriously compare the coarse daubing of *Joseph Andrews* with the delineation of high and pure principle in these volumes, any more than those who know Henry Solly would do him the injustice to compare his character with that of Henry Fielding." We quite agree with Lord Lyttelton, that no one would be the least likely to compare *Gerald and the Doctor* with any masterpiece of English literature. Both Mr. Fielding and Mr. Solly are named Henry, and both introduce their readers to a great deal of bad company, but there all resemblance ceases. Mr. Solly's novel is a novel with a purpose. So far it is no worse than prize temperance tales. But as Mr. Solly's mind is wholly bent on pointing out the evils of a crying sin which is not drunkenness, his tale is much more repulsive and nasty than the feeblest fanaticism of temperance. It is curious that there should still be people who believe that a great amount of unctuous talk about sin, and several horrible examples, can make a story interesting, or its readers virtuous. Surely no one needs to be dragged through the mire of the lowest undergraduate and medical student life, to learn the merits of common decency. The characters in this book are not more refined, or more modern than Tom and Jerry. Their very slang is musty, the "saloons" they haunted are as obsolete as the cities of the Plain.

They speak of "dead smites," they call their friends "quizzes," and dressing they style "Adonizing." They fraternise with policemen, and speak of each other as Growling Bob and Knowing Ned. Their whole existence is like the seamy side of the life of Bob Sawyer, and Ben Allen.

This grossness is probably intended for realism, and the pictures of vulgar profligacy are no doubt meant to deter the young from what Mr. Solly considers "vice, even in its most specious and less repulsive forms." His idea of vice which has lost all its coarseness he states thus: "Flitting irresponsible visits to hotels, coquettish waitresses and chambermaids." These lovely beings people the Arnida's garden of Mr. Solly's most refined imagination, and it may easily be guessed what improving company his worse characters are for the ordinary novel reader. In fact, his story is excessively offensive, and the grossness of the ideas is not redeemed by any merit of execution. The subject is quite unfit for the usual public of the novelist. It required all the wit and the tragic power of Mr. George Meredith to save the *Ordeal of Richard Ferrer* from a similar condemnation. Mr. Solly gives us ancient slang for wit, and mean horrors for tragedy. The name of the young men whose experiences Mr. Solly relates in such detail, is Legion. From the ruck of medical students and undergraduates of the baser sort, three characters stand prominently out. First there is Gerald himself, the Galahad of this romance. Gerald was fond of the *Beauties of Byron*, and deeply affected by the *religio loci* of the London University. He was eager to elevate the masses, and thought he could best do this by becoming a dramatic poet. But his father, Mr. Arlington, kept him at work in his counting-house, whence he only emerged, we are told, to be the light of the highest circles, and to talk aesthetics to Miss Leila Featherstone. Miss Featherstone, known in the highest circles as "the Beautiful Panther," did seriously incline to talk aesthetics till she fell in love with Harry Fortescue, "the doctor," a friend of Gerald's, and of her own brother's, Alfred Featherstone. Both Alfred and Harry are divided between ruffianly profligacy and lofty aspirations. Leila is no less divided between Galahad and Launcelot, Gerald with his Schiller, and Harry with his life-preserver. Harry tells his love, and Gerald is more diffident. "In the lonely night-watches" the Beautiful Panther consoles herself with writing a poem which ends thus:—

"Then would this foolish heart be still,
And find its earthly rest in thee [Mr. Fortescue].
Nor ever care again to know
If friend of thine [Gerald] cared aught for me."

"At last she took her trouble where alone she could find relief"—and so on. Now Harry, on the whole, was winning easily, when it occurred to Alfred Featherstone to lower his friend's moral tone, and unluckily Leila met her lover when his moral tone was at zero. She was naturally a good deal hurt, and Gerald would have had it his own way, only he was publishing a dramatic romance which was damned by the *Weekly Snarler*. On this matter Mr. Solly, who is himself the author of "*Gonzaga, a Dramatic Tale*," speaks with some feeling. Meanwhile

all the characters except Gerald, and Harry, who has intervals of remorse in which he tries to brain his friends, go rapidly to the dogs. Gerald's brother, Richard, is very like Gerald, and uses this resemblance to seduce a servant girl named Jessy, with whom his brother has Platonic relations.

Alfred is shut up in a mad-house, and, after what is told of his manner of life, we do not wonder at it. Gerald marries Leila, and fondly addresses that Beautiful Panther as his "ducky." Soon after their marriage she hears of the affair of poor Jessy, believes her husband to be guilty, and her health, at the moment peculiarly interesting, gives way. Richard is killed in an accident, but relieves Leila's mind by making a confession before his death. All this part of the plot is as nauseous as it is improbable. We hurry to a conclusion. Harry weds some lady less enlightened, or less particular, than Leila. Gerald addresses the family circle as "Oh, ye beloved individuals." The entertainment closes with prayer and a hymn. We should mention that a sermon of Mr. Maurice's is reprinted in the second volume, without any extra charge.

The book is the most colossal and tedious tract that misguided zeal ever compiled. It is impossible to imagine a work less likely to benefit a man, and more certain to disgust a woman. Nothing we have said conveys an idea of the unction, the raptures, the gush, the flatulent enthusiasm of this offensive production. A. LANG.

CURRENT LITERATURE.

THE second edition of Mr. Fitzjames Stephen's *Liberty, Equality, Fraternity* (Smith, Elder, & Co.), has a preface of some fifty pages, besides foot-notes and some small additions to the text, in answer to the criticisms on the work in the *Fortnightly Review* (June and August 1873), by Mr. Morley and Mr. Frederic Harrison. In this Mr. Stephen explains more fully the grounds of his objection to Mr. Mill's view that self-regarding actions should be free; namely, that the distinction between self-regarding acts and acts that regard others is itself "altogether fallacious and unfounded;" a position which is not easily reconcilable with the main argument of the book—that personal hopes and fears are the only efficient motives of conduct; for if "men are so connected together that it is scarcely even possible to think of oneself except in relation to other people" (p. xii.), it must be equally difficult to act for oneself, or one's own interest, without relation to other people, whose interests might therefore be a part of the ordinary motives for action. The author disclaims the decided convictions on the subject of future rewards and punishments attributed to him by Mr. Harrison, and only maintains that practical morality cannot but be affected by the belief, or absence of belief, in a "Hereafter." And he shows, with some success, that Comte's theory of the temporal and spiritual power as expounded by Mr. Harrison, leaves much to be desired both for practical and philosophical purposes. The dispute is enlivened by a good deal of fierce but seldom ill-natured fencing; only, as all three writers are anxious not to be more dull than the nature of their subject imperatively requires, all are a trifle over-hasty to seize every opportunity that offers of applying their opponent's phrases so as to turn the laugh against him, a proceeding which always has the effect of reminding the person so treated that the subject is too important for trivial jesting. The additional matter no doubt helps to bring into relief

the real nature of the point at issue. Mr. Mill and Mr. Stephen agree that society is made up of a few wise and many foolish men. They agree that it is desirable for the conduct of all to be guided by wisdom. Mr. Stephen has so much faith in the power of wisdom that he believes that, if the many and the few fight for supremacy, the wise minority will win the power of coercing the foolish majority; and that it is right—i. e., for the greatest happiness of the greatest number—that they should exercise this power when they have it. Mr. Mill believed that it was for the greatest happiness of the greatest number that both parties should agree to waive their natural liberty to fight out their differences *ri et armis*, and he carried his faith in the natural power of wisdom to the point of trusting that the moral ascendancy of the minority would be as influential as any government by physical force. Mr. Stephen omits to notice one objection to a policy of coercion in the interests of the moral improvement of the governed—namely, that an act done from fear of punishment is not the same as the same act done from choice, for the intention of the agent is a part of the moral identity of an act; and if the only object is to avoid collision with the policeman, that may be done as easily by evading the letter of the positive enactment as by observing its spirit—a fact which might be abundantly illustrated from the history of any system of law that chances to be either in advance or in arrear of the opinion of the people professedly subject to it. Mr. Stephen does not credit the masses with wisdom enough to recognise the wisdom of their betters when they see it; and obedience to a despotic government, however beneficent, unless it is a voluntary tribute to its wisdom, cannot develop any moral habits in the governed; they only strengthen by exercise the habit of yielding to superior force; and Mr. Mill would have argued that a people so trained would sooner or later demoralise any fallible human ruler.

The Lincoln Pocket Guide. By Sir C. H. J. Anderson, Bart. (Lincoln: Cousins, 1874.)

LINCOLN was one of the most important cities in England, alike in Roman, pre-Norman, and Plantagenet times, and yet nothing worth naming has been done "to set forth its antiquities." Most of the little towns of Lincolnshire have histories of more or less value, but for the capital of the county there has been done absolutely nothing worth remembering. Sir Charles Anderson's little book makes no pretension to be anything more than a guide-book. As such it contrasts most favourably with the vulgar trash that is too often printed and sold by country stationers under that name.

The information is rigidly compressed, but room has been found for a line or two, directing attention to almost everything in the city worthy of note. Unlike most books of its class we have more than the title-page promises. Attention is directed to nearly all the important architectural remains of the county, and there are noteworthy passages ancient dialect and folk-lore. The list of the gentry of Lincolnshire in 1672 is a very useful and accurate contribution to local history.

The Dr. Farmer Chetham MS. Edited by Rev. Alexander Grosart. (Chetham Society, 1873.)

THIS is an imprint of a manuscript common-place book in the Chetham Library. It does not contain much that has not been printed elsewhere, and the little that is new is not very important. The first article is "The Arraignment of the Earles of Essex and Southampton." This, the editor assures us, is a much better text than the one given in *The State Trials*. It is, he believes, an account written by one who "saw and heard all he tells."

Among the verse is a string of rhymes, "Of English Beastes," which we do not remember to have come upon elsewhere in print or manuscript. It begins:—

"The kindes of beasts be twenty eight in England yt do breed

Thirtene do noye, six pleasures serue, nine only do vs feede."

The virtues and vices of the several beasts are duly set forth in the succeeding lines. The "Lob-starr" is accused of killing comies. Considering the opinions prevalent on natural history when this book was compiled, we should not feel much contempt for any one not a native of East Anglia who understood thereby a certain well-known crustacean. The stout was the "beast" the writer really meant, but there should certainly have been a note to tell us so.

This verse writer gives us other interesting information; as, for instance, that hedgehogs suck cows, that the "finest penecyles" are made of the squirrel's tail, and that the dormouse

"On sharpest point and keenest edge, it will both sit & creepe,

Which idle dames delight to see & then to lull asleepe."

Wordsworth, Shelley, Keats, and other Essays. By David Masson. (Macmillan & Co.) The most recent of these essays are more than twelve years old, and though they have a good deal both of subtlety and of depth, most of them have rather suffered by the fact that we have silently discovered for ourselves a good deal of what Professor Masson has established for us. This is especially the case in the essay on Wordsworth. The essays on Theories of Poetry and Prose and Verse, seem rather obsolete, since we have come to realise that all literature has been developed out of poetry. The personal descriptions both of Keats and Shelley are admirably clear and delicate: the author succeeds better in appreciating the poetry of Keats. In speaking of Shelley, he dwells too exclusively on the suggestive inconsistency between his ethical transcendentalism and his idealisation of Nature as opposed to God. The essay on Scottish Influence in British Literature would be better if the writer had treated of Scotch patriotism as a phase of the Scotch talent for emphasis, rather than Scotch emphasis as an outgrowth of Scotch patriotism.

Tramps in the Tyrol. By H. Baden Pritchard. (London: Tinsley Brothers.) *Tramps in the Tyrol* professes to be a joint account of the adventures of four members of the so-called Tittlebat Club, by name Brown, Green, Black, and White. To criticise this production seriously would be impossible, for there is nothing in it worthy of criticism from the first page to the last. The opening chapter is taken up in starting the pedestrians and settling the straps of their knapsacks, the second is a *réchauffé* of the feeblest jokes possible, on passing the Austrian customs, on British eccentricity and British obstinacy, and these faded witticisms obtrude themselves throughout the book *ad nauseam*. The descriptions of scenery are but slight and very poor, and the greatest adventure on which the valiant four pride themselves is their courageous escape from a cordon of expectant waiters who had assembled on the Lake of Lugano, at the little landing-place, to seize on them as lawful prey, the fixed and unalterable resolve of our heroes being to proceed direct to Maggiore at once. To the immediate friends of the Tittlebatonians, the book may, under abnormal conditions, possibly be of some slight interest. We can only say we laid it down, after a cursory perusal, with a feeling of surprise that anyone could pass through such scenery as the Tyrol affords and find so little to tell us that was worthy of record. EDITOR.

NOTES AND NEWS.

THE first volume of Professor Corssen's book, *On the Language of the Etruscans*, will be published early in September. It will be a large book, the first volume consisting of sixty-one sheets royal octavo, and twenty-five plates.

WE understand that an English translation of Gregor Samarov's *Am Zepter und Kronen*, which was published about a year ago in Germany, when it created a very great sensation among all classes, will shortly be issued. It deals with some of the most prominent characters who have figured, and still continue to figure, in European politics; and the accuracy of its life-picture is so great, that it is presented to the English public not as a novel, but as a new rendering of an important chapter in recent European history. It is translated by Miss Fanny Wormald, and will be published by Messrs. Henry S. King & Co.

THE same firm will publish during the coming season a translation by the Princesses Ouronoff of B. Markewitch's novel, entitled *Une Question Oubliée*. It will appear in English as *The Neglected Question*, and will be dedicated by special permission to Her Royal Highness the Duchess of Edinburgh.

AMONG other works of fiction to be issued by the same publishers, we note that *Malcolm*, a Scottish story, by George MacDonald, is nearly ready; and stories by Julian Hawthorne and the author of *Thomasina* will both be shortly issued. The title of Julian Hawthorne's new romance is *Idolatry*. The story by the author of *Thomasina* is entitled *Vanessa*.

A NEW edition of the *Older and Modern Ballads of Lancashire*, which were edited by the late Mr. John Harland, F.S.A., the Manchester historian and antiquary, some years ago, will shortly be published by Messrs. Routledge and Sons. Some new matter will be included, and, in the shape of introductory matter, an essay on the Ballad literature of the County Palatine will be given.

THE University of Tübingen will lose one of its most distinguished professors, Dr. Trumpp, who has been called to Munich as Professor of Persian and Arabic. Dr. Trumpp has spent many years in India, and has been commissioned by the Indian Government to publish *The Granth*, the sacred writings of the Sikhs. This work will soon be ready, and promises to be of great interest, not only for the history of religion, but also for the history of the modern languages of India. Dr. Trumpp is best known as the author of a grammar of the Afghan language, in which he claims for that language a closer relationship with the Indian than, as was formerly supposed, the Iranian dialects.

MISS BRADDOX's new novel, *Lost for Love*, is to be published by Messrs. Chatto and Windus on the 15th instant.

A SECOND edition of Mr. Swinburne's *Boothwell* has just left the printer's hands. We understand that Mr. Swinburne is now engaged on a critical essay on the Life and Works of George Chapman, to be prefixed to the second volume of the complete edition of his works, of which the first volume has recently appeared.

THE Imperial Archives of Vienna, in addition to the letters and despatches of Eustace Chapuys examined by Mr. Froude, contain other series of correspondence relating to English affairs in the sixteenth century, which will be transcribed, or abstracted, for the Calendar of Foreign State Papers, edited by Don Pascual de Gayangos. Of special interest, it is believed, are the letters, &c., of Don Inigo Hurtado de Mendoza, bishop elect of Segovia, and of Francois Vanderbilt, who resided in England until 1548. There is also the official correspondence of Jacques de Caestres, M. de Marnie, M. de Montmorency, Siepperus, and others sent from time to time on special missions; besides numerous letters of Cardinal Wolsey, Secretary Cromwell, Bryan Tuke, and Richard Wingfield. Those of Queen Catherine, though not so abundant as at Simancas, are said to be highly interesting and written entirely with her own hand. Almost all the ambassadors of Charles V. in England were natives of the Low Countries, Flemish or Burgundians.

THE *Nation* announces that Professor Bonamy Price is about to visit the United States, leaving England on September 20.

The Chinese Reader's Manual; a handbook of biographical, historical, mythological and general literary reference, by Wm. F. Meyers, Chinese Secretary to H. B. M.'s Legation at Peking, has just been issued from the American Presbyterian Mission Press at Shanghai.

PROFESSOR BERNHARD TEN BRINK, of Strassburg, has announced a treatise, "Studies on English Phonetics and English Metres," for the series of publications which he and Professor Scherer, of Strassburg, are editing for Karl J. Treibner, of that town, and which is entitled *Quellen und Forschungen zur Sprach- und Culturgeschichte der Germanischen Völker*. Professor ten Brink is now working at his concise History of English Literature, and hopes to finish the first part by December, and to publish it next April.

A *Grammar of Political Economy*, by Major-General W. F. Marriott, C.S.I., late Secretary of the Government of Bombay, is about to be issued by Messrs. Henry S. King and Co. The author's aim in presenting this new elementary treatise to the world is, firstly, to restrict it to truly elementary considerations in each branch of the subject; secondly, to adopt a perfectly precise and unambiguous use of terms in the sense which most nearly agrees with common use; thirdly, to offer reasonable proof of every proposition; and fourthly, to attain the utmost brevity consistent with proof, so as to invite and facilitate the judgment of the student as well as of the critic.

DR. EMIL BERNARD, of Bonn, has just published a small treatise of ninety-four pages, entitled *William Langland* (London, D. Nutt), in which, after a few notes upon the poem of *Piers the Plowman* and its author, he proceeds to analyse the spelling of the words in the B-text, and to make numerous useful notes upon the grammar, with references to the passages where the peculiar forms occur. The best portion of the book is the careful and very full account given of the system of orthography; an account which is particularly well-timed, now that early English pronunciation is attracting some attention. The vowel-sounds are distinguished according to their Anglo-Saxon or French origin. Thus the A.S. *æ* becomes a in *after* (A.S. *after*), and e in *elde* (A.S. *ælde*); whilst when followed by *g* it gives rise to the diphthongs *ai*, *ey*, *ei*; as in *faire* (A.S. *fæger*), also spelt *feire*; and in *fayne* (A.S. *fægen*). Such a collection of results cannot but be useful; and it is encouraging to find that Early English is studied in Germany with at least as much care as here. It is only in England that *atone* is derived from *tone*.

It is announced that M. Emile de Girardin, notwithstanding his advanced age, has undertaken the chief editorial direction of *La France*, which recently passed into the hands of his old friend, M. Genty, and it is added that he will enter upon his duties on November 1.

THE Roman correspondent of the *Allgemeine Zeitung* states, that in consequence of Father A. Theiner having died intestate, all those of his works, either complete or still incomplete, that have been compiled from materials belonging to the Archives of the Vatican, will be considered the property of the State department from which they were derived. Theiner possessed, however, a very large private library, which is considered to stand unrivalled in regard to the value of its works on canon law and church history, as well as on universal history, and it is rumoured at Rome that this important collection will be sold by public auction. In refutation of this expectation it is stated, on the other hand, that two years before his death Theiner made over his library to the Archbishop of Olmütz, in consideration of receiving a fixed annual payment during his life,

while he at the same time retained the use of the books. It is understood that, in accordance with the agreement then entered into between the Oratorian brother and the German primate, the value of the books was to be assumed to be 10,000 German thalers, on which the former was to receive 10 per cent. annually, and as he only lived two years after this compact was entered into, the archbishop, who has bequeathed the collection to the clerical seminary of Olmütz, has been enabled to enrich his diocese at a very small cost.

AN English translation of Professor Ribot's important work on Heredity, a psychological study of its phenomena, laws, and consequences, will be issued by Messrs. S. King and Co. It is generally admitted that Heredity—or that biological law by which all living creatures tend to reproduce themselves in their descendants—is the rule in all forms of vital activity. The author devotes his work to the study of the question—"Does the law also hold in regard to the mental faculties?" Messrs. King and Co. have also in preparation a book entitled *The Physics and Philosophy of the Senses*; or, the mental and the physical in their mutual relations, illustrated by several plates, in which the author's object is twofold: first, to supply a manual of the senses, embracing the more important discoveries of recent times; second, in discussing the subject of Life, Organisation, Sensibility, and Thought, to demonstrate, in opposition to the Materialistic theory, that the Senses, no less than Reason, furnish proof that an immaterial and spiritual element is the operative element in nature.

THE *Geographical Magazine* announces that the India Office has resolved to print the account of Mr. Burgess's recent researches in the Bombay Presidency, together with its accompanying illustrations. The report contains an exhaustive notice of his discoveries at Belgam, Konur, and Badami, at which latter place are some highly interesting sculptured caves, a complete delineation of which, with a few casts, would form a valuable illustration of Hindu art and Vaishnava mythology—only to be rivalled by what Ajanta affords of Buddhism. Mr. Burgess has brought home altogether fifty-four photographs, between twenty-five and thirty rubbings of inscriptions, about forty ground plans, sections, and drawings of columns, &c., and forty sketches of sculptures.

REGARDING Mr. Betty, the "young Roscius," whose death was announced last week at the ripe age of eighty-three, we extract the following passage from Leigh Hunt's *Autobiography*:—

"His position, which appeared so brilliant at first, had a remarkable cruelty in it. Most men begin life with struggles, and have their vanity sufficiently knocked about the head and shoulders to make their kinder fortunes the more welcome. Mr. Betty had his sugar first, and the physic afterwards. He began life with a double childhood, with a new and extraordinary felicity added to the natural enjoyments of his age; and he lived to see it speedily come to nothing, and to be taken for a very ordinary person. I am told that he acquiesces in his fate, and agrees that the town were mistaken. If so, he is no ordinary person still, and has as much right to our respect for his good sense, as he is declared on all hands to deserve it for his amiable nature. I have an anecdote of him to both purposes, which exhibits him in a very agreeable light. Hazlitt happened to be at a party where Mr. Betty was present; and in coming away, when they were putting on their great-coats, the critic thought fit to compliment the dethroned favourite of the town, by telling him that he recollected him in old times, and had been 'much pleased with him.' Betty looked at his memorialist as much as to say, 'You don't tell me so!' and then starting into a tragical attitude, exclaimed, 'Oh, memory! memory!'"

THE aged poet, Runeberg, the greatest scald that Sweden has ever had, has been in extremely weak health for many years past. It appears that as he has lain on his sick bed, at Helsingfors in Finland, he has occupied himself by close observation of the habits of birds, and specially with regard to the causes of migration, and he has at

last put forward a singularly beautiful theory on the latter point. He believes, in fact, that it is the longing after light, and that alone, that draws the birds southwards. When the days shorten in the north, the birds go south, but as soon as ever the long northern nights set in, with all their luminous and long-drawn hours, the wanderers return to their old haunts. It is generally supposed that they move southward to get more abundant food; but why, asks Runeberg, do they leave their rich hunting-grounds to return to the north? The central regions of Europe are in every way more desirable than the wastes of Scandinavia. Only one thing is richer there, and that is light. The same instinct that makes plants firmly rooted in the ground strain towards the light, spreading upwards in search of it, works in the birds, who, on their free wings, fly after and follow it. This very suggestive and poetical notion is further carried out by reference to various analogies in natural history, and the final sentence is quite epigrammatic: "The bird of passage is of noble birth; he bears a motto, and his motto is *Lux mea dux*."

A CURIOUS trial has lately taken place at the Tribunal de Commerce de la Seine relative to an Aldine Horace. M. Gromier, a bookseller of Bourg (Ain), purchased in a sale with some other books, which he bought for a trifle, an Aldine Horace, dated 1509. He placed it in a book cover of Grolier which had adorned another work and priced it in his catalogue at 500 francs. It was purchased by the Comte de Jonage. M. Bachelin Deflorenne, the well-known buyer of old and curious books, applied for it to M. Gromier, who referred him to Count de Jonage; this last expressed his willingness to part with it at the price of 2,200 francs, and sent M. Bachelin Deflorenne at the same time a designation of the book, setting forth that it was a Horace of Aldus, dated 1509, in a Grolier binding of red morocco, with his customary inscription, "Johannis Grolieri et amicorum." On receipt of this description, the bargain was concluded; but when it was once in his possession, M. Bachelin Deflorenne declared that his employers refused to accept the volume; that though the book was edited by Aldus, it was not in a Grolier binding made expressly for Grolier, and that consequently the book had never belonged to Grolier. Count Jonage persisted in his demand to be paid the 2,200 francs, declaring he had concealed nothing from his purchaser, that the description he had sent M. Bachelin Deflorenne was perfectly correct, that the Horace edited by Aldus in 1509 was in a Grolier binding, and that he had only guaranteed the date of the edition and the authenticity of the binding and that M. Bachelin Deflorenne, an "expert" himself, must have well known from Leroux de Linçy's catalogue of the Grolier library, that the only edition of Horace which belonged to Grolier was of the date 1527, and not 1509.

It was in vain M. Bachelin Deflorenne pleaded it was not likely he should have given Count Jonage 2,200 francs for a made-up volume, for which it appeared the Count had only paid 200 francs. The tribunal gave the following judgment:—

"That the book answers the description furnished by Count Jonage, upon which the bargain was concluded; and that if the defendant pretends that he should have had a book with the text of 1509 and primitive binding, the error is his. In his profession of bookseller, and specially of old books, he should have known that the only edition of Horace that belonged to Grolier was that of 1527; that as the parties had agreed upon the price, the sale was good; and that consequently the defendant is sentenced to pay the 2,200 francs claimed, with interest, and the costs of the suit."

ANOTHER Chaucer disappointment. Mr. Walford D. Selby, of the Public Record Office, who is searching the whole of the records during Chaucer's manhood for traces of him, made sure that among

the receipts for pensions of wine must be some of Chaucer's, sealed with his seal, for the daily pitcher of wine granted on April 23, 1374, "dilecto armigero nostro, Galfredo Chaucer." But no; all the receipts after 46 Edw. III. are lost. However, on Oct. 15, 1398, Chaucer got from Richard II. a grant of a tun of wine yearly, from December 1, 1397; and for one delivery of this, in 1399, Mr. Selby has found a fragment of a receipt, half the document and its seal being gone. This is the more annoying, as all the documents on the same file are perfect. Among these wine receipts are two from the poet Gower, with his seal attached. Gower's seal is merely a shield with a chevron. The text of his first receipt, Nov. 24, 1399, is as follows:—

"Noverint universi me Johanne Gouer recepisse die confectonis presencium de Johanne Payn Domini Regis pincerna capitali duas pipas vini de Vasconia quas de dono Regis ad terminum vite mee annuatim percipere (sic) debio. De quibus duabus pipis vini pro presenti anno fateor me fore pagatum et predictum Johannem Payn inde quietum. In cujus rei testimonium sigillum meum apposui. Datum vicesimo quarto die Novebre anno regni Regis Henrici quarti primo."

In the second receipt, dated Nov. 4, 2 Hen. 4, the name is written Gower. [Exch. Queen's Remembrancer. Ancient Miscellanea. Pincerna Regis. Bundle 658.]

There are also hundreds of receipts to Thomas Chaucer as "Pincerna Regis," with the seals of the persons giving them affixed. Mr. Selby's account of the two robberies of Chaucer, on Tuesday, September 3, 1390, at Westminster, and at Hatcham, in the county of Surrey, has gone to press for the Chaucer Society. It gives all the documents connected with the robbers and their fate, from the Coram-Rege and Controlment Rolls.

"AN American view of Emigration" in the *Fortnightly*, by A. B. Mason, gives the impression (though there is no attempt to distinguish between the effects of permanent causes and a temporary depression of trade) that social conflicts in the future will have to be decided in Europe. Lord Lytton gives a sympathetic and discriminative account of Count Gobineau's curious romance of aristocratic despair. W. Boyd Dawkins shows that Ireland was probably the northern limit of the Basques, by a comparison of the skulls found in caves at different points with the complexion of the existing population, and by showing, after M. Broca, that the limit of height in France varies in the same way as the complexion of the inhabitants. The editor gives a *précis* of Mr. Flint's *précis* of French and German theories of history.

In the *Contemporary Review*, Vincent H. Stanton has a candid article on the Ethical Teaching of Christ. He does not get beyond establishing that it contains valuable elements with which we cannot afford to dispense, and does not see that this is inadequate. Dr. Charlton Bastian, on Heat and Living Matter, seems to prove that the school of Pasteur fail to explain his experiments in which infusoria appear in sealed vessels that have been exposed to high temperatures. On the other hand, he has not explained Pasteur's experiments in which infusoria appear or not as germs are admitted or excluded. E. Fairfax Taylor on Longevity, argues that, as some *soi-disant* centenarians are proved impostors, we are not to take any *soi-disant* centenarian's bare word for his age. Mr. Arthur Arnold's reply to Mr. Greg is plausible and vigorous; Lord Lytton's dignified and delicate.

In *Macmillan* Mr. Fleay, in an article headed "Who wrote our Old Plays" rewrites a passage of Otway in the metrical manner of seven or eight writers, beginning with Fletcher and ending with Greene, and applies his metrical tests to *Cymbeline*, with the result that it was begun in 1606, completed between 1607 and 1608, and that act

iv. scene 2 was written separately, as shown by the large proportion of rhymes, and the correct pronunciation of Posthumus. Professor Cairnes' reply to Professor Goldwin Smith on Woman Suffrage is what might be expected from a philosophical and consistent Liberal.

In *Temple Bar* there is an amusing and curious account of the time when pictures were bought for the rational purpose of ornamenting rooms, under the title "Bought and Sold in the last Century."

In *Cornhill*, "Maids of all Work and Blue Books" is an account of the unsatisfactory condition of girls sent to service from district schools. "The Danish National Theatre" is full and clear and sensible. "A Witch Trial in the Fourteenth Century" is an account of the ceremonies with which two women were convicted and burnt at Paris for trying to bewitch a man who had deserted the younger of them.

In the *Saturday Journal*, "The Swing," by Walter Bryce, a young and versatile poet, has a strong taste of Landor's honey. In the *Day of Rest* Mr. Proctor completes his quaint theory that as the earth existed long before it was capable of supporting life, and the moon has long been incapable of supporting life, all the heavenly bodies support life at some part of their existence.

In *Good Words* Mr. George M. Grant gives an account of the Northern Rocky Mountains. In the *Atlantic Monthly* the most remarkable thing is a description of Mr. Moran's pictures of the southern part of the same region, which, according to the painter, is "like hell." G. P. Lothrop's article in the *Atlantic* on "The Novel and its Future," is remarkable for a very high estimate of Turgenieff and Bjørnsen.

NOTES OF TRAVEL.

THE *Finanza* of Alexandria, under date August 6, writes that an expedition is being started in Egypt to survey the physical and geological formation of the Valley of the Nile and the territories adjacent to the Red Sea. One of the most important questions left for the decision of the expedition is the project to direct the waters of the Nile into the bed of an ancient river that formerly flowed through the valley, still called by the Arabs "the valley of the dry river." Should this project be found feasible, it will result in the fertilising and cultivation of vast tracts of land now desert and sterile.

ACCORDING to the *Levant Herald*, a calamity similar in kind to that which has befallen the Thames at Richmond happened on the 16th ult. to the river Carvitch, near the village of Dogha, in Bosnia. The stream, we are told, suddenly ceased to flow, and its bed became dry land. More fortunate, however, than the dwellers by the Thames, the Doghans, after only two hours of anxiety, were relieved by seeing their beloved river resume its wonted course. Sewage and a Dogha Conservancy being happily unknown, they were able to lay in a large stock of fish, which were left high and dry by the failure of the water, and seem in the end to have alone had a right to complain of this wholly unjustifiable freak.

AT the last sitting of the Berlin Geographical Society, it was announced that a letter had been received at the Foreign Office from Dr. Nachtigal, dated April 20. The renowned African traveller writes that he was in good health, that he had received money and letters, and that he contemplated setting out towards home in May, by way of Kartoum, as he considered he had accomplished his task.

THE new nickel coinage which is proposed in Germany, and which has hitherto been expected almost to equal the silver coinage in value, will probably be much cheapened by the discovery of a very rich bed of nickel in the forest of Glörlach,

in Norway. The ore contains 3.50 per cent. of pure metal, a far larger supply than has hitherto been obtained from any mine.

THE pine forests on both sides of the boundary dividing the provinces of Nyland and Tavastehus, in Finland, appear to have been suddenly desolated by the ravages of a great caterpillar. The *Helsingfors Dagblad* describes this plague in minute terms, which leave no doubt that the insect is the larva of a hawk-moth, in all probability *Sphinx Pinastri*. More than 6,000 acres of forest have been entirely destroyed, the larvae stripping off leaves and bark, and leaving nothing but this year's shoot.

FROM the *Levant Herald* of the 15th ult. we learn that the accounts from the famine districts in Asia Minor were daily becoming more alarming, and that the prospects of the coming year inspire grave anxiety and call for energetic action on the part of the Government. The headquarters of the famine are comprised in a district of over 40,000 square miles, lying between Angora, Koniah, Nigdeh, and Tokat. Taking the most moderate estimate, the deaths from starvation and disease have already amounted to 150,000, and it is feared that a famine of still greater intensity is inevitable in 1875. Brigandage and violence were adding to the misery of the famine-stricken districts. If left to itself, without great efforts from the Government, it will be utterly impossible for the country to rally even in the third year.

THE same journal strongly deprecates the obstructive policy of the Ottoman Government, which has hitherto deferred giving its consent to the establishment of an English company in Anatolia for the working of the large mines of lignite existing in the mountainous ranges of that province. The company has been in existence for two or three years, and is prepared to work the mines effectually and also to construct a railway to Magnesia for the conveyance of the mineral not only to that town, but to Smyrna and all the surrounding districts. A supply of this combustible would be of the greatest value, for the inhabitants of that populous and industrious district are now dependent on brushwood as their only fuel, for their numberless brickyards, distilleries and manufactories. In all other European states, says the *Herald*, the employment of foreign capital and foreign industry is welcomed with pleasure; the Ottoman Government alone discourages any foreign enterprise whatever, and the country suffers accordingly.

THE correspondent of the Russian *Gazette de l'Académie* writes that an Englishman of the name of Hobham was organising a colossal undertaking which was to cost five million roubles, and was nothing less than the diversion of the waters of the Arpatchai into channels to be cut throughout the length and breadth of the vast desert plain of Sardar Abad, for its thorough fertilisation and cultivation. Mr. Hobham has already obtained the grant of the plain from the Russian Government; the works have commenced, and Mr. Hobham hoped to attract 100,000 Irish and German emigrants to settle on the reclaimed lands.

DR. HEINRICH SCHLIEFMAN has sent an account to the *Allgemeine Zeitung* of a visit which he and his wife have recently made to Thermopylae, Mount Parnassus, Delphi, and other spots sacred to history and art. After making their first stop on the island to which Patroklos, the admiral of Ptolemy Lagos, has given his name, and where the fortifications which he raised may still be indistinctly traced, and rounding Cape Sunium, the southernmost point of Attica, the travellers made a careful examination of the remains of the neighbouring Temple of Athene, whose thirteen Doric pillars, with their well-preserved architraves, may be seen far off at sea. This sacred fane, which is not generally enumerated among those erected by Perikles, is an undoubted relic of the best periods

of Hellenic art, and must have been erected about the year 422 B.C., at the time of the fifty years' peace between Sparta and Athens, and when Nikias, who was subsequently slain in Sicily, was still working his mines at Laurium with 1,000 of his own slaves. Whatever may have been the value of the returns yielded by those much-vaunted fields of gold, certain it is that in these days they have brought only disappointment and heavy losses to all concerned with them, and it would almost seem as if its memories were the only relics which the region yet preserves of its past riches and glories.

Leaving Sunium, Dr. Schliemann and his enthusiastic companion made their next resting-place on the plains of Marathon, where, not far from the water's edge, may still be distinctly traced the outlines of the lofty mound under which were interred the 192 Athenians who fell by the hands of their Persian foes in that memorable battle (490 B.C.). An hour's further ride brought them to the present village of Sykamino, on the Boeotian side of the Asopus, where a few ruins indicate the site of the ancient Oropus, taken and destroyed by the Thebans in the year 402 B.C. Here the ground on which the traveller treads is truly classic. On one side of him he sees in the Delisi of the present day the ancient Delium, which, with its harbour at Tanagra, and its temple dedicated to Apollo, was made memorable by the battle in which the Athenians were defeated by the Thebans, and where Alkibiades saved the life of Sokrates, who on his part secured the safety of the young Xenophon. On the other side lies the ancient Eretria, whose earliest history dates from Homeric times, and which, after sending forth its sons to fight at Salamis and Plataea, and joining with Sparta to humble the power of Athens, was forced in 198 B.C. to succumb to Rhodes, after having for a time been under the yoke of the kings of Macedon. Its rock-hewn theatre and the Cyclopean walls of its Acropolis are all that now remain to mark its site.

Still more interesting, however, are the ruins of the ancient Aulis, reared aloft on their steep rocky pedestal; for here at the foot of the lofty heights are the twin harbours which dispute the fame of having gathered within their waters the fleet of 1,200 ships which Agamemnon led forth for the capture of Troy. The northern bay, now known as Laspi, seems, however, to be alone entitled to claim the honour, since the southern harbour could scarcely, as Strabo remarks, have given mooring room to half a hundred galleys. Here, and at Chalkis, where a bridge unites Euboea with Boeotia, are unmistakable evidences in massive accumulations of rubbish and *debris* of every kind, that the exploration of the spot would reward the archaeologist with abundant results. But, as Dr. Schliemann remarks with regard to Delphi, under existing circumstances, while the finder must give up to the National Museum the half of what he recovers from his own land, it would be in vain to hope that any private individual would be disinterested enough to undertake costly labours of this kind.

At Iamnia, where Antipater was besieged for some months in 323 B.C. by the allied Greeks—who, after the death of Alexander, strove to throw off the Macedonian yoke—not a trace of a ruin can be detected for which a Hellenic origin could possibly be claimed. Pausing there only long enough to engage horses for the mountain ascents which he meditated, Dr. Schliemann and his companions crossed the Sperchios, which now embraces in its waters the ancient Dryas, Melas and Asopus, and after passing the hot sulphur springs of the Phoenix of Herodotus, where a hydropathic establishment now stands, he began the ascent to Thermopylae by the Anopaea pass, through which Ephialtes led the Persians. At the eastern entrance stands the mound mentioned by Herodotus, to which the Spartans retreated to make their last desperate stand, and till within the last few years the red marble blocks which had formed the pedestal of the monument erected to Leonidas

still remained. Now, however, they are all removed, and have been used to repair a neighbouring mill.

After ascending Mount Parnassus, and passing through Amphissa, the modern Salone, Dr. Schliemann went on to Delphi, now Kastri, and made a prolonged and careful examination of the entire *locale*. The place had been nearly destroyed since the travellers had visited it five years before, for in the interval nearly all its houses had been thrown down by the earthquakes of 1870, and now one common ruin envelopes the remains of the sacred buildings of old, and the poor dwellings in which recent generations have found shelter.

In Dr. Schliemann's opinion, the only possible means of penetrating to the buried treasures of the temple would literally be to leave no stone unturned, but to demolish every dwelling, and dig down till the very foundations of the temple were reached. This could only be done by purchasing the entire village, which might be done, the Professor suggests, at a cost of 200,000 francs. Here, then, is an opening for archaeological enterprise worthy of a millionaire. And if, as he surmises, no private individual will be found able and willing to enter the lists of exploration against the whole array of Greek diplomacy and bureaucratic restrictions by which it is now assailed, it is to be hoped that some Government may feel sufficiently rich and at peace with the rest of the world, to devote a portion of its surplus funds to the task of unveiling the seat of the ancient oracle of Delphi.

The Alpine Journal. No. 45. (London: Longmans & Co.)

The Alpine Club Map of Switzerland, with Parts of the Neighbouring Countries. Edited by R. C. Nichols, F.S.A., F.R.G.S., under the superintendence of a Committee of the Alpine Club. (London: Longmans & Co., and E. Stanford.)

THE current number of the *Alpine Journal* contains two papers on a new way to reach old peaks—one by Mr. Pratt-Barlow on the Grand-Paradis from Cogne, the other by Mr. Pendlebury on the Schreckhorn from the Lauteraar-Sattel. Mr. Holzmann contributes an elaborate and valuable account of the Ampezzo-Sexten-Auronzo Passes, and Mr. Bryce some interesting notes on Mountain Climbing in Iceland. The days of Alpine exploration, strictly so called, are nearly over, for a virgin peak is about as rare in the Alps as a bustard is in England, and mountaineers are already beginning to look further afield. Mr. Freshfield showed the way to the Caucasus in 1868, and one of his companions, Mr. Moore, has during the present summer successfully led a second expedition into the same region. It does not appear from Mr. Bryce's account that mountain climbing is exactly one of the attractions which Iceland offers to the traveller, for the difficulty, he says, is not so much to get to the top of the peaks as to reach their foot across the inhospitable desert which generally separates them from the inhabited parts of the island. Yet in the way of exploration there seems much to be done, if any one cares to do it.

However, if the Alpine Club has little left to conquer within its allotted territory, it has still much to do in the way of surveying and mapping its conquests. Much has already been done by Messrs. Reilly, Nichols, Tuckett, and others for the survey of various outlying parts of the main Alpine chain; and the maps which the first-named gentleman has from time to time published are a splendid monument of individual energy and devotion. It is well known that Mr. Reilly's map of the chain of Mont Blanc was the first to lay down many of the details of that complicated system with any approach to accuracy, and though his work may to some extent have been superseded in the map subsequently published by the French Etat-Major, yet it is no slight credit that the unaided work of a single amateur should be able to challenge comparison with that of a trained body

of engineers with all the resources of the French War Office at their back. But the isolated efforts of individual members have now been eclipsed by the publication, under the auspices of the Alpine Club, of the splendid "Map of Switzerland, with Parts of the Neighbouring Countries." This map has been ten years in preparation, and it has throughout been superintended by a committee consisting of Messrs. Leslie Stephen, Hall, Reilly, Blackstone, Longman, Moore, Whymper, Nichols, Blanford, Cowell, and Rivington,—names which are a sufficient guarantee that the best skill and knowledge which the Club could command have been brought to bear on the work. It is little to say that, next to the magnificent and unrivalled work of General Dufour, published by the Swiss Government, this is the best map of Switzerland to be found, for there is simply no other which can for a moment compare with it. The best existing maps profess only to be road maps, and, provided they give the main routes with accuracy, they are content to leave the mountains and glaciers and the secondary and lateral valleys to the taste of the engraver. The proceeding of the Alpine Club map is very different: it endeavours, within the limits of its scale (1 in 250,000), to give a faithful transcript of the country's surface, based on the latest and most accurate surveys. It may be doubted, perhaps, whether the scale adopted is the best that could have been chosen, but there are objections to almost any scale. A large one soon becomes cumbersome, a small one is incompatible with accuracy of detail; and the choice is a matter of delicate consideration which, doubtless, was carefully weighed by those who are responsible for it. Of course for the central parts of Switzerland the Federal map must still remain the standard authority: its larger scale (1 in 100,000) gives it an advantage which no care or delicacy of execution on a smaller scale can outbalance. But the bulk of the Federal map is a great disadvantage to the pedestrian; and here the comparison is, of course, wholly in favour of the map before us. Moreover, beyond the boundaries of the Swiss Confederation the Federal map is useless; indeed, it is worse than useless, for it is always bewildering and generally misleading, whereas the Alpine Club knows nothing of political boundaries, and carries its accuracy up to the extreme margin of the map. There is also much information in the new map which it is beyond the purpose of the Federal map to supply. The sites of battles are given with their dates; special points of view are indicated, though not so plentifully perhaps as could be wished; inns in remote parts and isolated spots are marked, and the various kinds of routes from high roads to glacier passes are, on the whole, clearly and distinctly discriminated. In addition to all this, the sites of the chief lake-dwellings are shown, and the nature of the antiquities found at each spot, in these and other cases, whether of the Stone, Iron, Bronze, or Roman period, is indicated with simple but clear marks of distinction. This is a feature peculiar, so far as we know, to this map, and one of great interest and importance. The map is so full of detail, and so accurate, that it is perhaps ungracious to find fault; but there are one or two insignificant omissions we have noticed which might perhaps be supplied in subsequent editions. We have already said that the points of view are rather meagrely indicated: we may, perhaps, add that they are somewhat arbitrarily selected: every one knows the Chaumont and the Rigi, but why should not the Schilthorn, the Lauberhorn, the Spärrenhorn, the Bella Tola, or the Dent de Jaman have the distinguishing star? Again, we find no indication of inns on the Abendberg near Interlaken, the Männlichen, or the Brienz Rothorn, though the latter is starred as a point of view. The editor of the map cannot be unaware that the pass of the Tête Noire has been used for charrs for the last two

years, but the char-road on the map ends still at Barberine to recommence at the Forclaz; again, the pass of the Schein or Schyn, between Thusis and Tiefenkasten, was certainly passable for charrs in 1868, and is, we believe, now a tolerably frequented road, though it remains a mule-pass in the map. The omission of the railway lately opened between Monza and Lecco is of less importance, as this occurs in the part of the map which is not yet finished. We are disposed to think that the general indication of mule-paths throughout the map, by a thin and almost imperceptible line, needs revision, as where the shading is at all dark the line is apt to coalesce with it. No one, for instance, on looking at the map would suspect the existence of an excellent mule-path from Barberine by Finshauts and Salvant to Vernavaz; it is a pity that some plan has not been devised for discriminating between well-made paths like this or the Gemmi, and mere variable tracks like the Zmeiden or the Col de Torrent. Of course, the purpose of an accurate map is not to give pleasure to those who know the country, but to give information to those who do not: on some of the paths we have mentioned a lady might ride with ease and safety, on others she would need considerable courage and endurance to do so, and such a distinction as this is certainly worthy of being noted. These, however, are after all but small blemishes in a noble work. England has at last produced a map of Switzerland not unworthy to be compared with the best efforts of the Swiss themselves, and the Alpine Club has furnished a triumphant answer to the ridicule and sneers so often levelled at a society which many ignorant persons, and some who ought to know better, are too apt to regard as a mere association of gymnasts.

A LONDON ALDERMAN'S JOURNAL, 1796-7.

(Concluded from page 237.)

"TUESDAY. 27 June. The papers give us to-day the progress of Parker's trial yesterday, which terminated in his conviction on all the charges and his sentence to be hanged, when & where the Admiralty may appoint, which, though the best row, is a very poor atonement to the country for his crimes. In the evening I walked several times round Finsbury Square, a place which now approaches nearly to the elegance of the squares in the west; I remember it a place for rubbish, and not a house built.

"Thursday 6 July. This day commences the new tax on newspapers, now advanced from 4½d. to 6d., so that in consequence I have given up the Morning Chronicle. It is now per annum 7l. 16s. 0d. to which add for the delivery here, making it 8l. 9s. 0d. The government will therefore lose by me 6l. 17s. 0d. instead of getting 1l. 19s. 0d., and I am persuaded that such will be the operation of the tax that the revenue will be lessened rather than increased by the impost.

"Saturday 8 July. Mr Pitt on Thursday brought a message from the King praying his faithful Commons to enable him to assist his faithful ally, the Queen of Portugal with a little cash which was of course granted, and £200,000 immediately appropriated as well as a farther sum of £300,000 for such other services as His Majesty may think proper. It is most extraordinary and one would really suppose it an experiment of the minister to try what the patience and the temper of the people could bear. The same argument exactly suited the purpose when we subsidized the King of Prussia, the Emperor of Germany, the King of Sardinia, and all the other carcass butchers of the continent. The King of Prussia has deserted our cause in a manner most disgraceful; the Emperor of Germany has done all that he could do, but he is in the hands of his enemy and compelled to sue for peace; the King of Sardinia has submitted to the victorious Frenchmen, who have silenced all the other lesser powers at least in terms of neutrality, overset the republics of Venice and Genoa, conquered Rome and are now giving law to the rest of Italy. And now forsooth because there is no other power to whom we can send our money, Mr Pitt has found out that it is proper and prudent to send £200,000 to the Queen of Portugal, and for what? If peace is to follow negotiation it is unnecessary surely to arm the Portuguese,

and if war is to continue of what avail is our money? When France after the mighty battles she has fought and the conquests she has made, is such a country as Portugal to stop her in the career of glory? Of what moment is the fleet of Lord St. Vincent, and all the ships and all the men and all the money, which the folly and stupidity of Mr Bull may send, in a contest between the kingdom of Portugal and the efforts united of France & Spain? It is not a drop of water in the ocean. She must fall and very likely without a battle; but Mr Bull is really beat blind and has lost all his senses together.

"Thursday 13 July. Charles Macklin, the veteran actor, died on Monday in his 98th year.

"Saturday 15 July. A few days ago died at his house in Beaconsfield the celebrated Edmund Burke, a man of very superior talents, and who for many years of his life maintained a character of incorruptible integrity, but his junction with Lord North after the American War, his unrelenting malicious persecution of Mr Hastings, and his acceptance of a pension from Mr Pitt, whose public conduct for many years he had reprobated in terms of the most bitter severity, mark him in my opinion as a corrupt unprincipled impostor, and from being the great defender of the rights of the people and the zealous supporter of the liberties of mankind has proved himself destitute of every honourable motive and as flagitious an advocate of the most profligate and wicked administration that ever existed in this country from the period of the Revolution. He was in his 68th year.

"Wednesday 19 July. A messenger from Lisle with the contre-projet of the French Directory, containing terms on which they are willing to shake hands with us, viz.: To restore all the conquests we have made from the French and their allies;—to restore all the ships we took from them at Toulon, and an indemnification for these we damaged & burnt &c. &c. Stocks fell 2 per cent, and people in general not quite so sanguine as they were in expectation of peace.

"I was much disappointed in my pursuit of a dinner, & at length—rather than go without—brought to and had a good beef-steak and a pot of porter and a salad at Mr Jay's in the Old Jewry, the oldest beef steak house in London, price 17s. From thence to my hospitable friend in the Borough, who gave me a bottle of excellent old port, and afterwards to Mr Nutt's where I eat my supper & chatted till the usual hour.

"Thursday 20 July. The king this day put an end to this Sessions of Parliament in rather a short speech, with thanks for their zeal, attention and service. House adjourned to the 5th Oct. I dined well at the banking house of Roberts & Co. Lombard Street, with Mr Charles Hornbyhold, Mr Ellis Wear, and Mr Berwick, with a Mr Buller, an eminent counsellor of Lincoln's Inn. We chatted pleasantly till the arrival of the Mail coaches, which terminated our repast. I think there were nine of them collected & very punctually proceeded on their respective journeys, viz. Elinbro', Glasgow, Wisbeach, Ipswich, Newmarket, and Dover, &c.

"Saturday, 22 July. Dined with Mr P. in the Borough, with whom in the evening I walked across the fields, and after parting bent my steps to the Hay Market Theatre, where I have not been for some years. The fourth act of the *Hair at Law* a new comedy written by Colman was on; it met with considerable applause and I think deservedly so. It was not such stuff as *The Cure for the Heart Ache* which attracted public notice so much the last season at Covent Garden, but possessed a portion of *vis Comica*, and though I could not understand the whole of the story, I can without scruple pronounce that it has merit and I should not think my time ill-spent to be present at another night's representation. *Lock and Key* was the afterpiece, in itself a compound of nonsense with two or three pretty songs, but there is no withstanding the incomparable talents of Fawcett and Munden. I drank a glass of punch on my return at a coffee house in Fleet Street and the clock struck twelve before I arrived in King Street.

"Monday 24 July. . . . On Friday died—aged 62 only—at his seat near Plastow, Peter Thelluson Esq., thought to be the most wealthy commoner in England. He was a merchant in London & obtained his money by his own industry and good fortune, besides expending a great deal, leaving behind him

upwards of £600,000, not obtained exactly by accumulated profits in trade, but by contracts, loans, stocks, &c.

"Tuesday 25 July. I dined well as I always do at Mr Nutt's on boiled mutton and roast veal; called in the evening at John's. The topic of general conversation was the will of Mr Thelluson, who has left a widow, three sons and three daughters. His sons have all of them lived fast and at a great expense, with the father's knowledge and approbation, who till the last hour of his life assured them of his affectionate regard, and of the satisfactory (to them) distribution of his property. He has left them £7500 apiece only, to his daughters £12000 each, to his widow the interest of £25000, three per cents. & of £6000 Long annuities, making together £2140 per annum. His vast estate in Yorkshire to be sold and with the residuum of his fortune real and personal to be vested in trust for the benefit of his first great grandson; but in case of failure he bequeaths all to the nation in aid of the National Debt. A more nefarious will never was made surely!

"Sunday 10 Sept. The Courier of last night brings accounts from Paris of the 5th and very important news. No less than the detection of another conspiracy to restore the monarchy of France and Louis 18 to the throne; and what is more extraordinary General Pichegru, the man who conquered Holland for the Republic, is at the head of the conspirators—arrested for the crime & committed to prison. Boissy d'Anglais, Camille Jourdan, & the names of many others are mentioned to have been likewise arrested—in the whole 64 of the Legislative Body. The barriers of Paris are shut, a Committee of five is formed to examine into the state of the nation. The Directory and the other councils have adjourned to other places for their debates & their sittings declared permanent. What influence this new commotion will have on the negotiations at Udina and Lisle is a very natural question but difficult to decide.

"Wednesday, 20 Sept. A second edition of the Courier announces that the negotiation at Lisle is abruptly broken off, that Lord Malmesbury was ordered to quit France in 48 hours and in consequence was on Monday evening actually in Calais, & his carriage embarked on board the Diana packet. Many affect to believe that this news is untrue, but it appears too correctly stated to be doubted by a man of common sense—the natural effect of a cause, whether true or false, which the Directory of France have endeavoured to impose on the minds of the people, namely, that English money and English intrigue has been at the bottom of the late conspiracy. Under such suspicion, real or pretended it is likely that the Frenchmen should believe in the sincerity of English government at the moment it is discovered that we have been endeavouring again to introduce another system of anarchy and blood, to subvert the existing government of Republican principles, and restore Louis 18 to the throne of his ancestors. That that was the disposition, and is the present disposition of this country and the absolute cause of the war, no man on earth, who has both eyes to see and ears to hear, can possibly doubt; and the idea never will be abandoned but from necessity—and that it must be abandoned (as far as appearances go) is as clear as the sun, for of the destruction of the Republic by force even Mr Bull is not mad enough to dream now.

"Thursday, 21 Sept. The return of Lord Malmesbury is true. He crossed the water on Tuesday & yesterday arrived in London. The fall of the stocks on Saturday was certainly a prelude as well as a proof that somebody was in the secret & profited by what he knew—3 per cents. now 47 and the Loyalty Loan at 17½ discount. What was the point which terminated the negotiation we know not at present.

"Friday, 14 Oct. to 18 December inclusive.

" . . . Without any particular cause I have been too negligent of my Journal, yet many events of great importance have taken place. The signal victory of Admiral Duncan over the Dutch off the coast of Holland comes the nearest to our feelings. It was fought on the 11 October, and the Admiral created a viscount. . . . Frederick the 2d King of Prussia died on the 16 Novr, and whether we consider his character as a Man or a Monarch, perhaps he has not left a greater Rascal on earth. . . . Mr Pitt's friends now publicly condemn his conduct, and many of them will find out to be true, I dare say, what I have in many places

predicted, that he has got us into the scrape, but has neither honor, honesty or ability to get us out.

"Tuesday 19 Dec. The day appointed by the King for the important victories gained over the French by Lord Howe on the 1 June 1794—over the Spaniards on the 14 Feb. and over the Dutch by Lord Duncan on the 11th Oct. in the present year. His Majesty &c. went to St Pauls in procession. The spectacle was grand and the weather favoured the event.

"Bedford, Friday 25th of May 1798. Why I should have discontinued this journal till this date from the commencement of the year I know not, and still more extraordinary that I should have been so negligent when I have had much leisure time to have recorded the important events which have occurred—and writing I have ever found an amusement rather than a labour. The continuation of a diary of this sort by many may be thought dull and uninteresting, but as I write for my own pleasure and not for the satisfaction of other people, I do not see the reason why I should not ride my own hobby in my own way. Thus I proceed—We left 42, Old Broad St on the 10th of January before three in the afternoon, after having been kindly and very hospitably entertained from the 11th October. At the bottom of Barnet Hill nearly opposite the tenth milestone we were stopped and robbed by three foot-pads craped. One held the horses and one came to the door on each side the chaise. Little dreaming of such an attack while it was yet day, I was taken very much unprepared for the visit, and lost a good deal more property than I ought to have had unguarded. They robbed me of about £46 in bank notes & money, & took with them Mr M's dressing box, which with the trinkets could not be replaced for less than £50. It is a very awkward situation for a man to be in—to be placed in a confined situation with pistols at your breast, in the trembling hands of such rascals. Mrs. M. was a good deal alarmed when the danger was over but behaved very well at the moment."

In spite of the sentiments expressed in this last entry, the diary does not seem to have been ever resumed. Such few facts as we have been able to gather establishing the identity of the writer may be added in conclusion. The manuscript from which these extracts have been taken is described as the Journal of "G. M. Macaulay;" and it is evident from numerous entries in it, not considered of sufficient general import to quote, that the writer's proper home was at Bedford; indeed, fully one-half the diary relates to friends and pursuits in that town and is consequently of great local interest. To the above information enquiry and research have been able to add nothing beyond the following obituary notice in the *Gentleman's Magazine* for 1803:—

"March 5. At Bedford, of a quinsy, George Mackenzie Macaulay, esq. alderman of Coleman Street ward, to which he was elected in 1786; and in 1790 served the office of sheriff. He was an active and intelligent magistrate; and possessed very strong natural abilities, highly improved by a cultivated education. He had been twice married; and has left a very numerous family by each of his wives. To his widow the Corporation of London have, in a very handsome manner, unanimously voted an annuity of 100l."

CORRESPONDENCE.

THE PHOENICIANS IN BRAZIL.

Strasbourg: Aug. 20, 1874.

In No. 110 of this journal (June 13, 1874), I took occasion to express my conviction—founded on philological grounds—that the Inscription contained in the *Novo Mundo* of April 23, 1874, and given as the fac-simile of the Phoenician original, was a forgery. Since then Professor Schlottmann, in the *Jenaer Literatur Zeitung*, July 25, 1874, has, independently—but on the same grounds as those which I assumed—given expression to his doubts of its genuineness. In the meanwhile, however, Professor Jacob Prag had undertaken, in Nos. 115 and 119 of the *ACADEMY*, to defend the character of the inscription, and at the same time to correct the errors which he assumes me to have made in my objections. In regard to the latter point, however, Professor Prag has allowed himself to argue on entirely false premises, since he proposes to instruct me as to *Hebrew* forms, while the matter under discussion refers solely to *Phoenician*. There can hardly be a doubt but that the author of that inscription intended to give us a Phoenician text, instead of which, however, he has presented us with a mixture of Hebrew and Chaldaic. It is not, therefore, very pertinent or logical to meet my statements as to how certain things should be expressed in Phoenician—statements made on the authority of genuine Phoenician texts—by the assertion, that in Hebrew they would be different.

I am bound to confess that I erred in accusing the compiler of the inscription of having confounded the first and third persons of the verb; but in regard to other points, I scarcely expressed myself sufficiently strongly, and I would therefore subjoin the following notes to my former objections:—

In the first place, it is quite obvious from the *עלינום ועלינו*, at lines 2, 3, 8, that the author had not reached our present stand-point of Phoenician scholarship. Gesenius in his *Monumenta* (p. 357-368) may not unreasonably have assumed that these were the Phoenician equivalents for the Plautinian ALONIM VALONUTH (in the Latin Parallel text: "Dii, Deaque"), but since the discovery at Sidon, on January 19, 1855, of the sarcophagus of the King Eshmunazar, it would be hopeless to expect that such an hypothesis could be any longer applied with impunity in the fabrication of a Phoenician inscription; for on that king's monument stood in full and unabbreviated letters אלנים alonim = Gods, while there was no trace of עליונים *elyonim*, with *scriptio plena* in the bargain.

It was undoubtedly an evidence of the great caution of the compiler that he did not give the irregularly-formed plural of the Hebrew אֱלֹהִים, viz., אֱלֹהִים; but then, on the other hand, it was clearly superfluous to substitute for it the poetical

Hebrew אֱלֹהִים. He might have taken the genuine Phoenician plural of אֱלֹהִים, viz., אֱלֹהִים, which occurs twice, and to this I wished to draw attention by my short quotation "see Carthag., No. 195."

Professor Prag seems to be wholly unaware of the large number of Carthaginian inscriptions extant. From my own knowledge I am able to indicate 237 which have already been printed, and 120 which will speedily be made public. Of these, without counting those scattered about in pamphlets, 9 occur in Gesenius, *Monumenta*, 90 in the Carthaginian Inscriptions of the British Museum, 59 in Maltzan's *Reise in der Regentschaft Tunis und Tripolis*, tom. 1; and about 50 in my *Punische Steine*, in the *Mémoires de l'Académie Impér. des Sciences de St. Pétersbourg* (vii. sér. tome xvii., no. 3). The last-named work contains Carthag. no. 195, in which occurs the following passage:

עשרת האשים אל המקדש "Decemviri qui templis praepositi."

The plural of אֱלֹהִים appears again in not yet edited inscription which I propose shortly to publish as אֱלֹהִים (in the year . . . after the era) of the people of Kitium.

The irregularity in the construction of the numerals in Genesis, chap. vii. v. 13, which, moreover, is explained by בניני which follows it, is so unique in its character, that Professor Prag would probably be the first to condemn its use as an awkward and inelegant form in any Hebrew composition. For the present, at all events, I feel I may safely characterise such licences as sins against genuine Phoenician, and that with the same right with which we claim *schisma* as a neuter, although the Emperor Sigismund used it at the Council of Constance with "obstinate ignorance" in the feminine gender.

A genuine native of Sidon would probably have written וְשֵׁשׁ עָשָׂר (or עָשָׂר) instead of שֵׁשׁ עָשָׂר. At line 5 the use of נָדָה as a verb for the Phoenician נָח demands some justification, particularly as a לָהּ verb, which is not known in Phoenician, where its only representative is לָהּ.

DR. JULIUS EUTING.

POSTHUMUS IN "CYMBELINE"—A CORRECTION.

3 St. George's Square, N.W.: Sept. 2, 1874.

In the current number of *Macmillan's Magazine*, p. 415, col. 1, is a curious instance of Mr. Fleay's "incautious" statements. He says that among the "striking peculiarities" of act iv. sc. 2 of *Cymbeline*, one "is almost decisive in itself for a separate date" for this scene, namely, that "in this scene in *Cymbeline*, Posthumus (proparoxyton) is the pronunciation adopted:—

"'Struck the maintop. O Posthumus! Alas!'

In every other scene it is Posthúmus (paroxyton)." On turning to the play to verify these two statements, I found (1) that only twelve lines before the line quoted by Mr. Fleay, the name was pronounced Posthúmus, and so accented by Dyce.

A headless man! The garments of | Posthúmus (to make it "Pósthumus" would turn the line to prose). Compare I. i., "That lock | up your | restraint |— For you | Posthúmus"—and V. v., "By being worse | than they. | I am | Posthúmus." Also (2) in act iii. sc. 4, "Posthumus" occurred again: "The residence | of Posthumus"—so nigh | at least | a line of six measures; though, if you want to make it fit a theory, you can, by squeezing out the i of "residence," and making -mus an extra syllable before the pause, turn the line into a five-measure one, and put the stress on u, Posthúmus. At any rate, one of Mr. Fleay's statements is wrong, if not both; and his "almost decisive" test for a separate date for this scene of *Cymbeline* altogether fails; the keystone of his criticism of the play falls in.

F. J. FURNIVALL.

SCIENCE.

MEETING OF THE BRITISH ASSOCIATION
AT BELFAST.

ADDRESS TO THE DEPARTMENT OF ZOOLOGY AND
BOTANY, BY DR. HOOKER, C.B., D.C.L., PRES.
ROYAL SOCIETY.

(Continued from page 247.)

THE superficial teleology of the last century was easily satisfied, without looking far for explanations, but it is just worth while pausing for a moment to observe that, although Linnaeus had no materials for making any real investigation as to the purpose of the pitchers of *Sarracenia*, he very sagaciously anticipated the modern views as to their affinities. They are now regarded as very near allies of water-lilies—precisely the position which Linnaeus assigned to them in his fragmentary attempt at a true natural classification. And besides this, he also suggested the analogy which, improbable as it may seem at first sight, has been worked out in detail by Baillon (in apparent ignorance of Linnaeus' writings) between the leaves of *Sarracenia* and water-lilies.

Linnaeus seems to have supposed that *Sarracenia* was originally aquatic in its habits, that it had Nymphaea-like leaves, and that when it took to a terrestrial life its leaves became hollowed out, to contain the water in which they could no longer float—in fact, he showed himself to be an evolutionist of the true Darwinian type.

Catesby's suggestion was a very infelicitous one. The insects which visit these plants may find in them a retreat, but it is one from which they never return. Linnaeus's correspondent Collinson remarked in one of his letters, that "many poor insects lose their lives by being drowned in these cisterns of water;" but William Bartram, the son of the botanist, seems to have been the first to have put on record at the end of the last century, the fact that *Sarracenia* catch insects and put them to death, in the wholesale way that they do.

Before stopping to consider how this is actually achieved, I will carry the history a little further.

In the two species in which the mouth is unprotected by the lid it could not be doubted that a part, at any rate, of the contained fluid, was supplied by rain. But in *Sarracenia variolaris*, in which the lid closes over the mouth, so that rain cannot readily enter it, there is no doubt that a fluid is secreted at the bottom of the pitchers, which probably has a digestive function. William Bartram, in the preface to his travels in 1791, described this fluid, but he was mistaken in supposing that it acted as a lure. There is a sugary secretion which attracts insects, but this is only found at the upper part of the tube. Bartram must be credited with the suggestion, which he, however, only put forward doubtfully, that the insects were dissolved in the fluid, and then became available for the alimentation of the plants.

Sir J. E. Smith, who published a figure and description of *Sarracenia variolaris* noticed that it secreted fluid, but was content to suppose that it was merely the gaseous products of the decomposition of insects that subserved the processes of vegetation. In 1829, however, thirty years after Bartram's book, Burnett wrote a paper containing a good many original ideas expressed in a somewhat quaint fashion, in which he very strongly insisted on the existence of a true digestive process in the case of *Sarracenia*, analogous to that which takes place in the stomach of an animal.

Our knowledge of the habits of *Sarracenia variolaris* is now pretty complete, owing to the observations of two South Carolina physicians. One, Dr. McBride, made his observations half a century ago, but they had, till quite recently, completely fallen into oblivion. He devoted himself to the task of ascertaining why it was that *Sarracenia variolaris* was visited by flies, and how it was that it captured them. This is what he ascertained:—

"The cause which attracts flies is evidently a viscid substance, resembling honey, secreted by or exuding from the internal surface of the tube. From the margin, where it commences, it does not extend lower than one-fourth of an inch. The falling of the insect as soon as it enters the tube, is wholly attributable to the downward or inverted position of the hairs of the internal surface of the leaf. At the bottom of a tube split open, the hairs are plainly discernible, pointing downwards; as the eye ranges upward they gradually become shorter and attenuated, till at or just below the surface covered by the bait they are no longer perceptible to the naked eye, nor to the most delicate touch. It is here that the fly cannot take a hold sufficiently strong to support itself, but falls."

Dr. Mellichamp, who is now resident in the district in which Dr. McBride made his observations, has added a good many particulars to our knowledge. He first investigated the fluid which is secreted at the bottom of the tubes. He satisfied himself that it was really secreted, and describes it as mucilaginous, but leaving in the mouth a peculiar astringency. He compared the action of this fluid with that of distilled water on pieces of fresh venison, and found that after fifteen hours the fluid had produced most change, and also most smell; he therefore concluded that as the leaves when stuffed with insects become most disgusting in odour, we have to do, not with a true digestion, but with an accelerated decomposition. Although he did not attribute any true digestive power to the fluid secreted by the pitchers, he found that it had a remarkable anaesthetic effect upon flies immersed in it. He remarked that "a fly when thrown into water is very apt to escape, as the fluid seems to run from its wings," but it never escaped from the *Sarracenia* secretion. About half a minute after being thrown in, the fly became to all appearance dead, though if removed, it gradually recovered in from half an hour to an hour.

According to Dr. Mellichamp, the sugary lure discovered by Dr. McBride, at the mouth of the pitchers, is not found on either the young ones of one season, or the older ones of the previous year. He found, however, that about May it could be detected without difficulty, and more wonderful still, that there is a honey-baited pathway leading directly from the ground to the mouth, along the broad wing of the pitcher, up which insects are led to their destruction.

From these narratives it is evident that there are two very different types of pitcher in *Sarracenia*, and an examination of the species shows that there must probably be three. These may be primarily classified into those with the mouth open and lid erect, and which consequently receive the rain water in more or less abundance; and those with the mouth closed by the lid, into which rain can hardly, if at all, find ingress.

To the first of these belongs the well-known *S. purpurea*, with inclined pitchers, and a lid so disposed as to direct all the rain that falls upon it also into the pitcher; also *S. flava*, *rubra*, and *Drummondii*, all with erect pitchers and vertical lids. Of these three the lid in a young state arches over the mouth, and in an old state stands nearly erect, and has the sides so reflected that the rain which falls on its upper surface is guided down the outside of the back of the pitcher, as if to prevent the flooding of the latter.

To the second group belong *S. psittacina* and *S. variolaris*.

The tissues of the internal surfaces of the pitchers are singularly beautiful. They have been described in one species only, the *S. purpurea*, by August Vogt; but from this all the other species which I have examined differ materially. Beginning from the upper part of the pitcher, there are four surfaces, characterised by different tissues, which I shall name and define as follow:—

1. An attractive surface, occupying the inner

surface of the lid, which is covered with an epidermis, stomata, and (in common with the mouth of the pitcher) with minute honey-secreting glands; it is further often more highly coloured than any other part of the pitcher, in order to attract insects to the honey.

2. A conducting surface, which is opaque, formed of glassy cells, which are produced into deflexed, short, conical spinous processes. These processes, overlapping like the tiles of a house, form a surface down which an insect slips, and afford no foothold to an insect attempting to crawl up again.

3. A glandular surface (seen in *S. purpurea*), which occupies a considerable portion of the cavity of the pitcher below the conducting surface. It is formed of a layer of epidermis, with sinuous cells, and is studded with glands; and being smooth and polished, this too affords no foothold for escaping insects.

4. A detentive surface, which occupies the lower part of the pitcher, in some cases for nearly its whole length. It possesses no cuticle, and is studded with deflexed stars, rigid, glass-like, needle-formed, striated hairs, which further converge towards the axis of the diminishing cavity; so that an insect, if once amongst them, is effectually detained, and its struggles have no other result than to wedge it lower and more firmly in the pitcher.

Now, it is a very curious thing, that in *S. purpurea*, which has an open pitcher, so formed as to receive and retain a maximum of rain, no honey secretion has hitherto been found, nor has any water been seen to be secreted in the pitcher; it is further the only species in which (as stated above) I have found a special glandular surface, and in which no glands occur on the detentive surface. This concurrence of circumstances suggests the possibility of this plant either having no proper secretion of its own, or only giving it off after the pitcher has been filled with rain water.

In *S. flava*, which has open-mouthed pitchers and no special glandular surface, I find glands in the upper portion of the detentive surface, amongst the hairs, but not in the middle or lower part of the same surface. It is proved that *S. flava* secretes fluid, but under what precise conditions I am not aware. I have found none but what may have been accidentally introduced in the few cultivated specimens which I have examined, either in the full-grown state or in the half-grown, when the lid arches over the pitcher. I find the honey in these as described by the American observers, and honey-secreting glands on the edge of the wing of the pitcher, together with similar glands on the outer surface of the pitcher, as seen by Vogt in *S. purpurea*.

Of the pitchers with closed mouths, I have examined those of *S. variolaris* only, whose tissues closely resemble those of *S. flava*. That it secretes a fluid noxious to insects there is no doubt, though in the specimens I examined I found none.

There is obviously thus much still to be learned with regard to *Sarracenia*, and I hope that American botanists will apply themselves to this task. It is not probable that three pitchers so differently constructed as those of *S. flava*, *purpurea*, and *variolaris*, and presenting such differences in their tissues, should act similarly. The fact that insects normally decompose in the fluid of all, would suggest the probability that they all feed on the products of decomposition; but as yet we are absolutely ignorant whether the glands within the pitchers are secretive or absorptive, or both; if secretive, whether they secrete water or a solvent; and if absorptive, whether they absorb animal matter or the products of decomposition.

It is quite likely, that just as the saccharine exudation only makes its appearance during one particular period in the life of the pitcher, so the digestive functions may also be only of short duration. We should be prepared for this from the case of the *Dionaea*, the leaves of which cease

after a time to be fit for absorption, and become less sensitive. It is quite certain that the insects which go on accumulating in the pitchers of *Sarracenia* must be far in excess of its needs for any legitimate process of digestion. They decompose; and various insects, too wary to be entrapped themselves, seem habitually to drop their eggs into the open mouth of the pitchers, to take advantage of the accumulation of food. The old pitchers are consequently found to contain living larvae and maggots, a sufficient proof that the original properties of the fluid which they secrete must have become exhausted; and Barton tells us that various insectivorous birds slit open the pitchers with their beaks to get at the contents. This was probably the origin of Linnaeus' statement that the pitchers supplied birds with water.

The pitchers finally decay, and part, at any rate, of their contents must supply some nutriment to the plant by fertilising the ground in which it grows.

Darlingtonia.—I cannot take leave of *Sarracenia* without a short notice of its near ally, *Darlingtonia*, a still more wonderful plant, an outlier of *Sarracenia* in geographical distribution, being found at an elevation of 5,000 feet on the Sierra Nevada of California, far west of any locality inhabited by *Sarracenia*. It has pitchers of two forms; one, peculiar to the infant state of the plant, consists of narrow, somewhat twisted, trumpet-shaped tubes, with very oblique open mouths, the dorsal lip of which is drawn out into a long, slender, arching, scarlet hood, that hardly closes the mouth. The slight twist in the tube causes these mouths to point in various directions, and they entrap very small insects only. Before arriving at a state of maturity the plant bears much larger, suberect pitchers, also twisted, with the lip produced into a large inflated hood, that completely arches over a very small entrance to the cavity of the pitcher. A singular orange-red flabby two-lobed organ hangs from the end of the hood, right in front of the entrance, which, as I was informed last week by letter from Professor Asa Gray, is smeared with honey on its inner surface. These pitchers are crammed with large insects, especially moths, which decompose in them, and result in a putrid mass. I have no information of water being found in its pitchers in its native country, but have myself found a slight acid secretion in the young states of both forms of pitcher.

The tissues of the inner surfaces of the pitchers of both the young and old plant I find to be very similar to those of *Sarracenia variolaris* and *flava*.

Looking at a flowering specimen of *Darlingtonia*, I was struck with a remarkable analogy between the arrangement and colouring of the parts of the leaf and of the flower. The petals are of the same colour as the flap of the pitcher, and between each pair of petals is a hole (formed by a notch in the opposed margins of each) leading to the stamens and stigma. Turning to the pitcher, the relation of its flap to its entrance is somewhat similar. Now, we know that coloured petals are specially attractive organs, and that the object of their colour is to bring insects to feed on the pollen or nectar, and in this case by means of the hole to fertilise the flower; and that the object of the flap and its sugar is also to attract insects, but with a very different result, cannot be doubted. It is hence conceivable that this marvellous plant lures insects to its flowers for one object, and feeds them while it uses them to fertilise itself, and that, this accomplished, some of its benefactors are thereafter lured to its pitchers for the sake of feeding itself!

But to return from mere conjecture to scientific earnest, I cannot dismiss *Darlingtonia* without pointing out to you what appears to me a most curious point in its history; which is, that the change from the slender, tubular, open-mouthed, to the inflated close-mouthed pitchers, is, in all the specimens which I have examined, absolutely

sudden in the individual plant. I find no pitchers in an intermediate stage of development. This, a matter of no little significance in itself, derives additional interest from the fact, that the young pitchers to a certain degree represent those of the *Sarracenia*s with open mouths and erect lids; and the old pitchers those of the *Sarracenia*s with closed mouths and globose lids. The combination of representative characters in an outlying species of a small order, cannot but be regarded as a marvellously significant fact in the view of those morphologists who hold the doctrine of evolution.

Nepenthes.—The genus *Nepenthes* consists of upwards of thirty species of climbing half-shrubby plants, natives of the hotter parts of the Asiatic Archipelago from Borneo to Ceylon, with a few outlying species in New Caledonia, in tropical Australia, and in the Seychelle Islands on the African coast. Its pitchers are abundantly produced, especially during the younger state of the plants. They present very considerable modifications of form and external structure, and vary greatly in size, from little more than an inch to almost a foot in length; one species, indeed, which I have here from the mountains of Borneo, has pitchers which, including the lid, measure a foot and a half, and its capacious bowl is large enough to drown a small animal or bird.

The structure of the pitcher of *Nepenthes* is less complicated on the whole than that of *Sarracenia*, though some of its tissues are much more highly specialised. The pitcher itself is here not a transformed leaf, as in *Sarracenia*, nor is it a transformed leaf-blade, like that of *Dionaea*, but an appendage of the leaf developed at its tip, and answers to a water-secreting gland that may be seen terminating the mid-rib of the leaf of certain plants. It is furnished with a stalk, often a very long one, which in the case of pitchers formed on leaves high up the stem has (before the full development of the pitcher) the power of twisting like a tendril round neighbouring objects, and thus aiding the plant in climbing, often to a great height in the forest.

In most species the pitchers are of two forms, one appertaining to the young, the other to the old state of the plant, the transition from one form to the other being gradual. Those of the young state are shorter and more inflated; they have broad fringed longitudinal wings on the outside, which are probably guides to lead insects to the mouth; the lid is smaller and more open, and the whole interior surface is covered with secreting glands. Being formed near the root of the plant, these pitchers often rest on the ground, and in species which do not form leaves near the root, they are sometimes suspended from stalks which may be fully a yard long, and which bring them to the ground. In the older state of the plant the pitchers are usually much longer, narrower, and less inflated, and are trumpet-shaped, or even conical; the wings also are narrower, less fringed, or almost absent. The lid is larger and slants over the mouth, and only the lower part of the pitcher is covered with secreting glands, the upper part presenting a tissue analogous to the conducting tissue of *Sarracenia*, but very different anatomically. The difference in structure of these two forms of pitcher, if considered in reference to their different positions on the plant, forces the conclusion on the mind, that the one form is intended for ground game, the other for winged game. In all cases the mouth of the pitcher is furnished with a thickened corrugated rim, which serves three purposes: it strengthens the mouth and keeps it distended; it secretes honey (at least in all the species I have examined under cultivation, for I do not find that any other observer has noticed the secretion of honey by *Nepenthes*) and it is in various species developed into a funnel-shaped tube that descends into the pitcher, and prevents the escape of insects, or into a row of incurved hooks, that are in some cases strong enough to retain a small bird, should it, when in search of water or

insects, thrust its body beyond a certain length into the pitcher.

In the interior of the pitcher of *Nepenthes* there are three principal surfaces: an *attractive*, *conductive*, and a *secretive* surface; the *detentive* surface of *Sarracenia* being represented by the fluid secretion, which is here invariably present at all stages of growth of the pitcher.

The attractive surfaces of *Nepenthes* are two, those, namely, of the rim of the pitcher, and of the under surface of the lid, which is provided in almost every species with honey-secreting glands, often in great abundance. These glands consist of spherical masses of cells, each embedded in a cavity of the tissue of the lid, and encircled by a guard-ring of glass-like cellular tissue. As in *Sarracenia*, the lid and mouth of the pitcher are more highly coloured than any other part, with the view of attracting insects to their honey. It is a singular fact that the only species known to me that wants these honey glands on the lid is the *N. ampullaria*, whose lid, unlike that of the other species, is thrown back horizontally. The secretion of honey on a lid so placed would tend to lure insects away from the pitcher instead of into it.

From the mouth to a variable distance down the pitcher is an opaque glaucous surface, precisely resembling in colour and appearance the conductive surface of the *Sarracenia*, and like it affording no foot-hold to insects, but otherwise wholly different; it is formed of a fine network of cells, covered with a glass-like cuticle, and studded with minute reniform transverse excrescences.

The rest of the pitcher is entirely occupied with the secretive surface, which consists of a cellular floor crowded with spherical glands in inconceivable numbers. Each gland precisely resembles a honey-gland of the lid, and is contained in a pocket of the same nature, but semicircular, with the mouth downwards, so that the secretive fluid all falls to the bottom of the pitcher. In the *Nepenthes Rafflesiana* three thousand of the glands occur on a square inch of the inner surface of the pitcher, and upwards of a million in an ordinary sized pitcher. I have ascertained that, as was indeed to be expected, they secrete the fluid which is contained in the bottom of the pitcher before this opens, and that the fluid is always acid.

The fluid, though invariably present, occupies a comparatively small portion of the glandular surface of the pitcher, and is collected before the lid opens. When the fluid is emptied out of a fully formed pitcher that has not received animal matter, it forms again, but in comparatively very small quantities; and the formation goes on for many days, and to some extent even after the pitcher has been removed from the plant. I do not find that placing inorganic substances in the fluid causes an increased secretion, but I have twice observed a considerable increase of fluid in pitchers after putting animal matter in the fluid.

To test the digestive powers of *Nepenthes*, I have closely followed Mr. Darwin's treatment of *Dionaea* and *Drosera*, employing white of egg, raw meat, fibrine and cartilage. In all cases the action is most evident, in some surprising. After twenty-four hours' immersion the edges of the cubes of white of egg are eaten away and the surfaces gelatinised. Fragments of meat are rapidly reduced; and pieces of fibrine weighing several grains dissolve and totally disappear in two or three days. With cartilage the action is most remarkable of all; lumps of this weighing eight and ten grains are half gelatinised in twenty-four hours, and in three days the whole mass is greatly diminished, and reduced to a clear transparent jelly. After drying some cartilage in the open air for a week, and placing it in an unopened but fully-formed pitcher of *N. Rafflesiana*, it was acted upon similarly and very little more slowly.

That this process, which is comparable to digestion, is not wholly due to the fluid first secreted by the glands, appears to me most probable; for I

find that very little action takes place in any of the substances placed in the fluid drawn from pitchers, and put in glass tubes; nor has any followed after six days' immersion of cartilage or fibrine in pitchers of *N. ampullaria* placed in a cold room, whilst on transferring the cartilage from the pitcher of *N. ampullaria* in the cold room to one of *Rafflesiana* in the stove, it was immediately acted upon. Comparing the action of fibrine, meat, and cartilage placed in tubes of *Nepenthes* fluid, with other in tubes of distilled water, I observed that their disintegration is three times more rapid in the fluid; but this disintegration is wholly different from that effected by immersion in the fluid of the pitcher of a living plant.

In the case of small portions of meat, $\frac{1}{4}$ —2 grains, all seems to be absorbed; but with 8—10 grains of cartilage it is not so, a certain portion disappears, the rest remains as a transparent jelly, and finally becomes putrid, but not till after many days. Insects appear to be acted upon somewhat differently, for after several days' immersion of a large piece of cartilage, I found that a good sized cockroach which had followed the cartilage and was drowned for his temerity, in two days became putrid. On removing the cockroach the cartilage remained inodorous for many days. In this case no doubt the antiseptic fluid had permeated the tissue of the cartilage, whilst enough did not remain to penetrate the chitinous hard covering of the insect, which consequently decomposed.

In the case of cartilage placed in fluid taken from the pitcher, it becomes putrid, but not so soon as if placed in distilled water.

From the above observations it would appear probable that a substance acting as pepsine is given off from the inner wall of the pitcher, but chiefly after placing animal matter in the acid fluid; but whether this active agent flows from the glands, or from the cellular tissue in which they are embedded, I have no evidence to show.

I have here not alluded to the action of these animal matters in the cells of the glands, which is, as has been observed by Mr. Darwin, in *Drosera*, to bring about remarkable changes in their protoplasm, ending in their discolouration. Not only is there aggregation of the protoplasm in the gland-cells, but the walls of the cells themselves become discoloured, and the glandular surface of the pitcher that at first was of a uniform green, becomes covered with innumerable brown specks (which are the discoloured glands). After the function of the glands is exhausted, the fluid evaporates, and the pitcher slowly withers.

At this stage I am obliged to leave this interesting investigation. That *Nepenthes* possesses a true digestive process such as has been proved in the case of *Drosera*, *Dionaea*, and *Pinguicula*, cannot be doubted. This process, however, takes place in a fluid which deprives us of the power of following it further by direct observation. We cannot here witness the pouring out of the digestive fluid, we must assume its presence and nature from the behaviour of the animal matter placed in the fluid in the pitcher. From certain characters of the cellular tissues of the interior walls of the pitcher, I am disposed to think that it takes little part in the processes of either digestion or assimilation, and that these, as well as the pouring out of the acid fluid, are all functions of the glands.

In what I have said, I have described the most striking instances of plants which seem to invert the order of Nature, and to draw their nutriment—in part at least—from the animal kingdom, which it is often held to be the function of the vegetable kingdom to sustain.

I might have added some additional cases to those I have already dwelt upon. Probably, too, there are others still unknown to science, or whose habits have not yet been detected. Delpino, for example, has suggested that a plant, first described by myself in the Botany of the Antarctic voyage, *Caltha dionaeifolia*, is so analogous in the structure of its leaves to *Dionaea*, that it is difficult to

resist the conviction that its structure also is adapted for the capture of small insects.

But the problem that forces itself upon our attention is, How does it come to pass that these singular aberrations from the otherwise uniform order of vegetable nutrition, make their appearance in remote parts of the vegetable kingdom—why are they not more frequent, and how were such extraordinary habits brought about or contracted? At first sight the perplexity is not diminished by considering—as we may do for a moment—the nature of ordinary vegetable nutrition. Vegetation, as we see it everywhere, is distinguished by its green colour, which we know depends on a peculiar substance called chlorophyll: a substance which has the singular property of attracting to itself the carbonic acid gas which is present in minute quantities in the atmosphere, of partly decomposing it, so far as to set free a portion of its oxygen, and of recombining it with the elements of water to form those substances, such as starch, cellulose, and sugar, out of which the framework of the plant is constructed.

But, beside these processes, the roots take up certain matters from the soil. Nitrogen forms nearly four-fifths of the air we breathe, yet plants can possess themselves of none of it in the free uncombined state. They withdraw nitrates and salts of ammonia in minute quantities from the ground, and from these they build up with starch, or some analogous material, albuminoids or protein compounds, necessary for the sustentation and growth of protoplasm.

At first sight nothing can be more unlike this than a *Dionaea* or a *Nepenthes* capturing insects, pouring out a digestive fluid upon them, and absorbing the albuminoids of the animal, in a form probably directly capable of appropriation for their own nutrition. Yet there is something not altogether wanting in analogy in the case of the most regularly constituted plants. The seed of the castor-oil plant contains, besides the embryo seedling, a mass of cellular tissue or endosperm filled with highly nutritive substances. The seedling lies between masses of this, and is in contact with it—and as the warmth and moisture of germination set up changes which bring about the liquefaction of the contents of the endosperm and the embryo absorbs them, it grows in so doing, and at last having taken up all it can from the exhausted endosperm, develops chlorophyll in its cotyledons under the influence of light, and relies on its own resources.

A large number of plants, then, in their young condition, borrow their nutritive compounds ready prepared, and this is in effect what carnivorous plants do later in life.

That this is not merely a fanciful way of regarding the relation of the embryo to the endosperm, is proved by the ingenious experiments of Van Tieghem, who has succeeded in substituting for the real, an artificial endosperm, consisting of appropriate nutritive matters. Except that the embryo has its food given to it in a manner which needs no digestion—a proper concession to its infantine state—the analogy here with the mature plants which feed on organic food seems to be complete.

But we are beginning also to recognise the fact that there are a large number of flowering-plants that pass through their lives without ever doing a stroke of the work that green plants do. These have been called Saprophytes. *Monotropa*, the curious bird's-nest orchis (*Neottia Nidus-avis*), *Epipogium*, and *Corallorhiza* are instances of British plants which nourish themselves by absorbing the partially decomposed materials of other plants, in the shady or marshy places which they inhabit. They reconstitute these products of organic decomposition, and build them up once more into an organism. It is curious to notice, however, that the tissues of *Neottia* still contain chlorophyll in a nascent though useless state, and that if a plant of it be immersed in boiling water, the characteristic green colour reveals itself.

Epipogium and *Corallorhiza* have lost their proper absorbent organs; they are destitute of roots, and take in their food by the surfaces of their underground stem structures.

The absolute difference between plants which absorb and nourish themselves by the products of the decomposition of plant-structures, and those which make a similar use of animal structures is not very great. We may imagine that plants accidentally permitted the accumulation of insects in some parts of their structure, and the practice became developed because it was found to be useful. It was long ago suggested that the receptacle formed by the connate leaves of *Dipsacus* might be an incipient organ of this kind; and though no insectivorous habit has ever been brought home to that plant, the theory is not improbable.

Linnaeus, and more lately Baillon, have shown how a pitcher of *Sarracenia* may be regarded as a modification of a leaf of the *Nymphaea* type. We may imagine such a leaf first becoming hollow, and allowing debris of different kinds to accumulate; these would decompose, and a solution would be produced, some of the constituents of which would diffuse themselves into the subjacent plant tissues. This is in point of fact absorption, and we may suppose that in the first instance—as perhaps still in *Sarracenia purpurea*—the matter absorbed was merely the saline nutritive products of decomposition, such as ammoniacal salts. The act of digestion—that process by which soluble food is reduced without decomposition to a soluble form fitted for absorption—was doubtless subsequently required.

The secretion, however, of fluids by plants is not an unusual phenomenon. In many Aroids a small gland at the apex of the leaves secretes fluid, often in considerable quantities, and the pitcher of *Nepenthes* is, as I have shown elsewhere, only a gland of this kind enormously developed. May not, therefore, the wonderful pitchers and carnivorous habit of *Nepenthes* have both originated by natural selection out of one such honey-secreting gland as we still find developed near that part of the pitcher which represents the tip of the leaf? We may suppose insects to have been entangled in the viscid secretion of such a gland, and to have perished there, being acted upon by those acid secretions that abound in these and most other plants. The subsequent differentiation of the secreting organs of the pitcher into aqueous, saccharine, and acid, would follow *pari passu* with the evolution of the pitcher itself, according to those mysterious laws which result in the correlation of organs and functions throughout the kingdom of Nature, and which, in my apprehension, transcend in wonder and interest those of evolution and the origin of species.

Delpino has recorded the fact that the spathe of *Alocasia* secretes an acid fluid which destroys the slugs that visit it, and which he believes subserves its fertilisation. Here any process of nutrition can only be purely secondary. But the fluids of plants are in the great majority of cases acid, and, when exuded, would be almost certain to bring about some solution in substances with which they came in contact. Thus the acid secretions of roots were found by Sachs to corrode polished marble surfaces with which they came in contact, and thus to favour the absorption of mineral matter.

The solution of albuminoid substances requires, however, besides a suitable acid, the presence of some other albuminoid substance analogous to pepsine. Such substances, however, are frequent in plants. Besides the well-known diastase, which converts the starch of malt into sugar, there are other instances in the synaptase which determines the formation of hydrocyanic acid from emulsions, and the myrosin which similarly induces the formation of oil of mustard. We need not wonder, then, if the fluid secreted by a plant should prove to possess the ingredients necessary for the digestion of insoluble animal matters.

These remarks will, I hope, lead you to see, that though the processes of plant nutrition are in general extremely different from those of animal nutrition, and involve very simple compounds, yet that the protoplasm of plants is not absolutely prohibited from availing itself of food, such as that by which the protoplasm of animals is nourished; under which point of view these phenomena of carnivorous plants will find their place, as one more link in the continuity of nature.

SECTION E.—Saturday, August 22.

Dr. W. B. Carpenter gave a summary of the results of the *Challenger* researches into the physical conditions of the deep sea. He said it would be interesting for the audience to know that the idea of such an expedition originated in Belfast. In 1868 he was over on a visit to Dr. Wyville Thomson, studying some peculiar specimens of crinoids. It was the time of the expected Fenian invasion, and Dr. Thomson suggested that the use of one of the gunboats should be obtained for making deep sea soundings. The subject was represented to the Government, and the use of the *Lightning* was granted. Explorations were carried on between the Faroe Islands and the North of Scotland, and the remarkable discovery made that the water at different depths was of different temperatures—the old theory being that the sea was of a uniform temperature of 39°. In the following year, on the representation of the Royal Society, the *Porcupine* was placed at the disposal of Dr. Carpenter, Dr. Gwyn Jeffreys, and Dr. Thomson, and the results obtained in the preceding year were verified by soundings taken with the improved thermometers round the Faroe Islands and off the coasts of Spain and Portugal. A succession of soundings gave rise to the conclusion that in the channel off the Faroe Islands there were two distinct strata of water—a glacial stratum of about 300 fathoms in thickness, underlying another stratum of about the same thickness, one formed of cold polar water and the other of warm equatorial water. Then came the *Challenger* expedition, which made a temperature survey of the Atlantic between 38° N. lat. and 38° S. lat. Soundings were made at different stations and at different depths, and from the results Dr. Carpenter was led to the theory of a great ocean circulation, independent of wind or of movements similar to the Gulf Stream. By this circulation the temperature is equalised; the temperature of the equatorial water being reduced by the flow of polar water south, and that of the Arctic water raised by a flow of equatorial water north. The cause of the colder water sinking was that it was of greater salinity, and therefore, continuing to contract to freezing point, it had a tendency to sink. The soundings of the *Challenger* showed that the great under-stratum in the Atlantic was about 35°, and that the upper strata varied from 40° to 80°. Off Nova Scotia a strange phenomenon was noticed. It was found that between the Gulf Stream and the coast, and even under the Gulf Stream, there was a band of water below the normal latitude running southward, which is only to be referred to the definite movement of polar water towards the equator combined with the motion of the earth; for, as the north-moving warm upper stratum constantly tends towards the east, in virtue of the excess of easterly momentum which it brings with it from a portion of the globe whose rotary movement is more rapid, so the cold under-stratum, if moving southwards from a portion of the globe whose rotary motion is less rapid, will bring with it a deficiency of easterly momentum, or, in other words, will tend towards the east. The reduction in the salinity of the surface water at the Equator, as indicated by specific gravity, was brought out clearly by the expedition, and afforded a striking indication of the ascent of bottom water towards the surface, which, on the theory of the vertical circulation, will take place in the equatorial region, where the two polar underflows meet, while the warm upper layer is being constantly drafted off towards either pole. The effect of the general oceanic circulation in moderating what would otherwise be the unbearable heat of the inter-tropical ocean was then pointed out. In the Red Sea, where there is no upward movement of glacial water, owing to the shallowness of the Straits of Babel Mandeb, the surface temperature is highest. In the equatorial mid-Atlantic it is seldom above 80°. On the other hand, the north-easterly flow of warm water greatly ameliorates the climate of North-western Europe. Dr. Carpenter controverted the theory that this amelioration is due to the Gulf Stream, and pointed out the difference of the climatic modifications in the Northern and Southern hemisphere. Between the Arctic basin and the Great Northern Ocean there was a comparatively limited passage in the channel between Greenland and Iceland, whilst between the Antarctic and the Great Southern Oceans there was an unrestricted communication. The effect of this is to bring a much larger body of polar water into the South Atlantic basin, so that the isotherm of 40° lies in every part of it much nearer the surface than it does in the North Atlantic.

The Mediterranean was found to differ very much from the Atlantic Ocean. The surface water in summer ranged from 73° to 80°, sinking at fifty fathoms to about 54°; whilst from 100 fathoms to the bottom there was a constant temperature of from 54° to 55°. In winter the temperature is uniform from the surface to the bottom, and Dr. Carpenter is of opinion that the uniform temperature of the Mediterranean corresponds with the lowest winter mean. As the sun gains in power the temperature of the superficial stratum is raised, but the summer heat cannot penetrate far downwards. The absence of thermal circulation in the deeper parts of this great basin is the necessary consequence of the uniformity of its temperature.

In conclusion, Dr. Carpenter alluded to the labours of Professor Lentz, of St. Petersburg, in connexion with oceanic thermal circulation, based on the observations made in the second voyage of Kotzebue during the years 1823-6, but with which he did not become acquainted until he had published the theory himself.

SECTION B.—Monday, August 24.

Mr. Jeremiah Head read a paper on "A Higher Education for Engineers." He commenced by referring to the intrinsic natural advantages of this country, and the dependence of British industry upon mineral products. He said that industrial manufactures would, in future, continue to expand or dwindle away in proportion to the enlightenment with which British engineers administered the natural resources committed to their charge. The paper was mainly devoted to the solving of the question of—"How far the quality of engineering education, as commonly met with in this country, is suited to the great and increasing claims made thereon?" The term of engineer, he said, was a very ambiguous one; but he regarded as the best engineer the man who was able, as various necessities arose, to utilise in the best and most economic manner the materials of the earth for the benefit of its inhabitants. One of the subjects with which he thought an engineer should be familiar in order to ensure success in all his undertakings, was a knowledge of the elements of which the earth was composed, and their several properties, which would involve a study of chemistry. Having acquired this knowledge, he who desired to *deserve* the name of an engineer must proceed to make himself acquainted with the various *moods* or conditions in which these substances may exist. This would plunge him into a study of physics, wherein were comprised the laws of motion, force, gravity, cohesion, and chemical attraction. Mechanics proper, which was divisible into statics and dynamics, was a department of physics. It further included the

consideration of the three states of matter—solid, liquid, and gaseous—and all the phenomena arising thereout. It had also appropriated all accurately ascertained knowledge concerning energy, potential and actual, and concerning vibratory motion, whether as manifested by sound, light, heat, or electricity. One of the principal branches of engineering in all countries was that appertaining to mines, and successful mining was impossible without a correct knowledge of geology, and its kindred science, mineralogy. A knowledge of physical geography was also essential in the design and construction of ocean steamships, in the laying of submarine cables, in arrangements for the supply of water to large populations, in drainage, in mountain railways, in sub-mountain and submarine tunnels; in docks, harbours, piers, and various other works. An engineer, to be a true and intelligent leader of industrial enterprise, must also have sound views in regard to economic science, in order to be able to solve the difficulties which were ever recurring between workmen and their employers. There were other studies without which success could not be commanded in any important sphere of usefulness, such as mathematics, accounts, commercial law, logic (comprising inductive and deductive reasoning), rhetoric, and accounts or book-keeping, upon which rested all sound financial and commercial operations. An engineer's operations, however gigantic, must always count as failures, unless they could be made commercially to pay. In this respect lay the main difference between Robert Stephenson and his rival, I. K. Brunel. The enterprises of the former always proved paying investments, while those of the latter were generally quite the reverse. Every engineer should also understand the general principles which underlie our legal and judicial system in order to conduct Public Works' Bills successfully through Parliamentary committees. The reason why an engineer should study rhetoric was not so much for the purpose of making speeches, as to be able to state what they had to say briefly, clearly, and forcibly, and if elegantly so much the better. There were other two departments which ought to be included in a higher education for engineers—physiology and professional morals. Though engineers were conversant with every corner of the universe, yet their knowledge was liable to become worthless unless they understood and recognised the nature and mode of operation of the human mind and body. Were all men physiologists we should certainly cease to hear of tables jumping up against ceilings, or spirits wafting hypochondriacs among the London chimney-pots, or inspired tambourines bumping their devotees about the head in darkened rooms. And (which is infinitely more important) we might hope eventually to see them become as really patient, honest, accurate seekers after light and truth, as they are now so often dogmatic and obstinate retailers of whatever notions they may happen to have imbibed from those among whom they may chance to have lived, and who have, perhaps, taken the same pains to cramp their minds as Chinese mandarins do to cramp their daughters' feet. The question might be asked, What connexion can possibly exist between engineering and *morals*? By "*morals*" he meant the science of distinguishing between that which is *right*, or compatible with life in a highly organised condition, and that which is *wrong*, or tending to the dissolution of society. The two most important moral questions affecting engineers at the present moment, were, first, the custom of giving and receiving gratuities, commissions, douceurs, presents, and whatever other names might be bestowed upon attempts to swerve the conduct of those in positions of trust from the strict path of honour and integrity; and secondly, the prevalent custom of unfairly decaying away workmen, or superior assistants, after time, trouble and expense have been incurred in training or adapting them to their positions. In conclusion, Mr.

Head said that in making the above suggestions he was not advocating any violent revolution or sweeping change. He did not wish to convey any other idea than that death alone should terminate education. He thought that if the programme he had suggested, especially if amplified, as might be done, would afford work for a lifetime. This should not be deemed discouraging; for, if only those who directed education could clearly foresee what the work of a particular life was destined to be, many a filip might be given in a helping direction, and many an erring tendency might easily be counteracted in boyhood, youth, and throughout manhood. He had observed that the Council of the Institution of Civil Engineers recommended contributors of papers to take as their model Smeaton's *History of the Building of the Eddystone Lighthouse*. He thought that there could not be a better type of what engineers should aim at being than that marvellous structure. Founded upon the solid rock, and the lowest courses of granite blocks dovetailed into the same, its form was such that a century of Atlantic storms had been unable to shake it. The lower part was solid, and so spread out towards the rock that the question arose, Where would it break if a sufficient storm did attack it? Hardly above, for that part was out of the reach of the waves. Hardly below, because the lower, the wider and the stronger it was down to the solid rock. So should the knowledge of engineers be: the lower, the deeper, and the more fundamental, should also be the wider, the more thorough, and the more absolutely accurate.

SECTION A.—Monday, August 24.

Mr. Robert H. Scott, M.A., F.R.S., in a paper on "The Importance of improved Methods of Registration of Wind on the Coast, with a Notice of an Anemometer designed by Mr. W. De La Rue, F.R.S., to furnish Telegraphic Information of the Occurrence of Strong Winds," said: It is hardly necessary to draw the attention of the Section to the fact that the configuration of the earth's surface exercises an overwhelming influence on the wind both as to its direction and force. Some statements and tables contained in a paper* of mine in the last number of the *Quarterly Journal of the Meteorological Society* abundantly prove this assertion; and it is, therefore, easy to see what an imperfect representation of the actual force of the wind at sea can be furnished by reports from a broken and mountainous coast, such as the Atlantic coasts of Ireland and Scotland, where the telegraphic stations are perforce situated in sheltered places, inasmuch as harbours are naturally found where there is as little exposure to wind as is possible.

In the practice of weather telegraphy and storm warnings, as the number of reports received per day from each station is strictly limited, from financial considerations, it is quite obvious that if the actual epoch of the commencement of a gale does not fall within the hours of attendance at the telegraphic office, and at the Meteorological Office, which practically only extend from 8 A.M. till 3 P.M., much time will be lost in sending news of the fact to London. If it commences at 6 P.M. at Valencia, we cannot hear of it in London till 9 A.M. next morning.

On the other hand, if the observer be living in a sheltered spot, such as Plymouth, Nairn, or Greencastle, we shall not get a true report of the gale at all, inasmuch as the observer will not have felt it himself. The first-named defect in our system can only be met by a considerably increased expenditure on the service, and that is not a scientific but an administrative question, with which the Government can alone deal. In

order to meet the second difficulty, Mr. De La Rue has kindly devised an instrumental arrangement by which the fact of any given force of wind having been reached at an exposed point (such as Rame Head for Plymouth, or Malin Head for Greencastle), can be at once conveyed to the reporter in his own office, or even to the central office in London. The instrument has been made by Messrs. Negretti and Zambra.

The following is the construction of the new signalling anemometer:—To the ordinary Robinson's anemometer spindle is affixed a toothed wheel, which is geared with another and larger toothed wheel fixed on a second vertical spindle, which carries a centrifugal governor. The governor spindle is made to rotate at one-half or one-third of the velocity of the anemometer spindle, in order that the rods carrying the governor balls may not have to be made inconveniently short. A provision is made for adjusting the length of the arms of the governor so that the different wind velocities may be indicated within certain limits.

The governor balls act in the well-known way, and expand when driven at a given rate, and the upward motion of these governor balls is used to raise a secondary wheel to bring into gear a third spindle, on which is fixed the armature of a magneto-electric apparatus, which, like Sir Charles Wheatstone's instruments, consists of a compound permanent magnet with four soft iron covers, two of which are mounted on the N. pole of the magnet, and two on the S. pole. These iron covers are surrounded with fine insulated copper wire, and on rotation of the armature give alternately + and - currents in rapid succession, according to the rate at which the armature is driven. These currents are conveyed inland to the observing station by insulated wires, and give warning by ringing an alarm as long as the anemometer cups are revolving at a velocity sufficient to raise the governor balls so as to bring the magneto-electrical apparatus into gear.

We see, therefore, that by adjusting the governor of the apparatus to indicate any required speed, a warning will at once be given when the wind reaches that speed, be it that of sixty, forty, or twenty miles an hour, as may be required.

All the attention which the instrument requires after the apparatus is fixed is to lead two insulated wires from the anemometer into the observing station, and to connect these wires to the two terminals on the alarm.

In order to enable the observer to communicate at once, and at as little expense as possible, to London, the fact of the velocity in question having been reached, the individual stations might be known by letters or symbols which might simply be telegraphed to London as an announcement that the alarm was acting at the station in question.

It is obvious that this plan is exceedingly simple, and there seems little reason why it should not be thoroughly efficacious, if only the registering portion of the apparatus can be properly protected from wilful damage by mischievous persons.

As usual, we are met by the question of cost, not only of the apparatus, but of the connecting wires, and last, though not least, of the transmission of the messages. To enable us to render our service more effective than it is, we must be supplied with the sinews of war. The 3,000*l.*, which is the very utmost we spend annually on telegraphy, including salaries, rent, and every item, is but small compared with the 50,000*l.*, entirely exclusive of salaries, with which the chief Signal Office of the United States is so munificently endowed.

SECTION F.—Monday, August 24.

Mrs. Wm. Grey read a paper on the Science of Education:—Education should be conducted in accordance with the laws, or, to use a less ambiguous word, with the order of nature, physical, mental, and social. We should hold him a fool

who trusted his farm, his gardens, or his racing stud to persons ignorant of the first principles of agriculture, gardening, or horse-breeding; yet we unhesitatingly trust our children, during the years when every faculty is most plastic, and their natures most sensitive to external influences, first to servants ignorant of everything but the routine prescribed by their masters, and then at a later, but not less critical age, to tutors and governesses, who may know Greek and Latin, French and German, but have never even thought of learning anything of the nature of the pupils they undertake to educate, or of the complex conditions of every kind which must influence them for good or evil. Every mother is credited with an instinctive knowledge of infant management, as if the wants of a child were as simple and as easily supplied by instinctive affection as those of the chick or the lamb, and it is adduced as the principal reason for denying to women any higher training than that of the average schoolroom that they are intended to be mothers, and therefore cannot want it! The whole progress of education is of the happy-go-lucky kind, governed by practical necessities, by customs, fashion, class habits and prejudices, by anything but a well-defined purpose, and a scientific method of attaining it. There can, of course, be no science of such an education as that. But in days when scientific conceptions are taking the place of unscientific ones in every department of human production, surely it is time that we should form some such conception of the progress which should result in the most valuable of all products—human beings developed to the full extent of their natural capacity, trained to understand their work in this world, and to do it. We can by the application of scientific methods arrive at this result—not with certainty, for the factors are too numerous, and their interaction too complicated, to admit of anything like complete certainty—but with, at least, that approximate certainty which we feel when a vessel goes to sea well built, well equipped, well manned, and well commanded, that she will reach her destined port. The human being we have to deal with has a threefold nature—physical, intellectual, and emotional—blended into one indivisible unity, yet subject to different and often conflicting sets of laws, and endowed with the power of volition, which makes him a responsible agent. Certain elements of his constitution are common to him with the whole human race; others are common to him and that division of the human race to which he belongs; others common only to his immediate line of descent; and others peculiar to himself, and forming that element of variety from a common type which constitutes his individuality. He is placed under external conditions, physical, mental, and social, which, like the elements of his constitution, may be classed under different degrees of generality, some being common to all human beings, some to all of his time and country and social position, and some peculiar to himself, and forming his individual lot. In the attempt to arrive at general principles, we must, of course, leave out of consideration what is peculiar to individuals, although the study of it will form the most important part of the practical educator; just as the scientific pathologist, in his general diagnosis of disease and its treatment, leaves out of sight the idiosyncrasies of particular patients, which yet are the principal study of the practising physician. But, after deducting this element of individuality, there is left the wide field of general facts and forces, and the study of the combination of these forces and their resultant influence on the formation of character is the study of education as a science. We must learn the natural order of development of the moral and intellectual powers, and their relations to each other as the legislative, the executive, and the subject powers in the constitution of man, and thence deduce the methods by which the growth of his faculties may be aided, and this due hierarchy of powers be maintained.

* "An Attempt to establish a Relation between the Velocity of the Wind and its Force (Beaufort Scale), with some Remarks on Anemometrical Observations in general." By Robert H. Scott, F.R.S.—*Quart. Journ. Met. Soc.*, vol. ii., p. 109.

This will include not only right methods of teaching, but what subjects ought to be taught, in accordance with the natural order of development, and thus set at rest the ceaseless controversies about what should or should not be taught in schools for boys or girls, or to different classes of society, and give a final answer to that eternal *cui bono* which is the bane and the torment of every educational reformer, the leading of the imagination to conceive, and the heart to love and worship, pure and noble ideas, finding their sum and perfection in the supreme ideal God. How these supreme objects are attained must be learnt by the study of the mental laws of association and attention which govern the formation of habit, passive and active. When we know how to form habits, we shall have gained the master power of education—the power of creating what has been truly called a second nature—acting as instinctively as the original one. How little this is generally understood may be seen by the common phenomenon of education acting by contraries—the son of a miser turning out a spendthrift; the son of a pious clergyman becoming a profligate; a Luther issuing from an Augustine monastery; a Voltaire from a college of Jesuits. But the study of education as a science must include, besides physiology and psychology, which give only what may be called the statics of human nature, the study of its dynamics, human nature in action, as we see it in the world around us, and as it is recorded in history—not the mere history of wars and dynasties which ordinarily goes by that name, but the history of human societies—of human development through religion, art, science, and legislation. Only through such observations and study can we arrive at the springs of human action, and more especially at that spiritual or idealistic element which can as little be seized through the analysis of the psychologist as the vital force by an anatomical dissection, and which yet is the most potent of all; for, as Mr. Morley has truly said, men are governed by their ideals. In the study of education as a science must be included not only the education of individuals but that of nations. That nations have a character as well as individuals, and that their prosperity or failure equally depends upon it, all history attests. Can any question be more worthy of scientific study than how these characters are formed? What conditions favour the good and check the evil in them? How far are they modifiable at all by direct action of any sort, legislative or otherwise? How do legislative enactments affect the character of a people? and what are those defects in legislation which make it also act by contraries and produce and foster the very evils it was intended to check? If it be said that these questions concern the statesman rather than the educator, the answer is, that the statesman is an educator, and the most important of educators, since his work directly in some degree, indirectly in a very large degree, helps to form that social atmosphere which is the most active force in the education of each individual, and before which the wisest teachers will be comparatively powerless. The difficulty as to time makes it impossible to indicate, however briefly, all the practical questions requiring for their solution to be brought to the test of a scientific theory. But there are some which have such a paramount importance at the present time, and bear so immediately on our whole educational system, that they must at least be alluded to. The first of these is the question of class in education. In England and Ireland we have, as a rule, preserved in our educational arrangements the class distinctions which prevail in our society, whilst, as is well known, in Scotland, which had the earliest system of national education, in Germany, in Switzerland, and in the United States, no such distinctions prevail, and the primary school, the secondary school, and the university form parts of one whole, each giving the instruction suited to a particular age and period of mental development, not to a

particular social class. The important study of the two systems in their moral and social, as well as purely educational results, leading to some authoritative expression of the balance of evidence on either side, would greatly assist us in dealing with the general problem of national education, and guide us in the gradual remodelling of our educational institutions, now going on under the impulse of that vast movement of transition which characterises our epoch. A second problem preparing for solution is that of sex in education, and as there is none that touches on such burning questions, so there is none that more urgently requires to be considered in the spirit of scientific enquiry, which sets aside prejudice and partisanship, and seeks the truth only. Whether the difference between the sexes is one of kind, of degree, or of proportion between the various mental and moral faculties, and how the difference should be dealt with in education; whether the best training for both sexes can be given by the same methods, and under similar school arrangements, by the mixed or by the separate system; whether regular and sustained mental effort, under the hygienic conditions equally essential for both sexes, carried on through the transition from girlhood to womanhood, is injurious to the perfect development of women's physical constitution, or tends rather to calm and steady the nervous system, and establish the healthy balance between the intellectual and emotional nature essential to the sound mind in the sound body—what, in short, is the true type of perfect womanhood, and by what process of education it is to be developed. All these questions are waiting for thorough, and impartial study, and it is not too much to say that on their right solution the future health and happiness of the race largely depend. The last point is the system of examinations, which has of late years assumed such vast proportions as practically to govern our whole scholastic system. Examinations, which were intended to test the progress of the learner, are now in danger of becoming the sole end and aim of learning. Instead of the examination following, as it ought, the lead of the teaching, the teaching all works up to the examination. It is, therefore, of primary importance that we should decide on some scientific principle what is the right system of examination: whether it should be mainly directed to test the acquisition or retention of knowledge, or the power of using the knowledge acquired; whether the knowledge tested shall be that of words and rules, or of ideas and principles underlying the rules; whether the power it rewards shall be that of accurately recollecting facts, or of accurately reasoning from the facts remembered. Since an examination is now made the inevitable portal through which every professional career must be entered, as is our system of examination, so will be our system of education; the results it tests and rewards will be the only ones aimed at. And yet even here, in this Association, where every science has an illustrious representative except this one of education, and it has for its advocate only a woman—a woman and, therefore, weak; a woman and, therefore, debarred from aiding her weakness by the higher training reserved for the stronger sex only—even here this science, so little thought of, so contemptuously ignored, is the crowning science of all, for it is the application of all the sciences to the production of the highest of all results, the perfect man, brought up to the measure of the standard of the fulness of that Divine image whose germ was implanted in our nature, when, in the long series of his evolutions from the primeval monad to the human being, so fearfully and wonderfully made, "the Lord God breathed into his nostrils the breath of life, and man became a living soul."

SECTION A.—Tuesday, August 25.

The Earl of Rosse, F.R.S., exhibited a large photograph of the moon, which, he said, had been lent to him by Mr. Warren De La Rue, who had

had much to do with the construction of the great reflector of the Melbourne telescope, with which the picture was taken. Although the great telescope at Melbourne had been in use for some time, it was the first really successful photograph of the moon which had been taken with it, partly because the reflector had been used for other work, and partly because the nights on which good lunar photography is possible are so very few. Currents of air of different densities were usually moving in large volumes one above the other, and these so refracted the rays of light as to cause the stars to appear to the eye to twinkle, and to cast unsteady images of the different parts of the moon when the reflector was used in the attempt to obtain photographs. Hence, not only must the sky be clear, but the air very still at all elevations before good lunar pictures can be obtained; so it was not surprising that in the short period which elapsed after the reflector was made and before it left Dublin no good photographs were taken. Before the advent of the photograph he was then exhibiting, the best that had ever been taken had been obtained by Mr. Rutherford, of New York, who used a refractor for the purpose: the lens had been made specially for the work, and had been ground to bring the blue and violet rays of the spectrum to a sharp focus on the sensitive plate, since these rays, and not those which are most luminous to the eye, are those which exert an influence over the chemical substances contained in photographic films. Mr. De La Rue had taken many beautiful photographs of the moon at his observatory at Cranford, and was noted for his skill in the work; but he believed that Mr. De La Rue was of opinion that Mr. Rutherford had obtained a better photograph of the moon than himself, the atmospheric conditions chancing to be so good on one particular night. Although Mr. Rutherford had obtained his good picture so far back as 1865, he had never been able to obtain another equal to it since; therefore the single picture did not prove that a refractor was better than a reflector for lunar photographic work, but simply that atmospheric conditions were exceptionally good on a particular evening. He had carefully compared Mr. Rutherford's picture—of which he possessed a copy—with the one taken with the Melbourne reflector, and thought that the latter was slightly the better of the two. He could not, however, speak with certainty, and should like to have the aid of good photographic critics. Both pictures had been enlarged from the original negatives, and Mr. Rutherford's had been much more enlarged than the other. The original negative taken with the Melbourne reflector was about three and a half inches in diameter. The phase of the moon was nearly the same in both pictures.

SECTION D.—Tuesday, August 25.

PROFESSOR HUXLEY said at this period of the meeting of the British Association he was quite sure it would be unnecessary for him to call to their minds the nature of the business which took place at their sectional meetings. They there registered the progress which science had made during the past year, and did their best to advance that progress by original communications and free discussion. But, when the honourable task of delivering that lecture was imposed upon him, it occurred to him that the occasion of an evening lecture might be turned to a different purpose—that they might then, with much propriety and advantage, turn their minds back to the past, and consider what had been done by the great men of old, who had gone down to their graves with their weapons of war—who fought bravely for the truth while they lived; and, when recognising their merits, they should feel grateful for their services. He proposed, therefore, to take a retrospect of the condition of that branch of science with which it was his business to be more or less familiar. He would not go back to a very remote period. He

would not go further back than the seventeenth century; and his observations would be confined almost entirely to the science of the time between the middle of the seventeenth century and the middle of the eighteenth century. He proposed to show what great ideas in biological science took their origin at that time, and in what manner the speculations then originated have been developed, and to note the relation in which they stand to what is now understood to be the body of scientific biological truth. The middle of the sixteenth century, or rather the early part, was one of the great epochs of biological science. It was at that time that an idea which had been dimly adumbrated previously took that solid form which can only be given to scientific ideas by the definite observation of fact—he meant the idea that vital phenomena, like all other phenomena of the physical world, are capable of mechanical explanation, that they are reducible to law and order, and that the study of biology in the long run is an application of the great sciences of physics and chemistry. The man to whom they were indebted for first bringing that idea into a plain and tangible shape, he was proud to say was an Englishman—William Harvey. William Harvey was the first clearly to explain the mechanism of the circulation of the blood; and by that remarkable discovery of his, and by the clearness and precision with which he reduced that process to its mechanical elements, he laid the foundation of a scientific theory of the larger part of the processes of living beings—those processes which are now called processes of sustentation; and, further, by his studies of development he first laid the foundation of a scientific knowledge of reproduction. But, besides these great powers of living beings, there remained another class—the functions of the nervous system, with which Harvey did not grapple. It was left to a contemporary of his, René Descartes, to play a part in relation to the phenomena of the nervous system, which, in his judgment, was precisely equal in value to that which Harvey played in regard to the circulation. And when they considered who Descartes was, how brief the span of his fifty-four years of life, the lecturer thought it was a truly wonderful circumstance that this man, who died at fifty-four, should be one of the recognised leaders of philosophy. Descartes' propositions on this subject he would lay before them, and each of them he would compare as briefly as might be with the existing state of physiological science, in order to show in what position with respect to physiology—ay, even the most advanced physiology of the present time—this man stood. And, happily, said Professor Huxley, the matters with which we shall deal are such as to require no extensive knowledge of anatomy—no more, in fact, than such as, I presume, must be familiar to almost every person. I think I need only premise that what we call the nervous system in one of the higher animals consists of a central apparatus composed of the brain, which is lodged in the skull, and of a cord proceeding from it, which is termed the spinal marrow, and which is lodged in the vertebral column or spine, and that from these soft, white masses, for such they are—there proceed cords which are termed nerves, some of which nerves end in the muscles, while others end in the organs of sensation. That bald statement of the fundamental composition of the nervous system will be enough for our present purpose. The first proposition that you find definitely and clearly stated by Descartes is one which you will find very familiar to you at the present day. It is a view which he was the first, so far as I know, to state, not only definitely, but on sufficient grounds, that the brain is the organ of sensation, of thought, and of emotion—using the word organ in this sense, that certain changes which take place in the matter of the brain, are the essential antecedents of those states of consciousness which we term sensation and thought and emotion. Now-

adays that is part of popular and familiar knowledge. If a friend disagrees with your opinion, runs amuck against any of your pet prejudices, you say, "The poor fellow, he is a little touched here," by which you mean his brain is touched—he is not thinking properly, thereby implying that his brain is in some way affected. But in Descartes' time, and I may say for 150 years after, the best physiologists had not reached that point. It remained down to the time of Bichat open to question whether the passions were or were not located in the abdominal viscera. It is a notion which points scientific investigation for a moment, and, therefore, this in itself was a very great step. It is a statement which Descartes makes in the beginning, and from which he never swerves. In the second place, Descartes lays down the proposition that all the movements of animal bodies are effected by a change of form of a certain part of the material of their bodies, to which he applies the general name of muscle. You must be aware of this, that in reading Descartes you must use the terms in the sense in which he used them, or you will not understand him. That is a proposition which is now placed beyond all doubt whatever. If I move my arm, that movement is due to a change of this mass of flesh which is placed in front of it, the biceps muscle. It is shortened and it becomes thicker. If I move any limb, the reason is the same. As I speak, the different tones of my voice are due to the accurately adjusted complication of a multitude of particles of flesh; and there is no considerable movement in the animal body which is not, as Descartes said, resolvable into those changes of form of the matter which is termed muscle. But Descartes went further, and stated that in the normal and ordinary condition of things these changes in the form of muscle in the body only occur under certain conditions; and the essential condition of the change was, says Descartes, the motion of the matter contained within the nerves, which go from the central apparatus to the muscle. Descartes gives this moving matter a particular name. He called it the animal spirits. Nowadays we should not say that the animal spirits existed; but we should say that a molecular change takes place in the nerves, and that that molecular change is propagated at a certain velocity, from the central apparatus to the muscle. Nevertheless, you will perceive that the modification in the idea is not greater than that which has taken place in our view of electricity—in our change of conception of it as a fluid to our conception of it as a simple condition of propagated molecular change; so that the fundamental conception remains the same; and just as we say the molecular change which comes of contraction of the muscle is propagated from the central nervous system towards the muscle, so Descartes says the animal spirits flow from the central apparatus to the muscle. Modern physiology has discovered the exact rate of this change; but the fundamental conception remains exactly what it was in the time of Descartes. Thirdly, Descartes says that, under ordinary circumstances, this change in the contents of a nerve which gives us a contraction of the muscle is produced by a change in the central nervous apparatus—as, for instance, the brain. We say at the present time exactly the same thing. Descartes said the animal spirits were stored up in the brain and flowed out along the motor nerves. We say that a molecular change takes place in the brain that is propagated along the motor nerve. The evidence of that was abundantly supplied by experimental research, which showed the nerves had no activity in themselves—that if they were cut off close to the central apparatus the change was no longer propagated through them. That proposition then, also, was made completely good by modern research. But further, Descartes stated that the sensory organs, or those apparatuses which give rise to our feelings, and which, as he had

just said, were connected with the brain and other central apparatuses by nervous chords—that those sensory organs, when acted upon by those influences which give rise to sensation, caused a change in the sensory nerves, a flow of animal spirits along those nerves, which flow was propagated to the brain. In other words, if he (Professor Huxley) looked at a candle held before him, the light falling into his eyes, striking on the retina, gave rise to an affection of the optic nerve, which affection Descartes described as the flow of the animal spirits to the brain. What had been done since his time was to define this more carefully, to make out more precisely what were sensory and what motor nerves; and within quite a recent period, to ascertain the nature of the changes which go on and accompany those modifications in the nerve itself when this propagation takes place. But, he repeated, in all our present notions of the operation of the nerve they were building upon Descartes' foundation; not only so, but Descartes laid down over and over again in the most distinct manner a proposition which is of the most paramount importance, not only for physiology, but for psychology. Descartes said when a body which is competent to produce a sensation touches the sensory organs, as in the illustration he had just shown, what happened was a production of a mode of motion of the sensory nerves—what happened in that sensory nerve was nothing but the mode of motion; that mode of motion was propagated to the brain; that which took place in the brain was nothing still but a mode of motion. But, in addition to this mode of motion, there is, as everybody can find by experiment for himself, something else which is not a mode of motion, which can in no way be compared to motion, which is utterly unlike it, and which is that state of consciousness which we call a sensation. Descartes insisted over and over again upon this total disparity between the agent which excites the state of consciousness and the state of consciousness itself. He told us that our sensations were not pictures of external things, but that they were symbols or signs of them. And in doing that he made one of the greatest possible revolutions not only in physiology, but in philosophy. Up to his time it was a notion that visible bodies, for example, gave off from themselves a kind of film which entered the eye, and so went to the brain, and thus the mind became aware of the actual body or pictures of the thing given off from it. It was to Descartes that they owed that revolution in their ideas which had led them to see that they had really no knowledge whatever of external things. In laying down that proposition upon what he believed to be an irrefragable basis, Descartes laid the foundation of that form of philosophy which is termed Idealism, which was subsequently developed to its uttermost by Berkeley, and has taken all sorts of shapes since. But Descartes noticed not only that, under certain conditions, an impulse made by the sensory organ might give rise to a sensation, but that, under certain other conditions, it might give rise to motion, and that this motion might be effected without sensation, and not only without volition, but even contrary to it. He would now ask their patience for a moment while he read a very remarkable passage from Descartes. In an answer to objections made by the famous Port Royalist Arnaud, Descartes said:—"It appears to me to be a very remarkable circumstance that no movement can take place either in the bodies of beasts, or even in our own, if those bodies have not in themselves all the organs and instruments by means of which the very same movement will be accomplished in a machine, so that even in us the spirit, or the soul, does not directly move a limb, but only determines the course of that very subtle liquid which, running continually from the heart, by the brain, into the muscles, is the cause of all the movements of our limbs, and often may cause many different motions, one as easily as the other.

And it does not always exert this determination, for among the movements that take place in us there are many which do not depend upon the mind at all, such as the beating of the heart, the digestion of food, nutrition, the respiration of those who sleep, and even in those who are awake, walking, singing, and other similar actions, when they are performed without the mind thinking about them; and when one who falls from a height throws his hand forward to save his head, it is in virtue of no ratiocination that he performs this action. It does not depend upon his mind; it takes place merely because his senses being affected by the present danger cause some change in his brain which determines the animal spirits to pass thence into the nerves in such a manner as is required to produce this motion in the same way as in a machine, and without the mind being able to hinder it." He (Professor Huxley) knew in no modern treatise of a more clear and precise statement than that, or a more perfect illustration of what they understood by the automatic action of the brain. And what is very remarkable, in speaking of these movements which arise by a sensation being as it were reflected from the central apparatus into a limb—as, for example, when one's finger is pricked and the arm is suddenly drawn up, the motion of the sensory nerve travels to the spine and is again reflected down to the muscles of the arm—Descartes uses the very phrase that we at this present time employ; he speaks of the *esprits réfléchis*, the reflected spirits; and that this was no mere happy phrase lost upon his contemporaries will be obvious on consulting the famous work of Willis, the Oxford professor, *De Anima Brutorum*, which was published about 1672. In giving an account of Descartes' views he borrows this very phrase from him, and speaks of this reflection of the motion of a sensory nerve into the motion of a motor nerve, *sicut undulatione reflexa*, as if it were a wave thrown back; so that we have not only the thing reflex action described, but we have the phrase "reflex" recognised in its full significance.

The last great service to the physiology of the nervous system which had to be mentioned as rendered by Descartes was this, that he first sketched out a physical theory of memory. What he said in substance was this, that when a sensation took place, the animal spirits travelled up the sensory nerve, passed to the appropriate part of the brain, and there found their way between the pores of the substance of the brain; and when that had taken place, when the particles of the brain were pushed aside a little, the passage was made easier in the same direction for any subsequent action, or for any subsequent flow of animal spirits, and consequently the repetition of that action made it easier still, until at length it became very easy for the animal spirits to move those particular particles of the brain the motion of which gives rise to the appropriate sensation. Professor Huxley continued to say that the result of the study of disease, the result of the action of poisonous substances, all conclusively pointed to the fact that memory was inseparably connected with the integrity of certain material parts of the brain; and he (Professor Huxley) knew of no hypothesis by which that was accounted for except by an idea which was essentially similar to the notion of Descartes—a notion that impressions once made, made subsequent impressions easier. So far, the ideas that were started by Descartes had simply been expanded or enlarged and defined by modern research. But in one respect Descartes proceeded further than any of his contemporaries, and had been followed by very few of his successors in later days, although his ideas were for the best part of a century largely dominant over the intellectual mind of Europe. He contended that there was clear evidence that the nervous system acted mechanically, without the intervention of consciousness or the will, which was illustrated by the fact that a man could not prevent the muscle of the eye from winking

when he thought he was going to be struck on the eye. It was a very singular thing that the boldest and most paradoxical notions which Descartes preached had received as much and as strong support from modern physiological research as any other of his hypotheses, which he would endeavour to explain in as few words as possible. If it should happen to a man that by an accident his spinal cord was broken across, he became paralysed below the point of injury. In such a case his limbs would be absolutely paralysed; he would have no control over them, and they would be entirely insensible. They might prick his feet or burn them, or do anything they liked with them, and they would be insensible. Consciousness, so far as they could have any knowledge of it, was entirely abolished in that part of the central nervous apparatus which lay below the injury. And if a man under these circumstances was paralysed in the sense of not being able to move his own limbs, he was not paralysed in the sense of their being deprived of motion, for if they tickled the soles of his feet with a feather the limbs would be drawn up just as vigorously, perhaps a little more vigorously, than when he was in full possession of the consciousness of what happened to him. That was what was called the reflex action. The impression was transmitted from the skin to the spinal cord, and the impression was reflected from the spinal cord, and passed into the muscles of the limbs, and they were contracted in this manner; and that action was purely automatic, and an entirely mechanical action. Suppose they dealt with a frog in the same way, and cut across his spinal cord. The frog was thus precisely in the same condition. So far as the frog was concerned, the limbs were useless; but they had only to apply irritation, and they had them drawn away. Now, if they had any ground for argument at all, they had a right to assume that, under these circumstances, the lower half of the frog's body was as devoid of consciousness as the lower half of the man's body. He repeated that, if they had any ground of reasoning in these matters at all—if they had a right to assume that the body of the frog below the section was in this case absolutely devoid of consciousness, was a mere machine like a musical-box, a barrel-organ, or a watch—then came a remarkable circumstance. In the first place, that movement of the limbs was purposive—that was to say, if they irritated the skin of the foot, the foot was drawn away from the danger, just as it would be if the frog were conscious and rational, and could act in accordance with a rational motive. But they would say it was easy to understand how such an action as that might take place mechanically. Let them, then try another experiment. Take this creature, which certainly could not feel, and touch the skin of the body with a little acetic acid or vinegar (which in the frog that can feel gives rise to considerable pain)—in that case there could be no pain, because the application was made below the point of section; nevertheless the frog lifted up the limb of the same side and applied the foot to the rubbing off of the acetic acid; but if they held down the limb of that side, so that the frog cannot use it, he would put up the limb of the other side and turn it across his body, and use it for the same rubbing off process. It was impossible that a frog, if it were in its entirety—if it were reasonable—could perform actions more purposive than that, and yet they had a complete assurance in that case that the frog was not acting from purpose, but was a mere irrational acting machine. But suppose that instead of making the section in the middle of the body—suppose they made it in such a manner as to divide the hindmost part of the brain from the foremost part—and suppose the foremost two-thirds of the brain taken away, the frog is then absolutely devoid of spontaneity. It would remain for ever where they left it; it would not stir unless it were touched; it sat upright, in the position in which a frog habitually did so. But it differed from the frog which he had just described in this, that if they threw

it into the water it began to swim, and swam just as well as a perfect frog did. Now, swimming, they knew, required a combination—a careful and delicate combination—of a great number of muscular actions; and the only way in which they could account for that was, that the impression upon the sensory nerves of the skin of the frog by the contact of the water conveyed to the central nervous apparatus a stimulus which set going a certain machinery by which all the muscles of swimming were brought into play, and that remarkable operation exerted. Moreover, if the frog be stimulated, be touched with any irritating body, although they were certain it could not feel, it jumped and walked as well as a complete frog could do. But it could not do more than that. Suppose yet one other experiment; suppose all that was taken away of the brain was what they called the cerebral hemispheres, the most anterior part; if that part was removed skilfully, the frog might be kept in a state of bodily vigour, perhaps, for months, or it might be for years, but it would sit for ever in the same spot. It saw nothing, it heard nothing; it would starve sooner than feed itself, although if food were put into its mouth it would swallow it. On irritation, however, it jumped or walked, and if thrown into water it swam. But the most remarkable thing it did was this—If they put it in the flat of their hand it would sit there crouched perfectly quiet, and would sit for ever; if they inclined their hand gently and slowly, so that the frog would naturally tend to slip off, they would feel the creature's fore paws getting slowly on the edge of their hand until it could just hold itself there so that it did not fall off; if they turned their hand vertically it would mount up with great care and deliberation, putting one leg in front and then another until it balanced itself with complete precision upon the edge of their hand; and if they turned their hand again it would go through the opposite set of operations, until it sat in perfect security upon the back of the hand. All that required a delicacy of co-ordination and adjustment of the muscular apparatus of the body, which was only comparable to that of a rope dancer among ourselves. In reference to physiological experiments, Professor Huxley mentioned a case which appeared in the *Journal des Débats* of a French soldier who was wounded at the battle of Bazeilles. He was shot in the left parietal bone; he recovered, and it was found that he was paralysed on the opposite side of the body—that is to say, his right arm and right leg were completely paralysed. He led two lives—a normal and an abnormal life. In his normal life he was an exceedingly honest, well-conducted man; but in his abnormal life he was an inveterate thief. When he was in the latter condition, the functions of his cerebral hemisphere were partially annihilated. That was a matter which greatly interested him (Professor Huxley), because it bore on the phenomena of mesmerism. If Descartes had had such facts before him, need it be said his theory of animal automata would have been enormously strengthened? He would have said, "Here I show you the case of a man performing actions infinitely more complicated, positively more rational than any of the ordinary operations of animals, and yet we have positive proof that these actions are taking place by pure mechanism." What objection, then, had they to urge against his doctrine that the whole animal world was in that condition, and that, although all these animals were capable of these actions, they could neither see, nor hear, nor smell, nor have any consciousness whatever. Descartes put forth that theory, and the more remarkable of his followers acted upon it; and he really did not know that they were in the slightest degree competent to give a definite and clear refutation to this hypothesis at the present day. They could have no comprehension of consciousness in any creature but themselves. The matter was one wholly incapable of demonstrative proof one way or another. But he must say for himself—taking

into account that great doctrine of continuity which forbade one to suppose that any natural phenomena came into existence suddenly, and that without some precedent gradual modification tending towards it—taking that great doctrine which was borne out by science on the one hand, and taking into account on the other the unquestionable fact that even the lowest vertebrate animals which possessed brains at all possessed in a small and rudimentary condition those parts which they had every reason to believe were the organs of consciousness in themselves—then it seemed to him vastly more probable that the lowest vertebrate animals, although they might not possess the sort of intensity and variety of consciousness which they had themselves, yet had it in a form proportioned to the comparative imperfection of the organ of that consciousness. He thought that that was probably the most rational conclusion that could be come to; and it had this advantage, which could not, he thought, with propriety be urged in questions that were susceptible of demonstration, but which was well worth taking into consideration in a case like the present, that it set us free of all the terrible consequences of making any mistake on this subject. He must confess that, looking at the course of nature, viewing the terrible struggle for existence everywhere going on in the animal world, and considering the frightful amount of pain which must be given and received in every part of the animal world if animals felt, that was a consideration which would incline one rather to Descartes' view. But, on the other hand, considering that if they regarded animals as machines they might be careless in their treatment of them or indulge in cruelties, he must confess that he thought it better, on the whole, to err on the right side, and not to agree with Descartes in that matter. But let him point out to them, that although they might come to the conclusion that Descartes was wrong in supposing that animals were insensible machines, it did not in the slightest degree follow that they were not sensitive and conscious automata; in fact, that was a view which was more or less clearly in the minds of every one of them. When they talked of the lower animals being provided with instinct and not with reason, what they really meant was, that although they were sensitive and conscious, yet they acted mechanically, and that their sensations, their thoughts, if they had thoughts, their volitions, if they had them, were the products and the consequences of their mechanical arrangements. He must confess that that popular view was to his mind the only one which could be scientifically adopted. They were bound by everything they knew of the nervous system to believe that when a certain molecular change was brought about in the central part of the nervous system, that change, in some way utterly unknown to them, caused that state of consciousness which they termed a sensation. In certain cases certain changes gave rise to conditions of pleasure and pain, and to those emotions which, in themselves, they called volition. He had no doubt that that was the relation between the physical processes of the animal and his mental processes. He took it that what they could show in one case among animals held good in all—that consciousness was a spectator and not an actor, that they are, in fact, conscious machines. Professor Huxley went on to say that, so far as he knew, the problem which he had hitherto been discussing was an entirely open one. He did not know that there was any reason whatever on the part of any person, no matter what his opinions were, which could prevent him, if so inclined, from accepting the doctrine which he had endeavoured to put before them clearly—that, so far as he knew, animals were conscious automata. That doctrine was perfectly consistent with any view that they might choose to take; and in respect of that view there were curious subjects of speculation—whether animals possessed souls or not; and

whether, if they possessed souls, those souls were immortal? The doctrine was not inconsistent with the Scriptural text concerning the "beast that perisheth." Nor, on the other hand, so far as he knew, did it impede anyone from entertaining the conviction ascribed by Pope to his untutored savage—that when he passed to the realms of the blest his faithful dog should bear him company. In fact, all these accessory questions involved problems which could not be discussed by physical science, inasmuch as they lay not within the region of physical science, but came within the scope of that great mother of the sciences—philosophy. He should not wonder if they were told by persons speaking with authority—not, perhaps, with that authority which was based on knowledge and wisdom, but still with authority—that his intention in bringing this subject before them was to lead them to apply the doctrine he had stated to men as well as brutes; and it would then, certainly, be further stated that the logical evidence of such doctrine is Materialism, Fatalism, and Atheism. Logical consequences were very important, for in the course of his experience he had found that they were a scarecrow to fools and a beacon to wise men. Logical consequences, he thought, could take care of themselves. The only question for any man who respected himself to ask was this—Was this doctrine true, or was it false? As he had said, the logical consequences of the doctrine could only serve as a beacon, warning a wise man to ponder well whether the doctrine be true or not. He believed that the doctrine referred to applied to man as well as to brutes. But he took leave to say that, in his conviction, there was no such logical connexion as was pretended between the doctrine which he accepted and the consequences which people pretend to draw from it. He did not say that here on this occasion for the first time. Many years ago he had occasion, in dealing with the philosophy of Descartes and other matters, to state his conviction pretty fully upon these subjects; and if those who cared to investigate these matters in a spirit of candour and justice would look into his writings, they would see his reasons for not imagining that such conclusions could be drawn from such premisses. To those who did not look into such matters with candour, and with the desire to know the truth, he had nothing at all to say, except to warn them on their own behalf of what they do, for assuredly if for preaching such a doctrine as he had preached that night he was cited before the bar of public opinion, he should not stand there alone. On his one hand he should have many theologians—St. Augustine, John Calvin, and a man whose name should be well known to the Presbyterians of Ulster, Jonathan Edwards—unless, indeed, it were the fashion to neglect the study of the great masters of divinity, as many other studies were neglected nowadays. He should have upon his other hand, among the philosophers, Leibnitz; he should have Père Malebranche, who saw all things in God; he should have David Hartley, the Anglican divine; Charles Bonnet, the eminent naturalist, and one of the most zealous defenders Christianity has ever had. He thought he should have, within easy reach, at any rate, John Locke—certainly the school of Descartes, whatever they are, if not their master; and he was inclined to think that in due justice a citation would have to be served upon Immanuel Kant himself. In such society it might be better to be the prisoner than the judge. But he would ask those who were likely to be influenced by the din and clamour which was raised about these questions, whether they were more likely to be right in assuming that these great men he had mentioned—the fathers of the Church, and the fathers of philosophy—knew what they were about, or that the pigmies who raise this din knew better what they meant. It was not necessary for any man to occupy himself with problems of this kind unless he so chose. Life was full enough, filled amply to the brim by the performance of its

ordinary duties. But let him warn them, let him beg them to believe that if a man elected to give a judgment upon these great questions; still more, if he assumed to himself the responsibility of attaching praise or blame to his fellow-countrymen for the judgments they might venture to put forward, unless he would commit a sin more grievous than most of the breaches of the Decalogue, he must avoid a lazy reliance upon information that was gathered by prejudice, and filtered through passion. Let him go to those great sources which were open to him as to every man, and to no man more than an Englishman; let him go back to the facts of nature, and to the thoughts of those wise men who for generations past had been the interpreters of nature.

SECTION C.—Wednesday, August 26.

Professor James Thomson read a paper on "The Jointed Prismatic Structure of the Giant's Causeway." He stated that the opinions prevailing among geologists as to the manner in which the jointed prismatic structure in basalt and other igneous rocks has arisen, involve generally one or other, or a combination of both, of the two following principles:—1st. Prismatic fracture by shrinkage in cooling, like the cracking which may be observed in starch or mud in drying. 2nd. An assumed spheroidal concretionary action of the lava or basalt in solidifying from the molten state. He had accepted, as appearing to be a part of the truth, the supposition of prismatic fracture by shrinkage in cooling, and about twelve years ago had offered a theory of the origin of the jointed prismatic structure, involving primarily that supposition, and which had been suggested or indicated to him by certain phenomena which he had observed in the stones of the Giant's Causeway. This theory, although having one fundamental supposition in common to it and to some other views which had been previously put forward, yet in other respects was altogether divergent from any such previous views. Whatever other attempted explanations of the jointed prismatic structure he had met with, indeed, appeared to him to be plainly and decidedly untenable. All that he had met with, whether founded on the supposition of prismatic fracture by shrinkage, or of spheroidal concretionary action, or of both together, appeared to him essentially to involve incongruous or impossible suppositions, or else to be quite vague and unsatisfactory. As for the spheroidal concretionary theory, he believes it to be founded on a total mistake. He regards the spheroids so often met with in decaying basalts or lavas as being not concretions at all, but as being the results of decay or decomposition penetrating from without inwards in blocks into which the rock has been divided by fissures, which may have arisen from various causes. From this and other reasons which he stated at length, he is led to give no credence whatever to the spheroidal concretionary theory of the jointed prismatic structure. The chief points of his own theory may be briefly sketched out as follows:—He supposes that the division into prisms has arisen by splitting—through shrinkage—of a very homogeneous mass in cooling; and that the cross-joints are fractures, which have commenced in the centre of the column, and have advanced to the outside, as a circle increasing in diameter. This mode of fracture, he thought, was evidenced by various markings and other indications on the stones. They usually show a remarkable symmetrical conformation round the outer parts of their cross-joint faces, presenting an appearance which had struck him as being like a complete circular conchoidal fracture, often with roughly figured rays from the centre, such as in the ordinary conchoidal fracture are seen emanating from the point where the blow has been struck. The cross-joints he takes to be posterior to the prismatic fissures. But according to the spheroidal concretionary theory they are supposed to be contemporaneous in origin with the

prismatic faces of the columns, both the longitudinal faces and the cross-joint faces being in that theory supposed to be different parts of the surfaces of spheroids growing larger in solidifying till they meet, and can grow no more; or till they "press against each other" and "squeeze" themselves together, so as to receive flattened faces, instead of a rounded form. And according to the views of some who maintain the supposition of prismatic fissure by contraction, and deny the spheroidal concretionary theory (Mr. Scrope, for instance—*Volcanoes*, second edition, 1862, p. 104) the cross-joints are supposed to be contemporaneous at each part of the length of the column, with the prismatic fissures at the same place; the cross-joints being supposed to be successive bounding faces between the solidified end of the column and the as yet molten lava, into which the solidification is advancing, and the prismatic fissures being supposed at each period to extend quite forward to the molten lava. Mr. Scrope's view, as he himself states in the passage referred to, comprises the supposition that the concavity of the ball-and-socket-like cross-joints ought to be always directed upwards; or, in other words, that each separate piece of the joint column ought, according to his supposition, to have its bottom convex and its top concave. The supposition is not verified, but is decidedly controverted by the basaltic columns of the Giant's Causeway, the cross-joints being often concave upwards, and often concave downwards, and often nearly flat. There are not many very distinct ways in which we can suppose a fissure to have spread across a column or prism of solid stone. First, if we for a moment suppose the fissure to have begun at one side of the column, and to have advanced across to the opposite side, we must expect to find the resulting fracture quite unsymmetrical, and presenting very different appearances at the places where it entered the previously unbroken stone prism, and where it came to its termination, leaving the column broken behind its advancing front. We find no such appearance; but, on the contrary, we commonly find a very remarkable appearance of approximate symmetry of character in the cross-joint, with respect to the different sides and angles of the column. Perfect symmetry is, of course, not to be expected, as the columns themselves are often far from being of any regular or symmetrical form; but so far as Professor Thomson's observations of the stones in the Giant's Causeway have extended, he believes no appearance is to be found indicating an advance of the fissure across the column, from one side to the opposite, in any of the joints which exhibit, in other respects, the usual remarkable features. There may, no doubt, be numerous cases of fractures due to shattering, by causes different from those which have produced the ordinary remarkable joints. Next, any idea that the cracking of the column could have simultaneously begun all round the circumference, and advanced to terminate in the centre, requires little more than to be brought before the mind for consideration to be rejected as untenable. There seems then to remain nothing to suppose but that the ordinary cross-joint fissures came into existence first in the interior of the column, and then flashed out towards the circumference. In order to produce the cross fractures commencing in the centre, he supposed that a longitudinal tensile stress must have existed in the middle of each column previously to the cracking of the cross-joints. To account for such a tensile stress, he suggested, as a probable hypothesis, that after the column was formed, chemical action, caused by infiltration of water, might cause an expansion of the outside of the column; and that the outer part, thus growing longer, would pull the internal part more and more intensely, until at last the internal part would give way and break into short lengths. The fissures thus formed, it is obvious, must stop short without extending quite to the outside of the column, as the pull causing the fracture in the interior is due purely to longitudinal push in the

outer part of the column. That outer part, therefore, will not be subjected to the pull at all, and so the enlarging circular conchoidal fracture should be expected to stop short without penetrating to the outside of the column, especially at the angles. In the event of the central part cracking, and so ceasing to bear a pull, the outer part being less resisted than before, would increase in length in the immediate neighbourhood of the new internal fissure, and so would bring parts nearer the circumference than before into the condition of being subject to a pulling stress. Also, the reverberation or tremor at the instant of the cracking might, it seems reasonable to suppose, carry the advancing circular edge of the fissure somewhat farther out than the region which would be subjected to a pull if the action were slow, instead of being by a start. The appearances of the cross-joints, with the central area of each like a circular or oval flattish face, or like the convex or concave form of a watch-glass, but not extending out quite to the angles, and usually not quite out to the sides of the columns, seem to be in accordance with the suppositions here made, and to give considerable corroboration to them. The cracks, if formed as supposed, without extending quite to the outside of the column, would constitute places of weakness, from which under the shattering influence of earthquakes or other causes, fresh fractures would readily proceed quite to the outside, severing the columns completely across; but these fresh fractures occurring in ways quite different from those in which the original circular ones had done, could not be expected to be in continuity with the supposed original circularly terminating fissures. Thus is accounted for the approximately circular outer boundary to the flattish or lunette-shaped middle part of the cross-joint, which is very commonly to be seen. On a visit to the Giant's Causeway, in the summer of 1869, Professor Thomson had noticed some phenomena tending to confirm his views. He met with several instances in which a small mass of stone, different in texture and in hardness from the rest of the basalt, showed itself in the cross-joint of the column; and in which the joint presented to his view the appearance as if the cross fracture had originated at and spread out from this spot of irregular quality. When this extraneous or irregular lump happened to be near the middle of a column, there appeared to emanate from it, in all directions, approximately straight but roughly-formed rays; and when the lump happened to be near one side of the column, the rays emanating from it spread out in curved forms like a brush, and the several rays in proceeding outwards seemed to bend gently somewhat toward the nearest external face of the column. This seemed as if they had tended to run so as at each moment to be advancing in a direction approximately perpendicular to the advancing circular or oval edge of the enlarging fissure. If a fracture originating at one side of a column were to advance across to the other side, and in so doing were to cut across any irregular lump in the mass, that lump would leave a kind of tail extending from itself forward in the direction of propagation of the fissure; but the part of the fissure formed before arriving at the lump would be scarcely at all influenced by the presence of that irregularity. A tail emanating in this way from an irregular lump or a vesicular cavity, and extending forward in the direction of advance of the crack, is continually to be noticed in the breakage of flints, glass, basalts, and other brittle substances. But the cases noticed at the Giant's Causeway, in which, from an included lump, the lines radiated out in various directions, and were curved when the lump was eccentric, tend to corroborate the supposition that the fissure had its beginning at the irregular lump, where some local weakness or overstraining might exist, and that it flashed out from thence towards the circumference of the column. In conclusion Professor Thomson referred to the important light thrown on the subject of basaltic rocks by

Mr. C. Roberts in his communication to this section a few days ago. After intensely heating fire-clay bricks and allowing them to cool, he at pleasure produced a prismatic structure by breaking the brick, but the structure was without the cross-joints. The Professor then explained that basaltic columns had not necessarily cross joints, as they had often been found at great length quite continuous, and he had himself found such columns in the excavations of the Belfast cemetery.

FINE ART.

MR. FOLEY.

JOHN HENRY FOLEY, the "eminent" sculptor, as he might be conventionally called, and really not only an eminent but an excellent sculptor, died on August 27, at the comparatively early age of fifty-six. He was an Irishman, born in Dublin in 1818. He studied first at the school of the Royal Dublin Society of Art; and afterwards in the London Royal Academy, having come over to the English capital in 1834. Here he soon attracted some attention, confirmed when his model of *Innocence*, and the *Death of Abel*, were exhibited in 1839. In 1840 he attained renown by his *Ino and Bacchus*: a work, however, which at the present day ranks rather low in the total of his performances. The *Youth at a Stream*, displayed in Westminster Hall in 1844, was greatly superior to the *Ino and Bacchus*: it remains to this day one of the best examples of the combination, in modern sculpture, of a certain ideal antique grace with a simply natural motive, and true realisation of form. These two statues obtained for Mr. Foley a commission to execute sculptural works for the new Houses of Parliament: the *Hampden* and *Selden* in St. Stephen's Hall were the result. Other works might be particularised: *The Mother* (1851); *Egeria* and *Caractacus* in the Mansion House, &c., &c. His very best productions, however, have been in the way of portrait-sculpture. The colossal equestrian statue of *Lord Hardinge*, erected in Calcutta after being for some while on view in London in the courtyard of Burlington House, would alone be enough for reputation—or the *Lord Clive* at Shrewsbury. The *Outram* lately set up in Waterloo Place was full of fiery but self-possessed strength; and the *Lord Herbert* in front of the War Office is remarkable for the expression of thought, not merely indicated in the countenance, but informing the entire figure, even to its robing. Some other portrait works of uncommon mark, from Mr. Foley's hand, have been set up in his native Ireland. He was elected A.R.A. in 1849, and R.A. in 1858. He was, we believe, popular among his brother artists; free from pompousness or self-assertion; interested in the efforts of others, and the cause of art generally; and glad to do a good turn to any deserving aspirant.

There is little danger in prophesying that Foley will permanently retain high rank among our native sculptors, in virtue of his monumental portraits. They are works of excellent balance. He is more spirited than this sculptor, more manly than that, more graceful than a third, more powerful than a fourth; altogether a man of real and fine attainment, a master in full and calm possession of his means. He knows his art, and himself also. It might be said that, beginning as an ordinary practitioner in the British school of sculpture, he rose by mental superiority to be a leading personage in the European school: and the same remark would to a great extent hold good of his predecessor Baily, whose lengthened career, however, closed before he had achieved coequal distinction. The death of Mr. Foley is truly a mischance to our sculpture, and leaves a conspicuous gap among the Royal Academicians: they may, nevertheless, if they please, so far recoup their loss as to substitute one excellent sculptor for another, and elect Mr. Woolner as a worthy successor to Mr. Foley.

W. M. ROSSETTI.

CAMBRIAN ARCHAEOLOGICAL SOCIETY.

LAST week the members of this Society held a series of meetings, of which Wrexham was the headquarters. On Monday, August 24, the Society met in the Public Hall at Wrexham, to hear the report for the past year read by the Rev. E. L. Barnwell, one of the secretaries of the Association, whose account of the state of the Society was very satisfactory. In moving the adoption of the report, Professor Babington congratulated his colleagues on the better preservation of local antiquities: some years ago it was common for farmers to break up monumental stones to mend their walls; but at the present day the interest in such remains was more widely diffused. A paper was then read by the Rev. D. R. Thomas on "The Archaeology of Wrexham and the Neighbourhood," in which he gave a sketch of the geological formations of the district, and then passed on to speak of the history of the inhabitants. The Welsh families were of undoubted antiquity; for to the ques-

"When Adam delyed and Eve span,
Who was then the gentleman?"

the time-honoured and authentic answer had been given—

"Eytton of Eytton and Jones of Llwynnau,
They then were gentlemen."

Descending to more historic times, traces of the Roman occupation were still visible in the remains of their mines at Shinders Oerion, near Caerwrlle, and in some of the names in the district. Intimately connected with the Roman occupation was the great monastery at Bangor, whose inmates were concerned in the controversy between St. Augustine and the British church; and Mr. Thomas suggested that the slaughter of the monks by Ethelfrid of Northumbria might have occurred at Pant yr Ochain, "the dingle of groaning." This event was followed by the war between Oswald and Penda, and the consequent annexation of the district to the kingdom of Mercia. After a few remarks on the building of Offa's dyke and the invasion of the Danes, who were defeated by the inhabitants at Bullington, the lecturer proceeded to speak of the churches, which were originally built of "wattle and dab," "a specimen of which still existed in the curious little church of Melverley, near Oswestry," and hoped that more information would be obtained about their own parish church, one of the finest in Wales, which a former bishop had desired to erect into a cathedral.

On Tuesday the members of the Society paid a visit to Chirk Castle, the seat of Mr. Biddulph. The chapel and other portions of the building are of the fourteenth century. In the picture gallery there is one of the finest portraits extant of the Duke of Monmouth; and the collection of armour includes twenty or thirty muskets of the reign of Charles I., of which there are few, if any, specimens in the Tower of London. The party then went to Ruabon Church, where the Rev. E. D. Edwards exhibited a fresco lately discovered on the south wall, which was probably executed by the monks of Valle Crucis in the thirteenth century. Mr. Whalley, M.P., one of the churchwardens, produced a monumental effigy connected with the church, which he believed to be of the sixteenth century, but the more skilled archaeologists present attributed it in preference to the fourteenth. Luncheon was hospitably provided by Sir W. W. Wynn at Wynnistay, and the house, which is modern, was exhibited by Mr. Ferrey, son of the architect.

In the afternoon, Offa's dyke, Penygardden, and the adjacent earthworks, were visited; and in the evening a meeting was held at Wrexham, at which Mr. Bloxam contributed a paper on the history of Chirk Castle.

On Wednesday the Society visited Chester. An address was delivered in the Cathedral by Deau Howson, who gave an account of the re-

storation now in progress, for which more money is required, although 60,000*l.* has been already spent. The Society promised 50*l.* for the restoration of a stall in the choir. St. John's church, the Phoenix tower, and other interesting portions of the city, were also inspected, as well as the Museum of the Chester Archaeological Society.

On Thursday, a number of ladies and gentlemen drove to Hawarden Castle, a modern building, but containing within its grounds the ruins of a British castle, which is mentioned as existing in 790, when Offa, King of Mercia, built his famous dyke.

On Friday, the parish church of Wrexham was examined. The range of arches and pillars in the middle of the church was probably built in the fourteenth century, and the aisles, clerestory, and tower subsequently added. The exterior is of the style used in the reign of Henry VII. Among the sculptures on the tower is a figure of St. James of Compostella, with a scrip and bourdon and the other usual accompaniments; and a curious group of a sow and litter of pigs, which perhaps refers to some local legend. In the chancel is an effigy of Hugh Bellot, who was Bishop of Bangor from 1585 to 1595, when he was translated to the See of Chester, and died the following year. The font is ancient, having been displaced during the civil war, and used successively as a pig-trough and a flower-pot; but is not improved by having been recently re-chiselled.

During the week a collection of objects of interest was exhibited in the Public Hall. These were lent by gentlemen and ladies residing in the neighbourhood, and included rare editions of the Bible and other books, principally relating to Wales; portraits of Charles I. and the Chevalier St. George; a shoe belonging to one of Cromwell's horses, armour, old china; Ashantee, Abyssinian and South Sea Island weapons and ornaments; Roman and Samian ware and coins dug up in Chester; a copper drinking cup weighing 6*½* lb., which each burgess of Holt was obliged to empty on his enrolment, a task which is now commuted for a fine of 10*s.*; and many other curiosities of all kinds.

SPURIOUS HEBREW COINS.

SOMEWHAT too late, we fear, to be of full service, we call attention to a recent "find" of silver coins in Palestine which cannot have formed a portion of any genuine coinage. These pieces, some of which have been sold in high quarters at high prices, bear the impress of antiquity in their types and legends. They are all specimens of the stater, or three-quarter shekel—a coin which, during the Roman domination, was accepted by the Sanhedrim in lieu of the legal shekel for the purpose of the Temple tax. There are two types of the first year of the Sabbatic week, five of the second, two of the third, and four of the fourth, none of which exactly coincide with any of those heretofore figured. The letters are of a very ancient form, and there is one of them on one coin, a mim, which has a sort of *jerret*, or cross, on the tail, that has not been previously observed. The type is that of the *cos*, or sacrificial goblet, on the obverse, and the three-flowered rod on the reverse, with the legends "Jerusalem the Holy" and "Shekel Isral."

Thus far all is well. But the careful observer will be struck by the following peculiarities:—The coins appear to have been exposed to great violence of heat, but show no signs whatever of wear. Some of them are coated with a hard, nearly black, incrustation, which is not the horn silver, dear to the collector, but resembles a lead slag. File marks on the edges are sharper and less careful than in the few accepted specimens of this curious kind of coin. The surface, instead of that lovely *patina* which covers the unique British Museum specimen of a half-stater, has a hard, dark appearance, such as is produced in an alloy of silver and lead by the less precious metal.

One of them, which seemed to have been tested by the file, showed specks and bubbles that denoted that the metal had been not stamped, but cast. Finally, and conclusively, the specific gravity of a tested specimen was 10.8; which is that of an alloy of two-thirds of silver with one-third of lead; the specific gravity of the English silver coinage being, as is well known, 10.35, and that of the French coinage being 10.33.

It is, of course, possible that these base pieces were issued during that fiscal revolt of the Jews (about A.D. 135, according to general accounts, but concluded in A.D. 122, according to the Talmud), which plays so disproportionate a part in the numismatic theory of De Saulcy and his followers. But although the baseness of the metal, and possibly even the use of the cupola instead of the die, might be thus explained, the absence of wear, and the presence of the peculiar incrustation, in which one or two of the specimens are so encased as to be indistinguishable as to type, can hardly be thus accounted for. That at some time or other these pieces have been cast, either on old matrices or on moulds made from genuine coins, may, we think, be frankly accepted. *When* this forgery was made, whether seventeen centuries or seventeen months ago, there is little to show, except the absence of true *patina* and of marks of wear.

We cannot too forcibly impress on all collectors of coins of so rare a character, the necessity of having recourse to the sure test of the balance. De Saulcy has set the good example, not followed by his English disciples, of stating the weight of each silver piece which he figures. Of the copper coins he has not given the weights. The statement is made that the results of weighing the copper coinage are so anomalous, that the only effect of publishing them would be to overthrow existing theories on the subject. If that be the case, such theories ought to be overthrown, and will be exploded sooner or later. The careful toil of the Abbé Barthélemy is that which should be taken as the model by the numismatist. In all branches of research it has been from the facts which at first appeared most anomalous that the greatest light has been derived. And justly so; for anomalous, in such a case, simply means something not commonly known, or not known to the particular student. If not only the investigation of weight, but that of specific gravity, were made an essential part of the description of every coin, the speculator would find it impossible to sell bad alloy for genuine silver.

NOTES AND NEWS.

A CONSPICUOUS and very ugly stone obelisk has just been erected at Greenwich Hospital, in the grounds immediately opposite the Ship Hotel. It is dedicated to the memory of the brave men who fell during the war in New Zealand in 1863-4, by their surviving comrades of Her Majesty's ships *Curaçoa*, *Miranda*, *Harrier*, *Esk*, and *Eclipse*. In the centre are the words "New Zealand," and on the four sides the names and rank of those whom it commemorates.

THE death is announced of Mr. Thomas Carrick, the portrait painter. His portraits of various political and other celebrities are well known from having been exhibited in most of the popular print shops. Mr. Carrick was a self-made man and self-taught artist. He was born at Carlisle.

MISS LEECH has kindly lent her private collection of her brother's original drawings to the Brighton Pavilion Committee for the purpose of exhibition.

A STATUE is to be erected in Glasgow to the memory of Livingstone. The balance of the Livingstone Relief Fund—about 500*l.*—is to be devoted to this purpose, and other funds raised by subscription.

A FINE collection of engravings from the works

of Wouvermans may now be seen in the passage from Guildhall to the City Library. They have been presented by Mr. Nissen.

A COMMITTEE has been formed at Venice for the purpose of erecting a statue to Nicolo Tommaseo, who was the colleague of Manin during the provisional Government at Venice in 1848.

THE *Chronique*, as a warning to conservators of museums, states that a thief has recently found means of cutting a painting out of its frame in the Marseilles Museum and making off with his booty.

M. FLAMENG's fine etching of Rembrandt's *Night-Watch* may be obtained from M. Lévy, 21, Rue Bonaparte. The finest proofs on parchment cost 300 fr., proofs before letters 100 fr., and ordinary impressions 40 fr.

DOUBLEMARD, the sculptor, is engaged at Paris on a statue of Bolivar the "Liberador," which is to cost 3,200l. The model is about to be sent out to Guayaquil for the approval of the Ecuador Government.

THE Cercle Artistique et Littéraire of Brussels will open an exhibition of the works of its members in November. A large new gallery has lately been added to the "grande salle" of the Cercle, which will then be inaugurated. The Cercle Artistique et Littéraire is about the most flourishing of all the art societies of Brussels.

A NATIONAL Kaulbach Institution has been founded at Nürnberg to give assistance to talented German artists, without distinction of age, sex, or place of residence. The council is composed of artists and lovers of art (*Kunstfreunde*), and the committee have already received powerful support, especially from Germans residing in foreign countries. The annual contribution to the foundation is fixed at two Reichsmark.

AN interesting account of the young Spanish painter Fortuny will be found in the *Zeitschrift für Bildende Kunst* of August 21. Théophile Gautier gave a short sketch of Fortuny's artistic life in the *Journal Officiel* some few years ago, and the present writer on the subject adds a few particulars gleaned from Fortuny's friends in Rome. The value of the article is increased by a capital woodcut from a pen-and-ink drawing by Fortuny—a most life-like sketch of a man seated on a rude bench and leaning on a stick. The other articles of the number are a continuation of Dr. Woltmann's "Excursions in Alsace," giving the history of the Minster at Strassburg, a review of Rudolf Rahn's *History of Art in Switzerland*, and a further account of Goethe's relations with the Saxon Art-Union, contributed by Hermann Uhde. Several long letters from Goethe are given, but they have not much interest.

An etching, by E. Forberg, of a picture in the Royal Academy at Vienna, attributed to Bonifazio, forms the frontispiece of the number.

THE great wooden gallery that runs along the façade of the Luxembourg, below the Pavillon de l'Horloge, is being heightened and enlarged. It has hitherto contained only the portraits of the members of the Institute, but its enlargement will now permit of the exhibition of a great many pictures that have been stowed away for want of room.

THE inauguration of the monument at the Ecole des Beaux-Arts to Henri Regnault and his comrades who fell in the late war, will take place on October 5.

AN important painting, by Rubens, of *The Judgment of Solomon*, will, it is announced, be put up to auction at the Hôtel Drouot during the forthcoming season. That this picture should be "still in a good state of preservation" is remarkable, considering the sufferings it has undergone, and the hair-breadth escapes it has had. In 1832, during the siege of Antwerp, *The Judgment of Solomon* (then in the Antwerp Museum) was struck by a projectile, and so badly wounded that a picture restorer demanded 1,500 fr. for his attention

to the case. After he had performed a cure, the restored Solomon was bought by M. Hercule Robert, a distinguished amateur, who possessed a fine gallery in Paris. But unfortunately, M. Robert's hôtel, which was situated at the angle of the Quai Saint-Paul and the Rue de l'Etoile, suffered greatly during the days of June, 1848. No fewer than eleven cannon balls were thrown into it; and one of them struck Rubens' painting exactly in the same place as the projectile at Antwerp. This second wound, however, was also skilfully healed, and Solomon is now reported to look as young and fresh as ever. The painter has depicted himself and his beautiful young wife, Helena Fourment, in this work.

OF late years attention has been drawn among Germans and Russians to the specialties which distinguish the industrial art-products of many tribes of Eastern Europe, more especially the South-Slaves who inhabit the shores of the Lower Danube. Here it would appear that the woollen and linen fabrics of their rude looms, and their embroidered cloths, which have been made after the same patterns for ages, possess a genuine artistic character in their designs and combinations of colour approximating very closely to primitive Oriental art. After long ages of neglect and contempt, the Germans are beginning in the present day to see the benefit that their own textile art may derive from copying the characteristic excellences of the relics of a primitive industry which the advance of Western civilisation is rapidly blotting out. Herr Essenwein and F. Bock have the merit of having been the first to recognise and draw attention to the scientific and artistic value of the brightly-coloured carpets, rugs, and borders, and the excellent embroideries on linen which were produced among the semi-barbarous Slavonic tribes who so long seemed to form the boundary line between Eastern and Western civilisation. The Technological Museum of Vienna now possesses some good specimens of these products, but the best collection of the kind is that of Herr Felix Ley, at Esseg, which was shown at the Paris Exhibition of 1867, and there attracted the attention of Professor Friedrich Fischbach, of Hanau, who, detecting the advantages which such models would afford to manufacturers, both in regard to designs for ornamental metallic working and for textile fabrics, procured the consent of the owner to have coloured plates taken of the most characteristic of these objects. The result of his efforts is an interesting work, entitled *Südslavische Ornamente* (Hanau, 1874), which is illustrated by seventeen admirable plates, and as a pendant to this, Professor Fischbach is preparing a work on the national art industry of Hungary. The St. Petersburg press has also recently issued a volume, which, under the title *L'Ornement Russe National*, treats of Slavonic embroidery and lace work, and thus, like the other books to which we have referred, supplies a want in industrial art literature.

IN Hubert Janitschek's article on German Art and German Artists in Rome, in *Unsere Zeit* for August 15, the author goes out of his way to speak of a young Norwegian sculptor, Daas Magelsen, who is, it appears, on the high road to a reputation of the same kind as Thorwaldsen's. He lived here in England in great destitution, cutting out models of ships for a livelihood, but his genius became slowly appreciated by his countrymen, and he was enabled to go to Rome to study. Janitschek praises a *Meleager* as particularly passionate in feeling and noble in outline, and mentions an excellent portrait of Ole Bull, the violinist.

THE collections of signet rings, seals, weapons, and armoury which had been made by the late Dr. B. J. Römer in the neighbourhood of Frankfurt am Main, has passed into the possession of Count Solms-Rödelheim. The acquisition by the Count of these interesting antiquarian objects has been hailed with much satisfaction in the neighbourhood, since it was feared that in default of a

purchaser nearer home this unique collection would make its way, like so many other art treasures, to England. The value and interest attaching to the collection are enhanced by the fact of its having given origin to the learned work on the "Seals of the emperors, kings, and self-styled kings of Germany," brought out by Dr. Römer in 1851.

A REMARKABLE find has been made in Nideggen Castle, the hereditary seat of the dukes of Jülich, where Archbishop Engelbert of Cologne was kept prisoner for some time, but which is at present only a ruin. The present proprietors have given instructions to have the well in the castle-yard cleared out. This well, according to old chronicles, is supposed to have a depth of 550 feet, and is said to extend to the bed of the river Roer. After clearing out large masses of debris, the workmen came, ninety-five feet under the present level, upon a large number of Jülich gold and silver coins, which were probably thrown into the well at the time of the storming of the castle by the Emperor Charles V. But the most interesting find was made a short time after, when a well-preserved cross-bow was brought up, inlaid with ivory and decorated with gold. At the butt end is a beautiful Gothic W inlaid in gold, with a crown and the number II above it, which leads to the supposition that the cross-bow, a most singular specimen of its kind, belonged to William II., Duke of Jülich. Helmets, heavy clubs with spikes, and several long knights' swords, partly attacked by rust, were also brought up. The several objects found will, as soon as the other excavations which have been ordered in other parts of the ruins are completed, be forwarded to Aix-la-Chapelle; the cross-bow, however, will be sent to Berlin, Duke William being an ancestor of the German Emperor.

THE STAGE.

"AMY ROBSART" AT DRURY LANE THEATRE.

IT is pleasant to see a large theatre filled from footlights to chandelier with enthusiastic students of English history, as presented in Mr. Andrew Halliday's cheap illustrated edition. It is agreeable to notice the approval with which they view both the heroic and unheroic deeds of past times; and the cheers which they bestow on queens and merry-andrews, on ministers of State and drunken senators, on screaming maidens and sleek villains. This impartial attitude is invaluable to the proper study of history. Mr. Halliday knows it, and makes use of it. His procedure is extremely simple. Sir Walter Scott had an inexhaustible talent for scenic effect, and employed that talent in writing historical romances. Mr. Halliday sets to work on Scott's pictorial ideas. Mr. Beverly provides them with illustrations; Mr. Halliday with letter-press. Mr. Beverly gives them a local habitation; Mr. Halliday a name. And the dramatist brings to his task a thorough knowledge of the modern science of the boards. It is a science which Byron disdained, and which Shakespeare lived too soon to understand. It causes managers to look askance on Manfred, and banishes Hamlet to the limbo of English operas at the Crystal Palace. But Mr. Halliday has studied it profoundly. He is marvellously versed in exits and entrances, in well-timed curses and looks of scorn, in brawls which shall drown the noise of workmen's hammers, in arrivals on state-barges and departures through trap-doors. This skill is conspicuously shown in *Amy Robsart*, lately revived at Drury Lane Theatre, in which, with the aid of a large number of officials, including the gasman and the prompter, whose names are all very properly placed in the bills, he has given a most creditable representation of England in the days of Elizabeth.

There is no period so well adapted to theatrical reproduction. It is the most highly coloured epoch of English history. In the transition from feudal to court life men's brains overflowed with

living forms. They found vent in the stage, in shows and pageants, masques and mythological entertainments, processions and dramatic receptions. All was extravagance. The men wore busks and verdugales: the women wore cambric ruffs and jewelled stomachers. In their speech they ran into far-fetched conceits, and played fantastically with words. The age would do nothing like other ages. Art had lately produced Titian and Correggio: the drama now gave birth to Shakespeare. Three hundred years pass, and the ideal changes. Art produces a Beverly and the drama a Halliday. The playgoer is to be humanised. He shall not again see Tamerlane riding in a chariot drawn by chained kings, Giovanni entering the banquetting-hall with his mistress's heart on his dagger, the Duchess of Malfi going slowly mad in the sight of the people. Daintier sights shall be set before him: queens gracefully descending from well-trained horses, gracefully stepping upon well-lined cloaks, gracefully departing in well-oiled barges. His passions are to be greatly stirred. The queen will now and again condescend to drag unhappy maidens about the stage, will throw them on the ground, will reproach them in vehement language. There shall be no stabbings and drownings and the like horrors; but merely a drawbridge, a bolt, and a moat underneath. And if with all this the spectator's aesthetic sense is not gratified, he must be a very ill-conditioned playgoer indeed.

Miss Wallis is remarkably intense as the heroine, Amy Robsart. She flashes defiance at Varney with all her features. She thinks to overwhelm him with clamour. She screams when he approaches her, screams when he leaves her, screams when he drags her up the steps of Mervyn Tower, screams when he falls through the drawbridge. But Mr. Creswick, as Richard Varney, stands undaunted in the midst of the confusion. He is the smoothest villain in all the annals of villany. The cries and menaces of Amy Robsart glide off him easily and naturally. Mr. Creswick is somewhat given to unmeaning action with his hands, but he is an excellent artist. It is to be regretted that actors are employed at all in plays of this class. Machinery is making such strides that the day cannot be distant when Miss Wallis's screams will be performed by a steam whistle and Mr. Creswick's gestures by a self-working pump-handle. Meanwhile it is necessary to say that the actors who are at present engaged gave much satisfaction, and if it be seemly to distinguish between them we may select for special praise the yeomen of the guard who wore their courting-caps with great dignity, and the queen's white horse who carried his royal mistress so gallantly that he was received with unusual applause.

"THE BROKEN BRANCH" AT THE OPERA COMIQUE THEATRE.

LIGHT opera has become an integral part of the modern stage. It is not, indeed, congenial to minds of severe calibre. Even the grand opera was long ago written down among the unveracities by Mr. Carlyle. But the classes whom it attracts to the theatre are very numerous, and include a large number of educated men. When the company from the Fantaisies Parisiennes of Brussels were singing the music of M. Lecocq's latest production it was by no means rare to see distinguished politicians, men of letters, and men of science unbending themselves in the stalls. The taste is not depraved, and the relaxation afforded to the mind by light music is infinitely more agreeable than that afforded by the sight of ships sinking into dusty waves, and by the splitting of wooden icebergs. But Mr. R. D'Oyly Carte is not concerned with the ethics of opera-bouffe: he merely regards it from a financial aspect, and finds the prospect pleasing. He has therefore established a permanent home for it at the above-named theatre, and has selected for his first venture a piece which met with success in Paris a little time ago. It has been adapted into ex-

cellent prose and verse by Mr. Du Terreaux, and the music is written by M. Gaston Serpette, a prizeman of the Paris Conservatory. It is constructed on the usual model of these productions, with a lover's part for M^{me}. Peschard and a hoyden's part for M^{me}. Judic. It would be difficult to count the number of mimic husbands who have been sent to fight the Saracens, of magic distaffs which have been broken, of silver cups which have been lost, through the sympathy existing between M^{me}. Peschard and M^{me}. Judic. But the Parisian public loves to see these actresses bill and coo, and Parisian authors and musicians generally love what the public loves. M. Serpette's opera is quite the best of these pieces written to order. Its story is sufficiently clear and more than sufficiently extravagant. It possesses no humour except a little of the pantomimic or slap-on-the-back order. But the music is very graceful, M^{lle}. Rita's singing the best thing of its kind ever heard in London, and the decorations and costumes unusually brilliant.

The story is compiled from various sources, and owes not a little to Scarron. It was a maxim of Roman law that a woman was the beginning and end of her own family. It was also a maxim of the House of Buhtvarnich. In both cases the females were the broken twigs of the family tree. In both cases the maxim was grounded on tradition, but in the former it was a useful fiction, in the latter a disagreeable reality. Hereditary instinct was strong in the niece of the Grand Duke, and led her to run away from a convent and from her betrothed husband, Prince Isidor, and to join a company of strolling actors, in the ranks of which the prince had also enlisted to escape from his affianced bride. Of course two rustic lovers, the Peschard and Judic of the story, are found to replace them. Of course their names are Jean and Margotte: and of course Margotte is saluted as princess. But she did not proceed to retrieve the honour of the family: and she was not warned by the pictures which hung on the palace walls, of faded damsels who had broken as much of the family tree as their personal appearance would allow them. On the contrary, she demoralised the court. Though a simple village maiden, she had learned to dance the cancan as wildly as a dishevelled milliner of the Quartier-Latin. It is true that her country was Germany and the age mediæval: but the cancan is of no country and of no age. So the ministers of state and maids of honour, the gentlemen ushers and kitchen wenches, the master of ceremonies and prima-donna of the court, were initiated into the mysteries of a Parisian orgie, and held their own gallantly. The ladies abandoned their flowing robes and appeared in thinnest gauze. And it is perhaps due to the intervention of the new licenser of plays that the piece is brought to a speedy termination by the return of the true prince and princess.

It will be seen that there is little fun in the story, and yet the opera is thoroughly successful. For this the music of M. Serpette is entitled to much credit. It is the music of a young composer who has studied in a good school, but who has not allowed his fancy to run away with him. It cannot be very popular. The humour of Offenbach, and the grotesqueness of Hervé, are wanting to it; but it is distinguished by delicacy of feeling and daintiness of thought. M^{lle}. Pauline Rita and Miss Laverne pour out their sorrows in a duet, which is at one quaint and original. And this brings us to the remark that no branch of the drama has of late received so valuable an addition as light opera has received in M^{lle}. Pauline Rita. Her voice is sweet and her method perfect. She has evidently been trained for a higher stage. She has stooped to conquer. The refinement of her style is set in relief by the boisterous manner of Miss Laverne, who sings nautical ballads and dances Parisian quadrilles with the utmost vivacity. Altogether Mr. Carte may be congratulated on the success of his entertainment.

WALTER MACLEANE.

M^{me}. ANGOT and her daughter have once more returned to enliven the town. The fops with their black cravats and *cadettes relevées*; the ladies with their buffonets and shovel bonnets; Barras the statesman and Lange the actress; Anre Pitou the agitator and Larivaudière the stock-jobber; all the world of intriguers and gossips, of rascals and dissolute women, that was centred in Paris under the Directory, is once more represented on the London stage. At present it finds place at the Lyceum and Standard Theatres. At the former it is ably directed by Miss Emily Soldene; at the latter by Miss Julia Matthews. There is no reason why these companies should not join forces, and establish a theatre for the performance of the opera for ever.

MR. ARTHUR OCEIL made his appearance on Wednesday at the Gaiety Theatre in Mr. Arthur Sullivan's operetta *Cox and Box*. Mr. Cecil is at his best in music of a humorous vein. He sings lullaby to the bacon with deep feeling, and relates with genuine emotion his flight from the renowned mistress of bathing-machines. But it is to be hoped that he will soon have an opportunity of showing the full range of his comic powers. Meanwhile the Gaiety programme is flanked by the *Princess of Trebizond*.

SEVERAL new pieces are expected in London. Drury Lane Theatre will in three weeks produce Mr. Halliday's play, *Richard Cœur de Lion*, in which Mr. Creswick and Miss Wallis perform the chief parts. At the Haymarket Theatre M^{lle}. Beatrice appears to-night in M^{lle}. Desclée's great part in *Frou Frou*; and she will revive on Saturday, September 19, the English version of Sardou's *Nos Intimes*. The Olympic Theatre will shortly produce an adaptation of M^m. D'Ennery and Cormon's latest drama *Les Deux Orphelines*. The Gaiety Theatre has in rehearsal a version of M. Lecocq's *Les Cent Vierges* and a comic opera by Johann Strauss. The Princess's Theatre will revive on Thursday next Mr. Watts Phillips' drama *Lost in London*. The Strand Theatre is preparing another farcical piece by Mr. Farnie, to be called *Loo*. The Alhambra Theatre produces on Monday next an opera-bouffe translated by Mr. Byron from a libretto written by M^m. Vanloo and Leterrier, and fitted with music by M. Georges Jacobi, the conductor of the theatre. And, finally, the Charing Cross Theatre opens on Saturday, September 19, under the management of Mr. W. R. Field, for the performances of Miss Lydia Thompson. A comedy by Mr. Burnand, said to be an adaptation of *Gavaut, Minard et Cie.*, and an extravaganza by Mr. Farnie, said to be called *Blue Beard*, will be then produced.

SARDOU's play, *Les Ganaches*, was revived at the Théâtre du Vaudeville, Paris, on Tuesday. The Bouffes Parisiens opened on Wednesday with *La Jolie Parfumeuse*, M^{me}. Judic appearing in the part of M^{me}. Théo. Two new pieces have been performed in Paris: one at the Théâtre du Château d'Eau, by M^m. Clairville and Marot, called *Le Treizième Coup de Minuit*; the other at the Théâtre des Variétés, called *Les Mormons à Paris*, by M^m. Delacour and Louis Leroy.

GEORGE SAND has written a comedy called *L'Homme de Neige*. Victor Sejour's *Cromwell* is in rehearsal at the Théâtre de l'Ambigu. The piece by M^m. Lecocq and Sardou, called *Les Prés-Saint-Gervais*, has been read to the artists of the Théâtre des Variétés, and the principal parts assigned to M. Dupuis, M^{me}. Z. Bouffar, and M^{me}. Paola Marié. The autumn and winter seasons at Paris will see many other novelties, of which we will shortly give a list.

THE members of the Academical Theatrical Society of Berlin have unanimously resolved to assume for the association the name of "Akademisch-literarischer Verein." Prince George is still its patron, and in an autograph letter to the president has signified his approval of the change of name, because the new title is more in keeping with the objects and tendencies of the society.

According to a Prague journal, the tragedian Rossi is applying himself closely to the acquisition of the German language. He has already made such progress that he will probably make a professional tour through the whole of Germany next year, in order to interpret Shakespeare, Schiller, and Goethe to the Germans in their own language.

MR. BOETTICHAULT has prepared a piece for Booth's Theatre at New York, founded upon incidents in the late American rebellion, and has gone over to superintend its bringing out.

MUSIC.

THE Gloucester Musical Festival, some particulars concerning which were given in the ACADEMY of August 15, commences on Tuesday next, and will be continued daily till Friday.

M. OFFENBACH is engaged to write a grand opera bouffe in three acts especially for this country, which is to be produced at Christmas in one of our chief London theatres. The subject is to be "Whittington and his Cat," and the libretto will be from the pen of Mr. H. B. Farnie.

MME. ILMA DE MURSKA has commenced an operatic engagement at Pesth as Lucia, with great success, being recalled a dozen times in the course of her performance.

MME. DÉSIREE ARTÔR, and her husband Signor Padilla, are about during the coming season to make a professional tour through Russian Poland, Denmark, Sweden, and Norway.

THE young and talented Dutch musician, Herr J. Kwast, has been appointed to the professorship in the Cologne Conservatorium rendered vacant by the resignation of Herr Gernsheim.

HERR EDUARD MANTJES, once one of the chief ornaments of the Berlin Opera, died at Ilmenau on July 4, at the age of sixty-eight. Herr Mantjes retired from the stage in 1857.

Über Land und Meer states that Mde. Adelina Patti (the Marquise de Caux) will not star in Paris in the coming winter. She is again engaged for the Italian Opera in St. Petersburg and Moscow, where she will enjoy considerably higher salaries than ever before.

IN Christiania the foundation has been laid of a monument to the Norwegian composer, Halfdan Kjerulf. The bust, which has been cast by the sculptor Bissen in Copenhagen, will be unveiled on September 15.

THE little pavilion in the garden of the Freihaus, in one of the parts of Vienna called Wieden, which belonged to the Prince Harberg, was always one of the first places which the music-loving visitor to the great Austrian metropolis inspected. It is known as a fact that in this little wooden house, which has of late years been in a state of decay, Mozart wrote his masterwork *Die Zauberflöte*. Last spring Prince Harberg presented the "magic" pavilion to the "Mozarteum" in Salzburg (for the benefit of which Adelina Patti lately gave a concert), in order that this sacred relic may be preserved. The pavilion has now been transferred to Salzburg, where the aldermen found a place for it in the Mirabellen-Garden. This place was enclosed by a gilt gate, and called "Mozartheim." But afterwards it was found that the memorable little house was too little "monumental" in itself for its situation, and that it was in a too far advanced state of decay to be left in the open air without protection. So at one of the last meetings, Dr. Oscar Berggrün, one of the members of the committee, who has been already mentioned in this paper, proposed to build a little house wherein the pavilion is to be preserved. In consideration of the subject of the great work whose cradle the little pavilion was, he proposed that the house should be rebuilt as an Egyptian temple, and the pavilion should take

therein the place of an "altar"—a sacred altar indeed for every musician and lover of music. This proposal was unanimously accepted, and the temple is now being built, after the sketches which Dr. Berggrün brought himself from Egypt, where he spent nearly all last winter and spring. Several Salzburg amateurs have subscribed for the expenses of building, in order that the Mozart Fund may be spared. In the *Zauberflöte* pavilion itself, on the very table on which this marvellous opera was written, there will be a large album, and all the great musicians, poets, and critics of all nations will be invited to send their photograph, with a few lines, to this album. Among those which have already arrived, there is one remarkable, that by Herr Emanuel Geibel, one of the most prominent lyric poets of our century. It runs thus:—

"Mag die Welt vom einfach Schönen
Sich für kurze Zeit entöhnen,
Nimmer trägt Sie's auf die Dauer
Schnöder Unnatur zu fröhnen.
Zu dem Gipfel treibt sie heimwärts
Den die echten Lorleern Krönen
Und mit Wonne lauscht sie wieder
Gothe's Liedern, Mozart's Tönen."

Several prominent English musicians have already been asked to send their portraits and autographs.

VERDI's new opera *Julius Caesar* will be produced during this season in Paris and several towns in Italy.

MR. DEXTER SMITH publishes in the *American Review* a letter which he says he has received from Richard Wagner, and in which the writer complains that the Bayreuth enterprise has not only met with much opposition among the German public, but also that the whole German press has been aroused against it. The letter is written in that arrogant style which made the great composer "one of the best hated men of his period." *The Neue Freie Presse*, reprinting that letter, remarks:—

"This letter contains so many invectives against Germany, its musicians, and those who came willing to make every sacrifice after the first appeal from Bayreuth, that we should be glad to hear that it comes only from the pen of a sensational American reporter. It will be Richard Wagner's duty to disavow, if he can, this letter, which might prove injurious to himself and his enterprise."

GUSTAVE HOLZEL's new song, "Geduld der Knospe," which he has written for Adelina Patti, has been bought by Schott und Sohne for 500 gulden (45*l.*), and will be published with English and German words.

THE Vienna "Männergesang-Verein" gave a great concert, on the 25th ult., at the Teatro Fenice, and excited the greatest enthusiasm. Schubert's "Gondolieri," Weinurm's Italienisches Volkslied, and Abt's "Vineta," were encored. Great ovations were offered to the conductors, Herren Kremsler and Weinurm, and the president, Dr. Olschbuer. In the evening the society was invited by the "Societa Allemanna," and on the 25th, a great Liedertafel was given on the Laguna.

THE opening of the New Opera at Paris is fixed for January 1; but the number of workmen employed is insufficient for the work, and it is to be hoped the Government will use every exertion for its completion. M. Halanzier will be ready before the appointed time: the decorations and costumes are executed on a large scale, and *Hamlet*, *La Juive*, and *Faust*, will be ready for the rehearsals in October. The orchestra, the choruses, and the ballet will then be completed. Mde. Nilsson visited the opera a week or two ago to try the acoustic merits of the new building, and the result was most satisfactory, though, with the scaffolding, and the absence of flooring, it was impossible to judge how far the voice would travel. Mlle. Krauss is also expected this week to make a similar trial.

POSTSCRIPT.

DR. EMIL BESSELS has addressed a letter to the *Allgemeine Zeitung* from the Smithsonian Institute at Washington, in which he explains at length the reasons which led to the return of the *Polaris* expedition before the appointed time, and when it had only reached 83° N. lat. He asserts that the death of Captain Hall in no way influenced the survivors in their decision to return without having accomplished the main object of the expedition, but that, on the contrary, the result must have been precisely the same had he lived, since the *Polaris* had sprung a leak twelve feet below the water line, which it was found impossible to stop, while her position was rendered most dangerous by the continual pressure against her side of the great iceberg which lay between her and the shore. When towards the end of the winter the N.E. storms began to set the ice in motion, the *Polaris* was driven helplessly out towards the sea, at the very time that it was necessary to work the pumps almost incessantly. As this could only be effectually done by the aid of steam, the coal-supplies rapidly diminished, and under these circumstances the officers in command of the ship, after the death of Captain Hall, had no alternative but to return; to have persevered would simply have been to incur certain destruction. In regard to the opinion expressed by some American papers that the officers of the *Polaris* should have tried to advance northward in sledges, Dr. Bessels states that the sea-ice was in constant motion, owing to the mildness of the season, and was so rough and uneven that there was not more than a couple of square miles of smooth ice over the entire area of Robeson's Channel. Violent storms prevailed, moreover, all the winter in the ratio of 75 per cent. of the entire period, and carried the snow off the land in sudden squalls, heaping it up at some spots in huge drifts, and leaving the ground denuded at other places and unfit for sledges. Dr. Bessels draws attention to the numerous incidental and uncontrollable causes on which the success of Arctic expeditions must always depend, and he points out how little the courage and endurance of the bravest and most determined explorers can influence the result of such enterprises.

LITERATURE.

Supernatural Religion: an Inquiry into the Reality of Divine Revelation. In Two Volumes. (London: Longmans & Co., 1874.)

Ditto, Second Edition. 1874.

(First Notice.)

It may be hoped that the author of this brilliant and disappointing book has learnt from its rapidly gained popularity how gratuitous it was to defy obloquy on account of his spirit of free enquiry, and conscientious love of truth. His readers, on the other hand, have gained less than they may have hoped from the opportunity afforded him by "the issue of a second edition to revise the work." Of course, the enormous crowds of *errata* have been corrected in the text, and smaller supplementary lists added (which are not yet quite sufficient); but the character of the book is what it was before, except that what looked like promise in it seems likelier to be the limit of ultimate performance. It abounds with acuteness, it overflows with reading: except "intelligence," in Goethe and Matthew Arnold's sense, it has every characteristic of a first-rate book; indeed, perhaps it would be one, except that it is not a book at all. At the conclusion of two good-sized volumes, this fact seems to have dawned upon the author, and he intimates that a continuation is to be expected; his readers will look for it with interest, and with the hope that it may bear to the present "section" the relation of a digest rather than of a sequel.

As the work stands at present, it is divided into three parts, of very unequal length and merit, the shortest and least satisfactory being that which is really about the subject proposed in the title, and to which the additions, the more considerable retrenchments, and the extensive but not very important rearrangements, of the new edition are entirely confined. The Introduction, Part I., on "Miracles," and the last chapter, entitled "Conclusions," are an acute, intelligent, but withal somewhat captious statement of the common *à priori* arguments against any supernatural revelation whatever. A sentence or two at the end of Part I. introduces us to an examination—not as promised, of "the date and authenticity of the literary evidence for miracles," but of the literary evidence for the date and authenticity of our four canonical Gospels; and Part II., which deals with this question so far as concerns "the Synoptic Gospels," must, with some reservations, be accounted a really masterly contribution to the literature of the subject. Part III., on "the Fourth Gospel," is less satisfactory: it seems to have been added for the sake of symmetry in a rather perfunctory temper: whereas the question of authorship is bound up in

this case far more closely than in the others with that of authenticity, and ought to have received proportionately fuller treatment. Then, to make the critical portion of the work really complete, we ought to have had two more parts—one dealing with the historical and evidential significance of the Pauline Epistles and the Book of Acts—the other treating similarly the remains (at least such as are judged authentic) of the Apostles of the Circumcision. In approaching the question whether our Four Gospels come from the Apostolic age or no, our author is fully conscious that we have undoubted works of that age to judge them by: but he seems unaccountably to forget that they may as legitimately be used to supplement them.

On the work as a whole it is very difficult to pass judgment, for the reason already stated—that it is not a whole; the three parts can only be examined separately and in detail. Nothing is common to them, except the author's temper, to some extent his method, and the cast of opinions hinted at, but never stated, far less demonstrated. His temper in controversy is generally so far fair, that he pays to his antagonist any deserved compliment without grudging; the *odium theologicum* appears less in direct personalities than in ridicule of a system when its advocate makes himself ridiculous. Even this arises, not from prejudice or narrowness of sympathy, but from obtuseness of sense to men's various logical and literary positions, to the habit of looking at things through the medium of books, and of treating one book as if it were as good as another, until he now and then loses patience with one altogether.

This fault, though detracting sensibly from the value of the Second Part, is naturally most conspicuous in the First; where, the question under discussion being abstract, the need of accurate reasoning is greatest, and where industry and research are least able to supply its place, or to atone with good facts for irrelevant arguments. The author knows that on questions of criticism, as in other progressive sciences, the views of the latest competent investigators are of more authority than those of their predecessors, even though these were men of greater individual ability; he forgets that an opinion, to be refuted, must be examined in its best form, and that in matters of speculation the best form is by no means always the latest or most recently popular. Whether the fourteenth and fifteenth chapters of our Fourth Gospel be the utterance of a nameless mystic of the second century, of the Apostle John, or of his Master, the view there taken of the evidential force of miracles, and their relation to divine inspiration and revelation, is a great deal better worth examining than the views of Paley, of Canon Mozley, of Archbishop Trench, or even of the late Dr. Mansel; it represents a great deal more worthily, and even more accurately, the actual common belief of thoughtful Christians upon the subject. And nothing is gained except to divert attention to a side issue, by playing off Canon Mozley and Dr. Newman against each other, on the question of post-apostolic miracles: the intrinsic credibility of *all* miracles is scarcely affected, whether they be regarded as credentials of a

revelation presented at its first promulgation, or as its natural and permanent concomitants or effects.

There are three real arguments advanced in this part of the work for the main thesis of the whole, besides this irrelevant one, that Christian apologists are not agreed on all questions of the logic of Christian belief. The order of nature is found in experience to be uniform; it is "anthropomorphic divinity" to suppose that God, having made the world without the power of self-adjustment, Himself adjusts it partially and at intervals; and the belief that He does so has, historically, prevailed in proportion to men's ignorance of the phenomena which the belief is used to explain. It is not pretended that any of these pleas are new, but the author seems to think that their force is becoming more manifest and more generally recognised; and as regards the last he is right—with the two former it is more questionable.

The first might be otherwise stated thus: no phenomena happen without causes, therefore no material phenomena can happen without material causes. This is either an *à priori* assumption, grounded on an arbitrary metaphysical view of the conditions of causation; or else it means that all physical phenomena can, as a matter of fact, be accounted for by physical causes, which is either a *petitio principii* or is not *à priori* at all. Our author here seems dissatisfied with "Mill's criticism on Hume:" but he fails to shake its validity. One man, it is admitted, had a fever and would have died if his doctor had not prescribed for him and his wife nursed him; another, it is alleged, had a fever and would have died if a Saint had not laid his hands on him, or his wife prayed for him. In the former case, sanitary and physiological phenomena succeeded one another in their regular course, but this did not prevent the result being modified when the conditions were modified under which the physiological laws acted; and in this case no one doubts the adequacy of the modified cause to produce the modified effect. Whether the cause be adequate in the second case or no, or, as Mill puts it, whether an imagined adequate cause be really present, is a question that can only be decided by experience; Mill would have agreed with our author that experience has decided it in the negative; but the knowledge that comes from experience must not be made to do double duty, and to dispense with the appeal to experience as well as to register its verdict when appealed to.

The second argument is little more than the invocation of a bugbear. If the belief in "a personal God working miracles" be anthropomorphism, you do not refute a believer in such a God by calling him an anthropomorphite. As a reply to Mansel, indeed, it is perhaps valid *ad hominem*: but it scarcely tells at all as against either the Scriptures or the main body of orthodox theologians, who are less afraid of admitting the analogy between divine and human modes of action. The author in fact sees that the objection is really not to miracles only, but to Theism as commonly understood. The difficulty is, how an omniscient, almighty, and benevolent Being came to create a world wherein evil would arise; it is not materially

complicated, if He have now and then interposed to cure the evils which we should have expected Him to prevent. On the contrary, the belief in such interposition is an attempt to solve the knot, which is cut by the Pantheistic conclusion which our author seems to favour—that the evil complained of is not real evil, and on the other hand, that the supposed will and power to prevent it has no real existence: this conclusion of his own mind being supplemented with one derived from Herbert Spencer, that the world will in time “evolve” itself into freedom from evil.

It is only the third and last argument, whose force there is no evacuating: men are, in fact, ceasing to refer physical phenomena to other than physical causes, because they find that, when the physical causes competent to produce them are understood, such phenomena do not appear without them, as, when they were not understood, were alleged to appear from other causes. Still, one could wish that the author's statement of the argument had been more judicial and less controversial: it would, for instance, have shown a wider range of thought if he had remembered, that the frequent connexion between ignorance and faith was avowed and gloried in by St. Paul, ages before it was insisted on and given a different significance by Buckle and Lecky. And though the evidence for such a connexion is undeniable, the evidence for the universal and proportionate conjunction of the two is somewhat overstated. In his eagerness to prove that the signs and wonders of the New Testament are not exceptionally well attested, he reminds us that St. Augustine not only “may be said to guarantee the truth and accuracy” of his stories of miracles done by the relics of St. Stephen, but that in the crisis of his conversion, when he was as nearly impartial an observer as an interested inquirer can be, and when his keen intelligence was as likely to be disgusted by a spurious miracle as to be attracted by a genuine one—he acknowledged undoubtedly those of the Milanese martyrs; and, again, that the Port-Royal miracle (to which it is singularly impossible to attribute any theological significance) happened under the notice, and commanded the assent, of one of the first physicists as well as thinkers of the age. It proves the author's honesty that he is not afraid to confess these facts, but, having done so, it would have been well to explain them.

In the fourth and fifth chapters of Part I., it is attempted to show in what a superstitious age the New Testament was composed, and its miracles assented to; but all the author's research into the childish parts of the Talmud does little to prove his point, that the writers of the New Testament, or even their followers, shared in the superstitions of their age—except, of course, in the one admitted case of belief in angels and demons, and in the bodily affliction of men by the latter. Apart from this question of possession and exorcism, it was certainly the effect of conversion to Christianity to deliver men from the superstitions, whether Jewish or Gentile, of the society they belonged to; they only did not care to contradict the superstitious belief,

because they could afford to ignore it. And if the mass of the primitive Christians probably did leave such beliefs uncontradicted, it is certain that their greatest minds rose above them. For instance, the common consent of Christendom believed the heathen gods to be really existing demons; but the belief was not derived from St. Paul: it was held in spite of him, or at least was forced to misinterpret him. Our author quotes 1 Cor. x., 20, 21, but he forgets that in the verse before the Apostle distinctly refuses to say “that an idol is anything, or that which is offered in sacrifice to idols is anything”—that, in fact, at the very commencement of his argument (c. viii., 1–4), he takes for granted the knowledge “that an idol is nothing in the world.” In truth, except for the implied acknowledgment of the real existence of demons, his view is that of common sense as well as moral honesty: the weak brother, with “conscience of the idol,” is no doubt superstitious, but his superstition deserves toleration and even sympathy, as, at any rate, it keeps him right on the practical point—that, though idols are not demons, idol-worship is demon-worship; and that in the heathen religion, as in the Jewish and Christian, the partaker of a sacrificial meal incurs, for good or evil, the full responsibilities of a worshipper. Again, in c. xiv. of the same Epistle, there is no doubt that we see common sense in contact with fanaticism; and the result is (for what it is worth) that common sense is found to be compatible with belief in and performance of even the most purposeless prodigies of the New Testament.

The fact is that superstition is a term hard to define. Our author seems to use it in the sense of a belief which the progress of science shows to be erroneous. This is much too wide to suit either with popular usage or with the requirements of his argument. Neither pseudo-Barnabas's queer stories about hares and weasels and hyenas, nor Lactantius' defective imagination and St. Augustine's mistaken reasoning about Antipodes, are properly superstitions at all; while St. Clement and Tacitus had no better reason (in the then state of science) for disbelieving the existence of the Phoenix than their contemporary Juvenal had for disbelieving that of the black swan. None of these erroneous beliefs (except perhaps the first) have any tendency to invalidate the writers' testimony to facts within their observation, or even to render it worthless as to matters of inference. Again, if belief in witchcraft and belief in demoniacal possession are ever so much superstitions, they are two superstitions, not one and the same. We cannot be sure that believers in the latter always believed in the former, while if they did, it is not clear that they were always practically or materially wrong. Witchcraft in the seventeenth century may have been a merely imaginary crime, but in the first century it was probably as closely connected with poisoning as it is with charlatanism now—quite enough to justify St. Paul for ranking *φάρμακία* among “works of the flesh,” between idolatry and hatred, and in company with uncleanness, drunkenness, and perhaps murder.

WILLIAM HENRY SIMCOX.

Le Peuple Roumain, d'après ses Chants Nationaux. Par Jean Cratiunesco. (Paris: Hachette & Cie., 1874.)

THE national songs of Roumania are among the least widely known of the ballads of Europe. M. Alexandri has collected them, and has trimmed and set them with more or less discretion, but they are still sufficiently obscure. Few lovers of ballads are strong in the Wallachian language, and still fewer wish to expose themselves to the chance of such a trick as Prosper Mérimée played with his Illyrian folk-songs. M. Alexandri, however, insists that his collection is genuine, and that he has done no more for his originals than Scott did for the snatches of Border minstrelsy. “J'en ai fait disparaître les taches, et leur ai rendu leur éclat primitif,” says M. Alexandri. But the process is a seductive and dangerous one, as the editor of *Barzaz Breiz* has found out. Every Percy is sure to have a Ritson, every De la Villemarqué a Luzels, to detect his pretty interpolations, and denounce his excisions. This unpleasant part has not been chosen by M. Jean Cratiunesco, who accepts the editions of Alexandri as trustworthy, and who attempts in this volume to illustrate the character of the Roumanian peoples, and to throw light on certain disputed questions of ballad lore.

Who composed the popular ballads of Europe? The ordinary answer has always been—the minstrels. Under the name “minstrels” the bards of primitive chiefs, the laureates of rough courts, the *jongleurs* who recited the compositions of others to feudal society, the “blind crowdiers” who were detested by the more polished singers, have all been grouped together in indiscriminate confusion. Ballads were supposed to be degenerate *fabliaux*, corrupted versions of lays like those of Marie of France. Ladies of rank, again, were said to have written them. No one would believe that ballads had, properly speaking, no author—that, as Topsy said of herself, in a crude guess at a theory of evolution, “they grewed.” This is M. Cratiunesco's answer to the question who made the ballads of Roumania. It was not, as some have supposed, the wandering *Tsigani*, or Bohemians, who composed them. They only sing the songs already current among the people. The people has evolved its own lays during the choral dances still practised in the principalities. What Herr Ulrichs tells us of the Greek peasants, what De la Villemarqué reports from Brittany, and M. Pitré from Sicily, is true of the Roumanian peasants: “La poésie populaire est restée fidèle à la vraie et primitive condition de la poésie, je veux dire l'alliance avec la musique et quelquefois avec la danse.” Above the dance the ballad rises from the mouth of the coryphaeus, as it were—the man or woman most stirred at the moment to give voice to some common feeling. This is M. Cratiunesco's account of the authorship of the Roumanian ballad. He would account for the many strange resemblances between the songs of all European countries by “la communauté de nature de l'espèce humaine.” . . . “All peoples will express themselves in much the same manner.” Now

this is so far true that there is nothing odd in the coincidences between songs of new-year time or spring tide in various lands. If Scotch children say the same words when they beg at the doors for cakes, at *Hogmanay*, as Greek children used when they carried about the swallow, it is only natural. But there are too many strange recurring formulae in the folk-songs of all nations to be accounted for thus. It is the verbal repetition of certain out-of-the-way expressions that needs to be accounted for.

It would be interesting to pursue M. Cratiunesco's speculation as to the reasons which cause an epic poetry to succeed the ballad stage in some countries and not in others. We should attribute it to the influence of an aristocracy of a different race from that of the people among which it lives. The *doctōs* of the divine Pelidae or Pisistratidae gradually amplified the ballad measure into a more imposing rhapsody, a *chanson de geste*.

However this may be, the Bojars have never developed folk-song into epic. The Roumanian ballads are of four sorts. The *Colinde* answers to the old French *Noëls*. The *Cantice Betruiesci* celebrate historical events, exploits of national heroes, or of *haiduci*, klephts or brigands. The *Doīnas* express love and desire; the source of their inspiration is the sentiment of *doru*, a longing which cannot be uttered except in the *doīna*. *Doru* is nostalgia, or love, or jealousy, and often turns to strange forms of emotion. The last class of ballads is the *Chora*, the most rapidly improvised, and the gayest of all. The whole history of the people as far as it is known to them is preserved in such *cantice* as live, and is lost with the thousands that the Finnish poet deplores. The character of the race would seem to be resolute and proud—a girl refuses to aid her husband in a combat, and owns that she means to give herself to the better man. Seven brothers of another lady stab her husband for venturing on a rather feeble joke. Celibacy is not in favour, and perhaps the prettiest ballad quoted in this work is that which sings of how the sad nun, Sister Magdaleine, yielded her heart. As the ballad, a wild and wonderful song, of the loves of the Sun and Moon, is too long to quote, we extract the song of the Sister Magdaleine.

"A travers un champ fleuri, dans un sentier sinueux passe un voyageur qui chante. Il a le cœur fané; il se plaint que dans ce monde personne ne sache son nom, que personne ne s'inquiète s'il est mort ou vivant. Voilà que la sœur Magdaleine, près de là, dans un jardin, l'entend; elle tombe dans des rêveries, et s'enflamme de *doru*."

'Voyageur attristé et égaré dans le monde! Tu es l'oiseau étranger qui chante dans le jardin et ensuite s'envole en laissant des cœurs embrasés.'

'Sœur qui consoles, tu es douce et belle! Tes yeux brûlent, ta figure éclate comme l'œillet quand le matin il se montre à la lumière, tout chargé de rosée.'

'Voyageur attristé, ton cheval n'est-il pas fatigué?'

'Non, ma chère, point du tout; mais il s'ennuie d'un si long chemin.'

"Le voyageur s'arrêta et borna là sa course."

The popular superstitions alluded to in the ballads are much like those of modern Greece; but Paon, the haunter of the forests, is less terrible than the Greek Charon. M.

Cratiunesco has written a lucid and interesting essay, though his quotations from the Latin classics are more numerous than appropriate. A. LANG.

Historical Papers and Letters from the Northern Registers. Edited by James Raine. Rolls Series. (London: Longmans & Co.)

"If anyone is in quest of the district where ecclesiastical registers are most accessible to any painstaking inquirer, and where they are most carefully preserved, he must come into the North." Such is Canon Raine's enticing invitation to the students of South England, and it must be confessed that he does his best to prove his words true. He has lately published the earliest York Register for the Surtees Society, and now gives us some choice historical documents from the three great ecclesiastical centres of the North,—Carlisle, Durham, and York. In Edward I.'s time, Carlisle was a great rendezvous for the English army, and we find therefore in Bishop Halton's register matter of considerable interest in connexion with Scotland, but this has been mostly published before. The register of Bishop Kellawe of Durham is now being published by Sir T. D. Hardy, but, besides the records of the see, the Chapter possesses a noble series of original evidences, "which may be counted by tens of thousands." The Archbishop's registers at York commence with the year 1225; and as the northern primate was one of the great agents for disseminating and enforcing throughout the North the mandates of the king and his council, it is only natural that his official act-books should contain the documents in which he was so much interested, and for the carrying out of which he was so largely responsible. Walter Gray's register has been partially printed by the Surtees Society. Walter Giffard's contains the earliest ordination lists extant, and the record of some very curious visitations of religious houses. They may be compared with the similar visitations carried out in the diocese of Rouen, also in the thirteenth century, by Archbishop Rigaud, which have been lately published in France. In Greenfield's register is perhaps the earliest document on paper, which came to the Archbishop from Italy. Thoresby's register contains an invaluable specimen of Northern English, in a sort of metrical catechism, translated from the Latin into the vernacular at the Archbishop's request by John de Gatrik. The early charters of the archbishopric have perished, like those of Durham (burnt by Bishop Cosin's executors!), but the Chapter has copies of most of them. The act-books of the Corporation of York do not commence before the close of the reign of Edward III., so that they have only yielded two or three papers for the present collection, which does not extend further than the fourteenth century—except that one document of 1415 is added, containing an account of the seizure of the effects of Henry Lord Scrope of Masham, at York, after the extraordinary conspiracy against Henry V. on the very eve of his setting sail for the campaign of Azincour. Mr. Davies has printed some of the later city papers, connected with Edward IV. and Richard III., and with Lambert Symnell's re-

bellion—which are especially valuable, as our information about Henry VII.'s reign is in many respects defective. The books of the later bishops, after 1350, lose almost all public interest, as the register becomes more and more a mere calendar of collations and institutions. The documents of this volume therefore may be said to range from 1260 to 1350, with a fringe on either side. They show how during that century the Northern ecclesiastics were burdened with taxation, and how they suffered the exactions and devastations of invading armies. The savagery of the warfare is almost beyond belief. In 1296–7 Northumberland and Cumberland were most cruelly ravaged by the Scots, and Hexhamshire and its priory were harried and left desolate. Carlisle experienced still more severe suffering, and the plaintive letter of Bishop Halton in 1301 is more outspoken than the chronicles. From November 1297 to September 1298 the Scots were besieging Carlisle, and at the same time eleven hostages from Galloway, pledges for the fidelity of that district, were pining away in the dungeons of Lochmaben. Eleven went in, but only one came out alive, after a two years' captivity. His companions ended their lives in that merciless prison. We have also a new account of the murder of the two Comyns at Dumfries, "the most sanguinary outrage, perhaps, that disgraced that sanguinary period" (we are transcribing Canon Raine's own words, but with some alarm as to their effect on our Scotch friends). After Bannockburn two or three of the northernmost counties were almost permanently occupied by the Scots. The people of Ripon, to save themselves, paid a fine of 1,000*l*. After 1322, there is little about Scotch affairs till the monks of Durham, with just pride, send to their absent bishop the tidings of the great victory of Neville's Cross. We need not wonder at the aversion with which the Scottish nation was regarded, long after the wars between the two peoples had come to an end. No person of that nation was allowed to become a citizen of places like York and Newcastle, and in the civic registers of York there are many certificates to show the English origin of men who were kept back from rising in their trades, by being falsely charged with having been born across the Borders. James I. was astonished to find that the English were not particularly anxious to have the Scotch naturalised in England, and in fact the two countries have not been really united for more than about a century.

We have some valuable information respecting the great plague of 1349, the Black Death, which filled the whole country with consternation and mourning. Hugh, Archbishop of Damascus, the suffragan, was sent hither and thither to consecrate new cemeteries. Clement VI. allowed everyone to select his own confessor, contrary to the strictly observed principle of parochial order; and granted Archbishop Zouche a licence to hold supplementary ordinations, to supply the ravages which the plague had made among the ranks of the clergy. There were not priests enough remaining to administer the sacraments.

For foreign affairs we may notice the documents relating to Edward I.'s crusade, and, above all, those connected with the Papacy

In 1294 the register of Bishop Halton at Carlisle contains a new and most minute account of the resignation of Pope Celestine V. The great foreign chronicler of the members of the Sacred College does not hesitate to speak of the intrigue which caused this cession as one of the dark spots in the annals of the Roman court. A new light is thrown upon the event by the paragraph at the end of the paper in the Carlisle register. We can see what sympathy was felt for the retiring pontiff far beyond the confines of Italy. One is glad to think that Dante was possibly referring to a base Florentine, and not to Celestine, when he spoke of the man who was guilty of the baseness of the "great refusal." Dante too hated Celestine's supplanter, the crafty fox Boniface VIII. In November 1309, we have a letter from Philip the Fair, King of France, in which he endeavours to stimulate Archbishop Greenfield to take energetic action against the unfortunate Templars. He sums up his case against them thus:—"Absque terrore cujusque et coactione qualibet, sunt confessi quod est consuetudo dicti Ordinis, immo juris corruptela, quod in receptione cujuslibet, qui recipitur Christum abnegat, supra crucem quæ eidem ostenditur sput in vituperium crucifixi; ad multa scelera et crimina detestabilia inimica fidei Christianæ, et humanæ disconvenientia rationi, se obligant, et ea permittant complere."

There are several notices of scholars and historians in this volume. One document proves that Roger Hoveden was among the early rectors of that little market town in Yorkshire whence he derives his name. In 1293 we have a notice of another well-known writer, Peter de Langtoft, whom Archbishop Romanus accuses of having gone away into South England without leave. Canon Raine thinks it was a longing after the acquisition of knowledge which, in all probability, carried Langtoft into the South; and we feel grateful to him for defending the South, if it is only this once, against that stern Northerner, Archbishop Romanus. Our Yorkshire friends have also a strong sympathy for the claims of the see of York as against Canterbury; but they have mournfully to confess that the effect of the struggle was to make York subservient to Rome. The tone and language of the letters which passed from York to Rome, indicate a degree of submission which may be looked for, perhaps, in vain in the province of Canterbury. The York service-books also are more after the Roman standard than those of the Salisbury use. We have glimpses too of other Yorkshire writers, such as Walter of Hemingburgh, and perhaps Adam Mirymouth. Cardinal Adam of Eston, the Dean of York, was imprisoned by the suspicious Urban VI., and it was only the efforts of his brethren in England that saved him. Archbishop Melton has to write a very humble letter to John XXII. to ask pardon for having done what was simply his duty, in consecrating Robert de Graystanes, the historian, to the see of Durham. Durham too was often disobedient to York, and the bishops of Man did not recognise its jurisdiction; and Whitherne, in Galloway, which did, suffered heavily from the Scotch in consequence, and the contumacious people of Glasgow looked on the nominees of York as anything but their lawful bishops. On the

whole, what with the arrogance of Canterbury and the revolt of the Scots, the Archbishops of York had much to suffer; and what was worse, they were regarded as intruders in Durham; one of them was driven out even from Beverley Minster, and Archbishop Melton complained to Edward III. that he had been twice prevented from holding a visitation of York minster by an armed force, arrayed there, no doubt, by the dean and chapter, with whom he was bitterly at variance. In fact, assaults upon clergymen and bishops, and sacrilege in various forms, were of frequent occurrence in those days. An assault on the Bishop of Carlisle was of so grievous a character, that the aid of the Metropolitan was called in to provide a punishment for the crime. Louis de Beaumont, Bishop-elect of Durham, was riding leisurely along in the train of two cardinals, a few miles from the chief city of his diocese, when a Northumbrian knight surrounded them with his armed followers, and the cardinals and their suite found to their cost that brigandage was not confined to Italy. The Borderers looked on such wealthy travellers much as Scott describes their brethren in Scotland looking on Sir David Lindsay of the Mount and his English friends, when Marmion was on his way to the Scotch court. If anyone is in quest of a wild and romantic story, let him read the complaint which Edward III. made to Innocent VI. against Richard Ledred, Bishop of Ossory, a man who was a centenarian in age, deaf, diseased in body, and at times a lunatic, who sets up in his diocese an inquisition of his own, and creates so widely spread a terror by his ferocity and extortion, that even the royal justices of assize shrank from the neighbourhood of the perpetrator of the crimes which it was their duty to repress. The king, apparently as helpless as his officers, writes to the pope for his assistance.

We have given an abstract of the editor's own excellent summary of his work, and our readers will see that these admirably selected documents are of great social as well as political interest. If there is a fault to find, it is now and then, but very rarely, with the punctuation: e.g. in p. 6 the construction runs, "si . . . dicebat, non debuisti;" but the interposition of two full stops makes the sentence anything but clear. The book, however, is in all essential points a model of how records ought to be edited.

C. W. BOASE.

A Handbook for Travellers in North Wales.
Fourth Edition. (London: John Murray, 1874.)

THE extensive railway system of North Wales, which has rendered a new edition of the *Handbook* necessary, has opened up to the ordinary tourist many parts of the Principality before accessible only to those provided with long purses or stout limbs. Entering North Wales by way of Shrewsbury and Wrexham, and leaving it by Oswestry, Llanidloes, and the Upper Valley of the Wye, it is quite possible, without quitting the numerous intersecting lines, to see a good deal of grand scenery, and to visit many interesting spots. But we hardly need add that the tour would be performed far

more satisfactorily by carriage or on foot, as circumstances require; and that it is only to the pedestrian that the more exquisite beauties of hill and valley, stream and tarn, reveal themselves. There is certainly no part of Great Britain which offers a better field for the pursuit of health, pleasure, and physical science than North Wales; and we can only regret that, where nature has been so lavish of her best gifts, their enjoyment should be so often marred by the absence of comfortable quarters, and even of ordinary cleanliness. Except at places like Bangor, Capel Curig, Bettws-y-Coed, Dolgelley, and others on the beaten tracks, there is but poor fare and poorer accommodation to be found for English wayfarers in North Wales; and though in most respects we agree with the editor of the *Handbook*, and can give him the highest praise for accuracy and general trustworthiness, we feel bound to enter our protest against his statement that "hotel accommodation as a rule is plentiful, varied, and good." We have, indeed, found it "varied;" but the varieties have not been such as have commended themselves to our taste.

The chief additions that have been made to the *Handbook* since its last issue are the very valuable articles on Harlech Castle and Cymmer Abbey, from the pen of Mr. G. T. Clark, and some interesting notices of Denbighshire churches, from the Rev. D. R. Thomas's forthcoming *History of the Diocese of St. Asaph*. The doings of the Fairlie-double-bogie on the Festiniog railway are duly described, and a good deal of fresh matter has been extracted from the recent volumes of the *Archæologia Cambrensis*. Of course there are still a few errors and omissions, and we are but complying with the reviser's request in calling attention to such as have caught our notice. We observe, for instance, that Guilsfield is described without any reference being made to the most interesting spot within its limits, namely, Broniarth, where Oldcastle, Lord Cobham, long time lay concealed, and at length was captured by Sir Edward Charlton. The scene of the capture is still called "Cobham's garden," and many traditions of the Lollard martyr are yet current in the neighbourhood.

Alberbury contains the birth-place of Old Parr, the most famous of centenarians, as well as the seat of Sir Baldwin Leighton, and it might have been well to notice that on the Breidden Hills the last great struggle took place between Caractacus and his Roman foes. The Barons Montalt, who occupied Hawarden Castle, may have left descendants known by the name of Mold, but the more common variations of the name were Mahant, Mowhant, and Maude, the last being that still borne by the Viscounts Hawarden, who claim to be representatives of Eustace de Monte Alto, the original grantee of Hawarden.

A large section of the *Handbook* is of course occupied by a description of Snowdon, and of the various routes by which the mountain may be ascended. To a member of the Alpine Club the language employed may seem rather extravagant, and he will find it hard to take *au sérieux* all that is said about the dangers and difficulties of an

ascent. But the truth is—and an accident which has just occurred confirms it—that these smaller mountains tempt unwary travellers to dispense with precautions which in the high Alps would never be neglected, and to forget that mists and fogs are as apt to prevail at low altitudes as at high ones. Just as the acknowledged danger of a feat often becomes its safety, so may its apparent simplicity absolutely increase its risk. The writer of the *Handbook* has, we think, fallen into an error in his remark that Snowdonia was once a well-wooded district. The term "forest," which was given to it, implied no more than its reservation as a royal chase, and it would be very unsafe to infer from it the existence of trees, except in the sheltered dells.

The very name of Snowdon conjures up so many pleasant reminiscences of mountain wanderings, that we cannot do otherwise than advise those who need a holiday, and are in doubt where they shall spend it, to commit themselves unreservedly to the guidance of Mr. Murray, and derive health and delight from the varied attractions which North Wales has to offer.

CHARLES J. ROBINSON.

La Vita Nuova di Dante Alighieri, ris-contrata su codici e stampe, per cura di Alessandro d'Ancona. (Pisa, 1872.)

THIS new edition of Dante's *Vita Nuova*, by Signor Alessandro d'Ancona, Professor of Italian Literature in the University of Pisa is a handsome volume in quarto form, and contains a revised text of the work, together with a prefatory notice, a study on Beatrice, and explanatory notes. In the prefatory notice the writer explains the principle of his revision, and the division of the work into sections, on which point he differs from Witte and Orlandini, who have treated of the same subject, and gives an interesting account of the six important MSS., on which, together with certain printed texts, his revision is based. The various readings which these present are given at the foot of the text.

The essay on Beatrice is for the most part occupied with a discussion of the relation borne by the *Vita Nuova*, the *Convito*, and the *Divina Commedia*, to the life of Dante, and to one another. In many of its main outlines his view does not differ considerably from that put forward by Witte in his *Dante-Forschungen*. He begins by controverting—at greater length than we in England should consider necessary, but perhaps this is not the case in Italy—the views of those who either deny that Beatrice was a real person, and consequently regard the *Vita Nuova* as simply an allegory, or, while admitting the existence of Beatrice, maintain that the love which Dante there describes was for an ideal person. His own view is that throughout those works of the poet in which Beatrice is introduced, she is at once both real and allegorical, and he claims to have started a new method for arriving at this conclusion, viz., by a psychological study of Dante. The mystical element in the *Vita Nuova* is to be regarded as the natural result of the character of his mind; and so the visions it contains are not the product of

artistic study, but of an ecstatic mode of viewing things; and in this way Beatrice, from being a beautiful and virtuous lady, becomes to him the personification of perfect beauty and perfect virtue. He traces three distinct stages in the poet's feeling towards her: the first, which is described in the early part of the *Vita Nuova*, is natural passion, perfectly pure indeed, but accompanied by all the signs which indicate human love: in the second, these more earthly elements have fallen away, and she becomes to him, even during her lifetime, the object of a spiritual adoration: in the third, which commences with her death, she is transfigured into the person, half real, half allegorical, which appears in the *Commedia*. The *gentil donna*, or "lady of the window,"—who is introduced at the end of the *Vita Nuova*, and is represented as estranging Dante's heart from the memory of Beatrice—Signor d'Ancona, like the majority of modern critics, regards as an actual person, notwithstanding that, when the same lady is introduced in the *Convito*, Dante distinctly states that she was no mortal love, but Philosophy; and of this apparent anomaly our author finds an explanation in the poet's habit of engrafting allegory on a real personage. Owing to certain similarities which impress him, he is led to identify his later source of temptation in Philosophy with the lady who had drawn him away from Beatrice. As in the one case he had first been attracted to the lady by the consolation afforded by her sympathy, and afterwards had admired her for her own sake, so in the other case he gave himself up to Philosophy in the first instance in order to forget his grief, and then became enamoured of it for itself. To this Signor d'Ancona adds the suggestion that Dante may perhaps have desired, by this later explanation of his affection for the *gentil donna* as love for philosophy, to ignore the fact that he had ever been untrue to his first love. In this way three deviations from his allegiance to Beatrice are traceable in the interval between her death and his exile—the episode of the "lady of the window;" the moral aberrations, which are referred to in the *Purgatorio*; and the intellectual deflections, which are described in the *Convito*. Beatrice herself, in her allegorical aspect, is regarded by our author as representing no one special notion, such as Theology, Contemplation, Ghibelline Politics, or the Catholic Church, but "the universal Idea."

The notes at the end of the volume are elaborately compiled from various sources, and the writings of German scholars, such as Witte and Wegele, which are not as well known as they should be to Italian students of Dante, have been laid under contribution.

H. F. TOZER.

Le Li-sao. Poème du III^e siècle avant notre ère. Traduit du Chinois, accompagné d'un commentaire perpétuel, et publié avec le texte original par le Marquis d'Hervey de Saint-Denys. (Paris: Challamel aîné.)

It is indicative of the antiquity of Chinese civilisation that all the most celebrated literary productions of China are the work of authors who lived before the Christian era.

The most ancient book of the "Five Classics"—the *Book of Changes*—is said to have originated with the Emperor Fu-hi, who lived about B.C. 2852; and the latest—the *Spring and Autumn Annals*—was written by Confucius, probably at the beginning of the fifth century before Christ. Of the "Four Books," three are believed to have been compiled by the personal followers of the sage, and the remaining one records the sayings of Mencius, who lived B.C. 350. On these nine books hang all the subsequent works of the Chinese. Every author of any pretension to merit strives as far as in him lies to imitate the style of these great prototypes; and the more frequent the allusions to the events recorded in them, the more value is laid on the scholarship and learning of the writer. Chinese poetry is, *pari passu*, stereotyped after the model of the ancient poems compiled by Confucius in the third of the five classics, entitled the *Shi King*. These are short, disjointed odes, bearing on political and social subjects, and, like the ancient Hebrew writings, full of striking and varied imagery. The celebrated poems of the Tang Dynasty are all cast in a similar mould; and the same may be said of by far the larger number of all subsequent poetical effusions. From time to time, however, new styles have been introduced, and Chinese poetry may now be classed under four headings: the *Shi*, or odes; the *Tsoo-tsze*, or elegies of Tsoo, of which the "Li-sao" is the principal specimen; the *Ko*, or songs; and the *Fu*, or lyrical pieces. The distinguishing features of the elegies of Tsoo are their length—the "Li-sao" is composed of 373 verses—their metre, which consists of stanzas of four lines rhyming alternately, and their subject, which is invariably a cry of complaint.

The excellences of the "Li-sao" and the unjust persecution to which its author, Kiu Yuen, was subjected, together with the manner of his death, have rendered his name immortal. Like Confucius, he was for years a Minister of State, and, like that sage, he was driven from office by the intrigues of designing courtiers. According to the historian Sze-ma Tsien, after having been for years the friend and adviser of the King of Tsoo, he fell into disgrace, and was banished from his master's presence. Then it was that he wrote the "Li-sao," which being interpreted means, "The Lament of an Exile." Subsequently the king, at the instigation of Kiu Yuen's enemies, entered upon a line of policy towards the surrounding states which ended in his losing his throne and ultimately dying in captivity. Pondering over these sad events, Kiu Yuen was one day walking by the river Milo, dressed in mourning and with dishevelled hair, when a fisherman thus accosted him, "Are you not one of the great ones of the empire? How is it that you are reduced to this state?" "The whole world is in disorder," replied Kiu Yuen, "and I only am left who am pure. All are steeped in drunkenness; I alone am vigilant. This is the cause of my being exiled." "The true sage," said the fisherman, "knows how to keep pace with the times. If the whole world is in disorder, you should accommodate yourself to the state of things. If every one is drunk, why don't you also drink? Is it worth while to endure exile

in order to preserve your purity?" "I have heard it said," replied Kiu Yuen, "that the man who goes to the bath takes care to dust his hat and change his clothes. What man when he is clean likes to touch that which is dirty? I would rather drown myself in this river and become food for fishes than sully my purity by contact with a corrupt age." With these words he plunged into the river and met his end.

Great difficulties attend the translation of the "Li-sao." The style is often obscure, and always concise, and for the most part the stanzas abound with fanciful expressions emblematical of the virtues and vices of those of whom the poet writes. For instance, in describing his own perfections he says—

"Je réunis la plante *li* des rivières à l'herbe *chi* des vallées profondes :

Je nouai le *lai* de l'automne pour m'en faire une ceinture."

The native commentators explain this passage by telling us that it was the custom of the ancients to carry perfumes in their belts, and that the odoriferous plants mentioned here were emblems of all the virtues, just as rank-smelling herbs were held to symbolise the vices. Much in this strain Kiu Yuen, throughout the poem, describes the ingratitude of the world towards himself. Driven from the court of his sovereign, he represents himself as having, Diogenes-like, traversed the world in search of an honest man, and in this relation his verses throw an interesting light on the geographical knowledge possessed by the Chinese in the third century B.C. He tells us that in a vision he visited the extremities of the world, and thus indicates their localities:—After crossing the Hindoo Koosh, he says, "I watered my horses in the Lake Hien, and finished by fastening them to the branches of the *Fu-sang*, after having gathered a twig from the *Jo* tree." According to the commentators the sun goes down into the Lake Hien, and rises in a bright valley where grow the *Fu-sang* trees. Kiu Yuen's meaning therefore is that he visited the extreme west and east. As the Marquis d'Hervey de Saint-Denys remarks, it is strange that the inhabitants of China, having the Pacific Ocean as their eastern boundary, should ever describe the sun as rising from the land, and this ancient belief has given rise to many curious surmises, not the least strange of which is one to which the Marquis lends his countenance; namely, that by the kingdom of *Fu-sang* is meant America. The grounds for this belief are found in the writings of a Buddhist priest who arrived in China towards the end of the fifth century. He states that the kingdom of *Fu-sang* lies between six and seven thousand miles east of China, and that it derived its name from the *Fu-sang* tree, which grows there in abundance. The fruit of this tree resembles a pear, and cloth and paper are made from its bark. The carts of the natives of the country, he further tells us, are drawn by horses, oxen, or stags; and he adds that silver and copper have no value there, and that iron is unknown.

The one fact of the mention of horses ought of itself to be enough to destroy the theory set up by Deguignes, and adopted by the Marquis and others, as it is beyond

dispute that at the date referred to horses were unknown in America. But the utterly incredible statements further made by the Buddhist priest prove him to be a most untrustworthy witness. As an instance we may quote his assertion that about 400 miles east of *Fu-sang* there is a kingdom in which there are no men, but only women, whose bodies are completely covered with hair. "When they wish to become pregnant," he adds, "they bathe themselves in a certain river. The women have no mammae, but suckle their children from tufts of hair on their necks."

The Marquis explains the poet's reference to the *Jo* tree as signifying that he had visited the extreme north, and supports his belief by quotations from native authorities. According to these, there exists a country in the extreme north west from China, where the sun is only occasionally seen, and where, when it has disappeared from sight, the red flowers of the *Jo* tree illumine the land. Is not this, gravely remarks the Marquis, the image of the phenomenon common to hyperborean countries, where the tops of the trees catch the rays of the sun long after it has sunk below the horizon? As a specimen of the ancient poetry of the Chinese, the translation before us is well worthy of perusal. Judged by a European standard, the intrinsic merits of the poem are small. But apart from its poetic value, a certain amount of interest naturally attaches to a work which has, as the copious notes supplied by the Marquis abundantly prove, attracted the attention of Chinese scholars and commentators for more than twenty centuries.

ROBERT K. DOUGLAS.

INVADERS AND INVADED.

The Germans in France: Notes on the Method and Conduct of the Invasion; the Relations between Invaders and Invaded; and the Modern Usage of War. By H. Sutherland Edwards. (London: E. Stanford, 1874.)

MR. HENRY SUTHERLAND EDWARDS has, we believe, had very considerable experience as a war correspondent, and the work before us is therefore likely to be of much value as a memoir of what happened within his own particular notice during the Franco-German campaign.

Mr. Edwards accompanied the invading army throughout the war, and he has written, we think, a truthful account of what he saw; but only what he saw while in the company of Germans, and in daily intercourse with them. Although we should be the last to question the value of Mr. Edwards's work, we cannot help saying that we think it is to be regretted that so many of the books published in this country on the Franco-German campaign should have been due either to the pens of Germans, or to those of gentlemen who accompanied the German armies, and therefore observed the campaign from a German point of view. It may possibly be forgetfulness on our part, but at the present moment we cannot recall to memory more than one or two volumes treating of this subject written by persons who were with the French armies. The public

have never as yet known the truth of what is not unfrequently termed "the Garibaldian fiasco." No one appears to have any clear idea of what Garibaldi and his army accomplished, or failed to accomplish, or of what they were expected to achieve; and, yet, few people ever lose an opportunity of sneering at the good old general, or of endeavouring to turn him into ridicule, although almost all they really know about his doings in France is derived from the statements of his calumniators. There must, however, be persons capable of giving us an authentic story of the Garibaldian campaign in the Côte d'Or, and we should heartily welcome such a book, as well as the works of men who accompanied any of the French armies during the war, as missing links in a chain which is now almost completed.

Although Mr. Edwards seems to be prejudiced in favour of the Germans, he cannot be accused of being either bitter towards the fallen, or boisterous in his praise of the victors. He confines himself, for the most part, to an unpretentious narrative of what he witnessed, interspersing it with anecdotes, which, being told in a light and agreeable style, admirably illustrate the peculiarities of the people with whom he mixed. His book, moreover, has the merit of being novel in its arrangement. Instead of forcing upon us a full account of his own personal experiences and recollections, as is the custom with many war correspondents, he has written a volume which gives the reader a capital idea of how a continental war is conducted in the present age.

That belligerents need have no great scruples concerning the legality of their acts is evident from the whole tenour of the work before us:—

"One day in an occupied house," says our author, "it was suddenly announced that a Prussian minister was about to arrive on his way to Versailles. 'Who can it be?' was asked on all sides, the principal ministers being at Versailles already."

"I suggested by way of absurdity that it was, perhaps, the Minister of Justice."

"'God help him!' said a Prussian officer who at once seized my idea. 'To see how justice is administered here would drive him crazy.'"

After devoting a few pages to the nature and character of invasions, and the difference existing between invading and invaded forces, Mr. Edwards gives us an interesting chapter on the composition of the Prussian army, carefully explaining, *en passant*, the admirable system by which it is mobilised and poured on to the battlefield in overwhelming numbers within a few days of a declaration of war; but it is when speaking of the entrance of hostile troops into a foreign country, and relating as a case in point the invasion of France by the Germans, that he begins to take a firm hold on his readers, and to show his power as a descriptive writer. It must, indeed, have been a curious sight to have watched the German army, which he describes as passing, on August 8, from the main street of Saarbrück up the streets at right angles to it, gaining the heights and making for Forbach.

"There were hussars in light-blue and red, dragoons of all colours, cuirassiers with steel glistening over tunics of white cloth, lancers with

banners furlled, in token, not of having struck, but of an intention to strike; cavalry of all kinds, the infantry marching strongly and steadily forward in long snake-like columns, followed by artillery, ammunition-waggon, provisions carried in carts, and oxen. Then came more troops; then, after the destructive columns, the sanitary columns; and, finally, what may be called the spiritual columns. Infantry to perforate the foe, artillery to smash him, cavalry to lacerate him, and, at the same time, knights hospitallers, bearing the red and white cross of neutrality, to drag him from the field of death; sisters of mercy to tend him, doctors to cure him, or, if it be too late for that, priests to save his soul."

When the troops had fairly quitted the town, they were joined by others from neighbouring encampments, and then the main body in an unbroken line made its way towards Forbach.

"Parties of cavalry kept the heights on the left and patrolled the forests on the right; the *Kernenträger* went across the hills where numbers of the dead were still lying, and whence the last of the wounded had only that morning been removed. The heights which the French had occupied for some days after the affair of the 2nd looked now like the scene of a recent picnic. Here a bottle, there a piece of paper which might have enveloped sandwiches or the *butterbrod* of the country; there the remains of a wood fire; there the lid of a tin pot; then more remains of wood fires, more lids of tin pots, and broken bottles innumerable—the sort of *débris* one sees on a racecourse the day after the race."

At last the army reached the frontier and the battlefield where Frossard had been defeated. "The first occupied house in the first occupied district," says our author, "was not worth occupying, and the disconsolate Frenchwoman to whom it belonged sat on the door-step of her dilapidated inn, the image of desolation." This was the *Hôtel de la Brème d'Or*, around which some very desperate fighting had taken place, the house having been most obstinately defended by the French until late in the day. After describing a German entry into a foreign country, Mr. Edwards draws a vivid picture of an occupied town. There the invading troops are billeted on the inhabitants, with the right to claim a specified quantity of provisions from their hosts. Requisitions for food, clothing, carts and horses, are issued; contributions of money are levied, peasants pressed into the service of the invaders as drivers, and even as grave-diggers; the invader's money is made legally current, and his regulations as to the general conduct of the inhabitants are published in the form of proclamations.

"They must give up their arms. They must at a certain hour put out their lights; in case of disturbance at night they must show lights in all their windows. They must hold no communication with 'the enemy,' or with any person in the unoccupied part of the country. They must not act voluntarily as guides to the enemy. If called upon to act as guides to the occupying troops, they will mislead them at their peril. If they must not join the hostile army, still less must they form bands on their own account. They must not cut the telegraph or injure the railway; and the penalty for disobedience in every case is death. If the railway or telegraph is injured and the offender cannot be discovered, a fine is imposed on the town or commune; and if the fine, or the usual money contribution, be not forthcoming, hostages are taken and detained until it is paid."

In one part of his book Mr. Edwards casually mentions the "horse shows," which according to him were occasionally held by the Germans towards the end of the war. This is slightly incorrect, for from the very commencement of the invasion, the first thing the German troops were in the habit of doing upon entering a town, was to issue proclamations calling upon the inhabitants to send all their horses to the "Grande Place" at a certain hour on a given day, when a party of veterinary surgeons inspected the animals and kept all that were considered serviceable.

At page 206, speaking of the *Francs-Tireurs* he says:—

"What they [the Germans] required was, that he [the *Franc-Tireur*] should carry papers showing that he belonged to some regularly organised corps; that he should wear a uniform recognisable at gun-shot distance; and that the distinctive marks of the uniform should be inseparable from his person. Let him comply with these conditions, and the *Franc-Tireur*, if he fall into the hands of the enemy, instead of being shot or condemned to ten years' imprisonment (strange sentence!) was treated as a prisoner of war."

These may have been the outward professions of the Germans, but it is well known that they publicly stated throughout the invaded districts of France their intention to shoot any *Garibaldians* or *Francs-Tireurs* who fell into their hands, and the writer of this article holds proofs of their having carried out their threat in cases when their victims were provided both with uniforms and papers showing that they were soldiers.

The chapter entitled "Journey through an Occupied District," and "Invasion of a District held by the Enemy," are both interesting, especially the latter, in which our author relates how, being unprovided with proper documents from head-quarters, he was arrested on the battle-field before Sedan and forced to march with a Bavarian battalion until the end of the action, remaining under fire for several hours. In the next chapter, on Sedan, he relates the conversation which took place between Moltke and General de Wimpffen, when the latter arrived at the German head-quarters for the purpose of arranging the conditions of surrender. General de Wimpffen is reported to have said that the German positions were not so strong as Moltke wished to make believe, whereupon the latter replied—

"You do not know the topography of the environs of Sedan; and here is a curious detail which is characteristic of your presumptuous and thoughtless nation. At the beginning of the campaign you distributed to all your officers maps of Germany, when you had no means of studying the geography of France, when you had no maps of your own territory. Well, I tell you that these positions are not only strong, they are formidable and inexpugnable."

This was an effective, although a somewhat offensive speech. We must not forget, however, that when war was declared, all the German officers were provided with maps of the country they were about to invade, while maps and plans of their own country were somewhat scarce among them. Had hostilities commenced in Germany instead of in France, it is quite possible that the French might have proved themselves

much better geographers than their opponents.

The remaining chapters are devoted to a description of the scene which occurs after a great battle, the rôle played by *Francs-Tireurs*, and the right of self-defence, the siege and occupation of Strasbourg, an occupied line of railway, artillery trains, occupation of deserted districts, principles of war legislation, modern usages of war, and bombardment of fortified towns, with the instructions for the government of the armies of the United States in the field—subjects which are always likely to prove highly interesting. The chapter on *Francs-Tireurs* and the right of self-defence is hardly long enough to treat the subject properly, and we think that a chapter devoted entirely to the subject of requisitions would have been of considerable value.

We must not take leave of Mr. Edwards's book, one of the most entertaining that have been written on the Franco-German war, without quoting some lines which he says appear beneath a series of old designs to be found in almost every house on both banks of the Rhine. They are known as the "Seven Conditions," which are represented by typical figures:—

"The first is the Emperor, who says, 'I levy tribute;'

"Next comes the Nobleman, who says, 'I have a free estate;'

"The Priest says, 'I take tithes;'

"The Jew (mediaeval type of the trader) says, 'I live by my profits;'

"The Soldier says, 'I pay for nothing;'

"The Beggar says, 'I have nothing;'

"The Peasant says, 'God help me, for these six other men have all to be supported by me.'"

EDWARD HENRY VIZETELLY.

Geschichte der Mauren in Spanien. Von Reinhart Dozy. (Leipzig: Duncker & Humblot, 1874.)

THIS is the first volume of a translation into German of the well-known *Histoire des Musulmans d'Espagne*, by Dr. Reinhart Dozy (Leyden, 1861, 4 vols. 8vo), from 711 to 1110, or, in other words, from the conquest of the peninsula by Tárik and Músa Ibn Nossayr to the arrival of the Almoravides. The translator's name is not given in the title-page of the volume, but we are duly informed in a preface, signed by Dr. Wolf Wilh. Graf von Baudissin, that "with the consent and approval of the author (Dr. Dozy) the version has been accomplished by the dear hand (*liebe Hand*) of a lady most closely related to him (the Countess herself, or her daughter?)."

That the translated work is the best of its kind, and has met with general applause, is a fact that requires no demonstration, Dr. Dozy's labours, both as an oriental scholar and as an historian, are highly commendable; and though he has at times shown no mercy on those who preceded him in his task, and has rudely handled Casiri, Conde, and the rest, there can be no doubt that he has contributed more than any one else to illustrate the period of Mohammedan rule in the Peninsula. Not only did he avail himself of all the materials, Arabic as well as Latin, printed or manuscript, preserved in the libraries of Europe, but by publishing the original texts of Ibn Árib, Ibn

Âdzari, and lastly of Al-makkari, he prepared himself, as it were, for the task of compiling a general history of the Spanish Moslems.

The learned Professor's history comprises only that period of Mohammedan sway which may be properly called the *Arabian* period. And we say *Arabian* because, though the first invasion of Spain was chiefly accomplished by Berber tribes, partly and imperfectly converted to Islâm, it was the Arabs under Músa who ultimately subjugated that country, and drove the relics of the Wisigothic monarchy to the Pyrenees on one side, and to the north-west and the Atlantic on the other. Under the *amirs*, or governors who succeeded Músa, and later still under the Beni Umeyyah—who, expelled from the East, went to found a dynasty in Spain—numerous Arabian tribes formerly established in Syria, Egypt, and Palestine, kept pouring into the Peninsula, and swelling the ranks of the conquerors. To them were owing in the first instance the culture, the arts, the literature, the manners, and whatever else made Spain so different from other European States during the Middle Ages. The Berbers, it is true, were powerful auxiliaries at the conquest and afterwards, but they were a rude and ignorant set, speaking but imperfectly the Arabic language, mostly professing Judaism, or sunk in the depths of idolatry; incapable alike of receiving or imparting civilisation.

This first period of Mohammedan history in Spain—from the conquest to the arrival of the Almoravides—which is that contained in Dr. Dozy's history, cannot therefore be styled otherwise than "the *Arabian* period." From Yûsuf Ibn Tashfin down to the last sovereign of the dynasty of the Lamtunah or Almoravides,—from Âbdallah Ibn Tiumarta, the founder of the religious sect of the *Almowahedin*, or Unitarians, commonly called Almohades, to Mohammad An-nâsir, who lost, in 1212, the battle of Las Navas de Tolosa,—may be styled "the *African* period." The kings of Granada, though of truly Arabian descent, and having gathered round them whatever little remained of the old Arabian stock in Mohammedan Spain, were so assisted in their struggle with the Christians by the Beni Merin and other African tribes, that they may be classed within this second period. But in no manner can we approve of the translator designating the Mohammedan rulers of the Peninsula—Arabian as well as African—under the general name of *Mauren*, since they were distinct and separate races having no connexion with each other. Their coming from *Mauritania* is certainly no reason for calling them *Moors*. The old Spanish chroniclers, from Isidorus Pacensis down to Rodericus Toletanus, never designate the first Mohammedan settlers otherwise than by *Damasceni*, *Arabes*, *Sarraceni*, *Agareni*, *Ismaelitæ*, &c., none of which denominations can be applied to the Berbers or Africans. To avoid this difficulty Dr. Dozy very properly calls them in his history *Mussulmans* or Moslems, i.e. people professing Islâm. Why should the German translator have considered himself or herself authorised to deviate from the paths so wisely marked in this respect by the learned Leyden Professor, we are at a loss to understand, as no

reasons are given for it, and especially as the original work does not go beyond the strictly *Arabian* period.

An announcement is made both in the title-page and preface of the book which naturally attracted our attention, and made us hail with joy the appearance of a translation said to contain original contributions by the author (*Originalbeiträgen des Verfassers*), the learned Professor having placed at the disposal of the Count his own copy of the *Histoire des Mussulmans*, &c., with remarks and additions both to the text and the notes. We appreciate at their full value the labours of Dr. Dozy, and, therefore, were curious to know how far he had been able to increase his information, or modify his opinions respecting certain facts in the history of Mohammedan Spain, which, for want of materials, still remain in obscurity. We mean that very momentous period—from the reign of Mohammad, the fifth amir of the Umeyyah dynasty, down to the accession of Âbd-r-rahman III., *An-nâsir-lidinillah*—during which the interminable feuds between the Arabian tribes of Modhar and Yemen were again revived, the Berbers siding with either of the contending parties, whilst the *Movallads*, half Moslems and half Christians, also took up arms everywhere, especially in the south, to assert their independence. What was the origin of that vast conflagration and civil war, extending from one corner of the Mohammedan Peninsula to the other, and threatening the dissolution of the Moslem empire? Was it that the unruly spirit of the Arabian tribes showed itself more vividly on that occasion, and that the Modhar scorned to acknowledge the supremacy of the Umeyyah, or was it that the Berbers—who had always pretended the conquest to have been virtually their own, and their share in the spoil of the vanquished small and inadequate—now strove to assert their rights and gain by the general confusion? Who were, properly speaking, those terrible *Movallads*, who, under the leadership of Omar Ibn Hassum, the renegade, and his two sons, occupied Ronda and the adjacent districts, and twice threatened Cordova? What part did the Murarabs inhabiting Toledo, Seville, Merida, and other large cities of Mohammedan Spain, take in that fearful struggle for power or independence which lasted half a century, and was only put down by the firm hand of the wisest and most successful of the Beni Umeyyah, *An-nâsir lidinillah* (Âbd-r-rahman III.)? All these are historical problems to which no satisfactory solution has yet been given, owing no doubt to the loss of several contemporary writings, and especially of the voluminous History compiled by Ibn Hayyan, of which one part only is preserved in the Bodleian.

We own that seeing Graf von Baudissin's announcement, we thought for a moment that Dr. Dozy's "original remarks and additions" might possibly refer to that obscure period in the history of Mohammedan Spain. We have been sadly disappointed. With the exception of a few corrections and additions to the *Histoire des Mussulmans*, embodied in the translation, and not easily recognised unless by a most scrupulous and minute comparison

of the French text and German version, there is nothing important added to our store of knowledge on this matter. We are, therefore, inclined to doubt the utility and advantage of a translation from a language so generally spread, as the French is, among German scholars. P. DE GAYANGOS.

NEW NOVELS.

A Rose in June. By Mrs. Oliphant. 2 vols. (London: Hurst & Blackett, 1874.)

Centulle; A Tale of Pau. By Denis Shyne Lawlor. (London: Longmans & Co., 1874.)

Ruling the Roast. By Lady Wood. 3 vols. (London: Chapman & Hall, 1874.)

Seven Years of a Life. (Edinburgh: Edmonston & Douglas, 1874.)

The Sisters Lawless. By the Author of "Rosa Noel." 3 vols. (London: Bentley & Son, 1874.)

Frances. By Mortimer Collins. 3 vols. (London: Hurst & Blackett, 1874.)

MRS. OLIPHANT has written nothing more delicate than *A Rose in June*. Like all of the distinguished women who have risen to eminence in fiction, Mrs. Oliphant has her peculiar mark. Jane Austen's dramatic power, Charlotte Brontë's profound self-consciousness, George Eliot's breadth of culture, Miss Thackeray's simplicity of pathos, are not more characteristic than the quality which underlies the varying forms of Mrs. Oliphant's style. She paints still life with a lightness of touch that is unsurpassed. This is at once her weakness and her strength. The hand which lifted the veil from the homesteads of Carlingford and disclosed a turmoil of passion has lost something of its force if nothing of its cunning. It still sweeps the finer chords of the human instrument with rare skill. But the satire of the *Chronicles* has turned to gentle irony, and the rod to a bunch of flowers. The storm which swept over Salem Chapel has passed away, and the author's pen now loves scenes of repose, loves to linger on the still lawns of a parsonage basking in the noon-tide sun, to wander in downy twilights, or to create sweet and womanly figures. Her latest novel is the story of a summer shower. The Rector of Dinglefield, a man of elegant mind, shrinks from poverty and unlovely cottages, from the worry of bills, cares and the noise of children: chooses rather to sit in the shade of lime-trees, with his feet on a Persian rug: teaches his pretty daughter Rose to adore him, to read poetry to him, and be content to grow richer in the sun, and of a more damask rosiness: and leaves to his curate the charge of the poor and their cottages, and to his wife the duty of paying the bills, bearing the troubles, and stilling the noise of the children. The wife is a woman nobly planned, yet by no means perfect. On her, when the rector dies penniless, falls the burden of maintaining the family. But she is no longer passive. Rose has a poor lover at sea and a rich lover at hand, and Rose's heart is at sea. Her mother determines that the girl shall learn the meaning of self-sacrifice, shall sell herself for the benefit of her brothers and sisters, and she is already engaged to the rich suitor, when her family becomes prosperous

again. Rose, bound by her engagement, throws herself on the mercy of her affianced husband, and he releases her, not without reproaching the mother. It is an idyllic story, but far from faultless. The characters are too fragile, and the gradations of the tale too uneven. There is pathos in it, but not the depth of pathos that was fathomed in Nettie Underwood: there is humour, but not the breadth of humour that played upon Pigeon and Tozer.

There are no other books in the collection worthy of much praise. It is not necessary to judge them by a high standard, since they will be speedily read and speedily forgotten. But Mr. D. S. Lawlor, author of *Centulle, a Tale of Pau*, aspires to be more than a common novelist, and hopes that he has added something new to English fiction. He has added a windy paraphrase of chapters from Murray's *Guide-book to France*. The most eminent teachers of youth have in different ages adopted different modes of imparting instruction. The method of Socrates was to ask questions, that of Mrs. Markham was to answer them. The learning of Plato was expounded in dialogue, that of Mr. Barlow found expression in anecdote. But Mr. Lawlor selects the novel as a field for describing the habits of the Landais, the monuments of Pau, and the geographical features of the Basque countries. He is not altogether responsible for the book. A French friend of his, distinguished as a juriconsult, historian and antiquarian, put into his hands the manuscript of a work which should "add the attractions of a novel to an account of the Pyrenees;" and Mr. Lawlor has brought the manuscript to its present form. There is a curious custom of these parts, called the *couvade*, which resembles this process. M. Francisque Michel in his excellent book on the Basque countries, says that "les femmes se lèvent immédiatement après leurs couches et vaquent aux soins de ménage, pendant que leur mari se met au lit, prend la tendre créature avec lui, et reçoit ainsi les compliments des voisins." The results of Mr. Lawlor's hatching will surprise his readers. They will probably expect an historical romance of the days of Henri IV., or some episode in the lives of Calvin or Béza, or even something in the style of the ribald tales which Bonaventure des Periers is said to have written at the dictation of the most high and excellent lady, Marguerite de Valois. They will find that two young gentlemen of the present day made a sentimental journey on the frontier of France and Spain, and that Proverbial Philosophy wakes responsive echoes even among the peaks of the Pyrenees. They will also find quotations from the Basque language, of which Mr. Lawlor is evidently a student. The language is said to be so difficult that the devil applied himself to it for seven years, and had forgotten his Latin at the end of them. If this story be true, Mr. Lawlor must be remarkably proficient in Basque, for he quotes the well-known Horatian line in the form of "coelum animam non mutat." He gives a few interesting stories and many unnecessary details. The style of the book, for example, would have told us that the people among whom he has lived so long walked on stilts.

Mr. Lawlor's Latin is better than Lady Wood's Greek. A portion of *Ruling the Roast* is written in this language. Dr. Leith, curate of Birchwood-cum-Loame, gave instruction in it to resident pupils, one of whom derived so much advantage that he hoped to be a high wrangler, while another sketched Myra, the Doctor's daughter, and wrote at the foot of the sketch *ὅς οὐδὲς ἴσος*, translated by the author, "None is equal to you." Myra knew Greek too. She understood her father's version of Aeschylus twice as well as his critics, and she corrected bishops when they quoted Plato at the dinner-table. But she did not know English. It was not to be expected that she should be choice in her language, for her father swore, her father's pupils swore, the man who shot at her father swore, her father's son-in-law swore, and the footman of her father's son-in-law swore. Myra did not swear. But she talked slang whenever it was most desirable that she should talk English. She married the second son of the Earl of Arras, and was invited to stay at the house of her father-in-law. She enlivened the dinner-table with a selection of technical phrases culled from various public schools, and in the drawing-room she was good enough to imitate the cries of a duck. She also beat the earl three times at chess. So it is not surprising that Myra and her husband were left to a life of poverty. The book will be valuable to young ladies as showing in the clearest light the misfortunes that spring from an abuse of their mother tongue.

There is a pernicious maxim that most lives have in them the stuff of one novel, and that their sand-laden streams drop a few grains of wisdom as they run. It is mischievous because it misleads the simple-minded. It has misled the author of *Seven Years of a Life*. We are not in a position to deny that she has been acquainted with persons whose doings would fill an interesting volume. These doings may even have taken place within seven years. But they are not the seven years of which the novel tells the history. It is a commonplace account of a commonplace Scotch family. The tiny stream of incidents which trickles down is quite able to submerge the characters. It is impossible to keep them distinct. In fact, much innocent amusement may be afforded to those who have a taste for such pastimes as the game of the thimble and the pea, if they will choose one of the four heroines at the beginning of the book, try to follow her fortunes through the mazes of the story, and say at the end which of the number they selected and what has become of her. There is at first a difference in the colour of the ladies' ribbons, but this clue soon disappears, and the sport becomes exciting.

The school of sensational novelists receives a promising pupil in the author of *The Sisters Lawless*. Its professors have still much to teach her in the art of daubing, but she already works with a juicy brush which threatens havoc to the art of painting. She will probably be placed at first in the lower Ouida form. Her knowledge of grammar saves her from an ignominious position among the Woods and Cudlips,

and her luxuriance of language and wealth of imagery certainly qualify her for the place which we have assigned for her. But there are many difficulties to be overcome, many catalogues of names to be learned, many reports of criminal cases to be studied, before she rises to the eminence of the Braddon class. Her present novel breaks new ground in the region of impossibilities. The sisters Lawless are Canadian girls, who come to live with their uncle in England. Clemence is beautiful and agreeable: Angela beautiful and disagreeable. Clemence has a sweet voice: Angela can speak in low tones, which are terrible as the outpouring of volcanic anger. Clemence has habitually deep Irish grey eyes: Angela's eyes can become blue fire. Clemence spends a regular life: Angela knows moments of moral cyclone. Clemence loves her cousin Bertrand, and is beloved by him: Angela loves her cousin Bertrand, and receives a sort of proposal from him. Angela then discovers the true state of Bertrand's affections, and naturally enough calls him a despicable pendulum, and goes out to meditate revenge with Satanism in her face, while the birds sing joyous epithalamium and jubilate. She has her revenge. Bertrand's gun accidentally discharges itself and kills him, and Angela, who was walking with him, hastily writes on paper words to show that Bertrand had committed suicide for love of her, and lays the paper by his side. It is found, and the handwriting is at once recognised by the family as the handwriting of Bertrand.

Frances is not written in Mr. Mortimer Collins's most culinary vein. The more professional works of Lady Barker and M. Jules Gouffé have recently appeared, and Mr. Collins evidently feels that his glory has departed. There may besome who will regret his descriptions of cutlets served with cucumber, of lobsters and cream, of *rôti de grives* and partridge soup, of capons and devilled turkey's thighs. Such "deipnosophic sages," as their author calls them, will find small comfort in the crisp rashers, creamy eggs, pickled shalots and nut-brown ale of his latest novel. Even the dessert is furnished forth no more. But though the crackers and bonbons are gone, the mottoes are left. There is a personage introduced into the story solely to take charge of this department and serve up the distichs with regularity. He is the good genius of the tale. Wherever there is trouble, thither he carries a soothing verse. Lovelorn maidens, escaped lunatics, distressed railway-guards, Italian counts, "with a touch of the Heautontimoroumenos upon them," he comforts them all with a couplet. But he pours the fullest flood of his poetic sympathy on Hugh Roland, the hero, who is supposed to have murdered Stephen Heath, the villain, both of them being suitors for the hand of Frances Carey, the heroine. There being no evidence to prove or disprove his guilt, Roland is sent to a lunatic asylum. Here he tries to "reduce his fancies and wishes to a state of Nirwana." Failing in this, he escapes from the asylum, becomes a railway guard, buys a field-glass to view from the passing express the daily walks of his love, and by this neglect of duty has an opportunity such as was never before offered

to hero of romance of destroying at a blow all the obnoxious persons of the book. There are four more obnoxious than the rest. The first is a Florentine count who has studied English literature in the writings of Byron and Mr. Cotton, the latter being better known to fame as Mortimer Collins; the second an American lady who has a habit of becoming green when she "assimilates lobster-salad and absorbs champagne;" the third an actress who is thought to be an Arabian Phoenix; and the fourth being Stephen Heath. We are sorry that the amiable author of this novel should be out of temper. He is particularly angry with his critics. We had believed that Mr. Collins was spoiled by his critics who call his style crisp, as he himself calls the bacon, and say that his sentiments are breezy and his heroines ideal. He is even angry with his quills, the quills which have carried him triumphantly through so many reams of rubbish, the quills with whose origin he might have been thought to have sympathy. Perhaps the cause of this displeasure is his desertion from the bill-of-fare style of literature. Rather than see him angry we would counsel him to abandon his new alliance and return to his cutlets. WALTER MACLEANE.

CURRENT THEOLOGY.

The Influence of Christianity upon the Legislation of Constantine the Great. Being the Hulsean Dissertation for the year 1872. By W. Chowner, B.A., Emanuel College. (London: Macmillan & Co.) Mr. Chowner has been careful in collecting facts, and, on the whole, thoughtful in estimating their bearing on his subject; he duly notices that the influence of Stoicism had been at work long before, introducing the conception of humanity for its own sake. And he gives an intelligent view of Constantine fluctuating between the two policies—both recommended to him by sincerely conscientious motives—of universal toleration, and of enforcing a disciplinary uniformity, in worship if not in belief. But if the study of evidence be praiseworthy, the general reflections are rather feeble.

Sacramental Confession. By the Very Rev. John S. Howson, D.D., Dean of Chester. (London: W. Isbister & Co.) This little book (a reproduction of the substance of sermons delivered in Chester Cathedral) is little more than a statement, in refined and tolerably forcible language, of the common popular objections to the doctrine or practice discussed; only the author shows that he knows more than is common of the data required for discussing it.

Protestantism: its Ultimate Principle. By R. W. Dale, M.A. (Hodder & Stoughton.) Mr. Dale thinks that Protestantism is losing its hold on the English nation, and in a lecture to a Young Men's Christian Association he recalls to mind its "fundamental principle," or rather, explains the nature and unity of its three fundamental principles. "The right of private judgment for which Protestantism contends is neither the right to doubt, nor the right to 'think as we please.' It is the right to listen to God when God speaks to us." "Protestantism, according to its fundamental principle, does not accept the truth of the teaching of Holy Scripture merely because it acknowledges the authority of Holy Scripture; it would be more accurate to say that it acknowledges the authority of Holy Scripture because it accepts the truth of its teaching." This, he says not untruly, was the state of mind of the Reformers; and he confesses it has not been equally that of their followers. But it is surely too much to assert that to the spiritually-minded believer the Bible ceases to be

an external power. Finally, after stating in its best form the doctrine of justification by faith, he says, "The doctrine, when the life passes out of it, becomes not immoral but powerless." These three passages sum up the doctrinal teaching of the book. It is highly honourable to its author that he goes out of his way to protest against the Prussian persecution of Catholicism.

Christianity in Great Britain has rather too ambitious a title: it is a reprint of five articles in the *Daily Telegraph* on the principal religious denominations of the day. Some care has been taken to give a fair and sympathetic account of each, and the result is just about as good as might be expected.

The World and the Sects; or the Charge of the Lord Bishop of Bath and Wells examined. By J. Stewart McCorry, D.D. (London: Burns & Oates.) Dr. McCorry has written at least three dozen pamphlets without learning to write: the only interest (if any) of his last is that he is more conciliatory than most Romanists towards Anglican aspirations for "Reunion."

Facta non Verba, a Comparison between Catholic and Protestant Charity in England. By the Author of "Contrasts." (London: W. Isbister & Co.) *Contrasts*, a statistical work on charitable and legal relief in London, seems to have commanded some attention, and gained the author a reputation for practical good sense. This reputation has now encouraged him (or her?) to publish another book that will not add to it. One term of the comparison professed to be drawn is omitted: we only find that the writer visited one or two convent infirmaries, and didn't like the looks of them. On the other side, we have an account of the admirable philanthropic labours of eleven ladies, of whom the majority are still living, of whom one is or was a Jewess, one a Unitarian, one a Quaker, and the rest "orthodox" Protestants of various denominations.

Faith Work, or the Labours of Dr. Cullis in Boston. By the Rev. W. E. Boardman. (London: W. Isbister & Co.) This is as ill-composed as a book can be, but derives interest from its subject—an account of the foundation of a Home for Consumptive Patients, to be maintained "on faith," like the celebrated Orphanage of Franke and Müller. Dr. Cullis's own character before his conversion and the commencement of his work, is far more interesting and estimable than Müller's; and apparently he is less responsible than Mr. Boardman for the faults of taste and defects of reticence that strike an Englishman in the book.

Cheerful Words, Sermons specially adapted for delivery before inmates of Lunatic Asylums, Unions, Hospitals, Gaols, &c. Edited by William Hyslop, Proprietor of Stretton House Private Asylum. (London: Baillière, Tyndall, & Cox.) Mr. Hyslop has a sensible Preface on the sort of religious instruction adapted for the insane; it may be doubted whether the same would be suitable for all the classes of audience he contemplates. The sermons themselves are of very unequal merit: one, the twenty-third, is really thoughtful; several are pious, and might be thought meritorious, at least if the language were a little chastened; and some are utterly commonplace. The volume is dedicated to Lord Shaftesbury, which indicates its theological tone; but with one exception the promise of the Preface to avoid controversy is kept.

Divine Revelation, or Pseudo-Science? an Essay. By R. G. Suckling Browne, B.D. (London: Longmans & Co., 1874.) Mr. Suckling Browne seems to have got hold of some facts showing that the physiological differences between Europeans and Australian aborigines have been overstated by some anthropologists of repute. Otherwise his book is as stupid and ignorant as it well can be. Let us hope that the work "on the Origin of Language," to which this is a "pilot balloon,"

may never appear; for even here he finds opportunity to prove its worthlessness beforehand.

Restoration of Household Communion (Elliot Stock). This work is anonymous, but refers to an earlier one of the author, which one is tempted to identify with that of Mr. Henry Dunn on "The Churches." At any rate, the peculiar views expressed are nearly the same as in that book; this is smaller, and perhaps shows more acuteness of observation on the evils of the present state of the religious world.

The Second Death and the Restitution of all Things. By Andrew Jukes. Third Edition. (London: Longmans & Co.) The success of this book is mainly to be ascribed to the author having (quite unconsciously) adjusted his doctrinal innovations to the public taste for a flavour of naughtiness. His "Preliminary Remarks on the Nature and Inspiration of Holy Scripture" are as orthodox as can be; but they are put forward in a tone of deprecating modesty combined with resolute truth-speaking, that makes a reader think that a cherished prejudice is being dispelled, when a pious commonplace is put in a new and edifying form. Then, with many apologies and professions of diffidence, one doctrine of the popular creed, which seems likely to disappear from it, is selected for attack: the arguments, scriptural, patristic, and *à priori*, for rejecting it are stated; and the mass of people who are aware that such arguments exist, and give them in their own minds more or less weight, are glad to have them stated in a handy and, on the whole, scholarly form.

The History of the Creeds. By J. Rawson Lumby, B.D. (London: Deighton, Bell & Co.) Mr. Lumby pretends to no original research, and his work has most of the merits appropriate to one without such pretensions. In the history of the so-called Nicene and Apostles' Creeds there is little to be desired. But he has not altogether avoided the common fault of admitting popular preconceptions into the scientific enquiry into matters of fact; on the one hand, he is (in common, to be sure, with most orthodox divines, at least in England) over hasty in assuming that the outlines of the Christian religion given by Irenaeus and Tertullian are taken by them from baptismal formulas: on the other, after reproducing entirely Mr. Ffoulkes' view of the very late origin of the Athanasian Creed, he goes into a rather irrelevant discussion as to the propriety of its liturgical use in the contemporary English Church.

Manuals of Religious Instruction for Pupil Teachers. Edited by Canon J. P. Norris. (London: Rivingtons.) There is to be a series of these Manuals on the Prayer-Book and the Old and New Testament: the first part of each has now appeared. That on the Morning and Evening Prayer, by the Editor, is very good for its purpose. Mr. E. J. Gregory's, on the Pentateuch, might be useful to a sensible but not learned clergyman or schoolmaster to teach from, but the learner could derive little benefit from having it in his own hands. Mr. Winter, on St. Matthew's Gospel, dabbles in the picturesque: here, even the unlearned clergyman had better get his information direct out of Alford or Trench, and arrange it for himself to suit his pupils' requirements.

MR. HENRY MORRIS wisely reprints, instead of paraphrasing, *The Books of Genesis and Exodus, with Analysis and Notes, for the use of Candidates for the Cambridge Local Examinations.* (London: Longmans & Co.) He is far more successful in reproducing, still more in arranging, the sort of information that is to be found in the *Speaker's Commentary* and the *Dictionary of the Bible*.

Hymns of Praise and Prayer. Collected and edited by James Martineau, LL.D. (London: Longmans & Co.) One half the world does not know how the other half lives, and the same

is the case with sections much smaller than half of bodies much smaller than the world. Dr. Martineau seems to think that the religion of the future is a devout and distinctively Christian Unitarianism; that public worship, and singing of hymns therein, will survive the belief that Christ can be invoked by more than a rhetorical or poetical apostrophe; and he endeavours, at the expense of some violence to his own conservative sympathies, to adapt the best English hymns to the use of such congregations as he expects to arise and to multiply. These views and this aim are set forth in a Preface worthy of its author; but the collection, judged as a hymn-book, will hardly add to his fame. It is very much too large—containing nearly 800 pieces; of which far too few are relegated to the appendix of "Pieces not adapted to Music." One need not be as severe as Mr. M. Arnold on English devotional poetry to say that there are not 700 good hymns in the language. And while nearly all the hymns in existence have been the work of Trinitarians and believers in miracles, it is clearly only very good ones that will stand the violence, or repay the trouble, of adaptation to Unitarian sentiments. There can, indeed, be little doubt that Dr. Martineau is right in his bold avowal that a hymn is not to be treated as a documentary text, to be preserved as its author left it, but as the utterance of a community, gradually to be shaped by them till it precisely expresses their sentiments. But the sentiments of a community must be at bottom identical with those of the author, if his words, however modified, are to be worth retaining as a vehicle for their utterance. Dr. Martineau rightly sets aside the proposal to nourish the religious sense on "Vedic hymns or Gentile metaphysics;" but to the holders of a creed different from that of historical Christendom, distinctively Christian devotions will be incompatible in only a less degree. If a new vital religion is to appear among us, it will create a new devotional literature of its own: it will not necessarily refuse to profit from the old, but it will select from it what it can assimilate rather than formally excise what it cannot. A Christian can derive some edification from Aeschylus or Vasishtha, or at least reads them sympathetically; but he does not ask for an edition with the paganism expurgated. Protestants have certainly not diminished their devotional use of the *De Imitatione*, but they have grown ashamed to mutilate it for their use. It is certain that no Theist or Unitarian mourner need be ashamed to find comfort in the 11th chapter of St. John, but no one will rewrite it for the purpose; and though it is quite possible that he might continue to value "When our heads are bowed with woe" (at least if he had been reared in a creed where it was in place), if he does, he will use it as Milman left it. Dr. Martineau's alterations serve only to shock old sympathies, and call attention to incongruities.

Songs of Consolation. By Isa Craig Knox. (London: Macmillan & Co.) Mrs. Craig Knox's *Songs* are all pious, most in fairly harmonious verse, some thoughtful enough to be edifying: two, "Risen" and "The Mercy Seat," are not wholly without poetical interest.

A Simple Way to Pray. By Martin Luther. Second Edition. (London: W. Wesley.) Luther's letter on Prayer is well worth popularising, and this translation is made with appreciation of the racy vigour of both thought and style; though, in attempting to reproduce it, "S. W. S." falls short of the scholarly felicity which Miss Winkworth's similar works have proved not to be unattainable.

Unsectarian Family Prayers. By the Rev. H. R. Haweis. (London: Henry S. King & Co.) Mr. Haweis, "Family Prayers" are not, and could not well be, more "unsectarian" than most ordinary manuals of the sort, and do not differ from them except by some clauses that a new servant

would think were personal till she found they came every week. In reverence and style, however, they are better than many.

A Book of Meditations. By the Rev. Edward Collett. (Bemrose & Sons.) Mr. Collett's "Meditations" are noticeable for the combination—which, if often existing, rarely finds its way into literary expression—of intense and sometimes passionate fervour of emotion, with opinions of the sober, old-fashioned Anglican type. The language is now and then rather less elevated than the sense deserves; and many people would be shocked at the second meditation on Hell; but here the question is one of doctrine and not of taste.

Every Day a Portion. By Lady Mary Vyner. (London: Henry S. King & Co.) It seems cruel to judge by a literary standard the devotions of a devout widow; but, instead of publishing *Every Day a Portion*, it would have been easier to leave other devout widows to make their own cents from the Bible, the Prayer Book, and Keble, and interpolate in them their own personal sorrows and anxieties.

The Prayer Book, with Scripture Proofs and Historical Notes. By A. Theodore Wigram. (Bemrose & Sons.) The "Scripture Proofs" from that sound Protestant text-book, *The Liturgy compared with the Bible*, the "Historical Notes" from Blunt, Proctor, and other "Catholic" sources; the result is odd.

Catholic Sermons. Vol. I. (Longley.) This is the first instalment of a series of discourses by eminent ministers of various denominations; the best-known contributors to this volume are Newman Hall, Morley Punshon, and Dean Stanley.

EDITOR.

NOTES AND NEWS.

MR. GUDBRAND VIGFUSSON, who is at present in Sweden, has discovered among the MSS. of the University Library at Upsala, a previously unknown perfect copy of the *Orkneyarsaga*, which hitherto has been known only as containing various lacunae; these are now all filled up. The newly-discovered passages of the Saga, one of which is described as being of peculiar interest as giving a unique sketch of the fisher-life of primitive Scandinavia, will be brought to England, and published here by Mr. Vigfusson.

PROFESSOR PAUL MEYER has just been making his regular autumn visit to the Old French manuscripts in the British Museum, Cambridge, and Oxford libraries.

DR. ZUPITZA, of Vienna, will be in town shortly to continue here the copying of the manuscripts of the old romance of *Guy of Warwick*, on which he has been engaged lately in Scotland and at Cambridge.

It is expected that the volumes to be published in the "International Scientific Series" during the coming season will be Professor Marey's "Animal Mechanism;" Dr. Hermann Vogel, on the "Chemistry of Light and Photography," which will be profusely illustrated; Professor Oscar Schmidt, on the "Doctrine of Descent and Darwinism;" Professor Lommel on "Optics;" and Dr. Van Beneden, on "Parasites in the Animal Kingdom."

PROFESSOR MARCH, of the United States, proposes to bring out parallel-text editions of the best Anglo-Saxon versions of Boethius and Orosius, with their Latin originals.

The Life and Unpublished Works of Samuel Lover, edited by Bayle Bernard, will be published by Messrs. Henry S. King and Co. during the autumn. The same firm will issue the *Autobiography and other Memorials of Mrs. Gilbert*, formerly Ann Taylor (well known as the author of *Hymns for Infant Minds*), edited by Josiah Gilbert, the author of *Cadore and Titian*

Country; A Memoir of Dr. Rowland Williams with Selections from his Note Books and Correspondence, edited by his wife; and the *Autobiography of Dr. A. B. Granville*, who for a great number of years enjoyed a physician's practice which brought him in contact with most of the prominent men of his day—the volumes are edited by his daughter, Miss Paulina B. Granville.

MR. J. E. BAILEY'S *Life of Thomas Fuller*, which we have already mentioned, will be published on October 5 by Mr. Basil Montagu Pickering. The present life differs from its predecessors in being for the most part autobiographic. Copious extracts are given from some of Fuller's less known or unique productions; and some of his scarcest works and various literary rarities with which he is connected are given *verbatim*. All sources of information have been carefully examined, including parochial and episcopal registers, documents at the State Paper Office, the British Museum, Bodleian, &c., besides allusions to contemporary literature; and particular care has been taken to show the part which Fuller played in the Convocation of 1640, in the defence of Basing House and Exeter, and during the Commonwealth and Restoration periods. Mr. J. E. Bailey also gives a detailed criticism of the author's various works with bibliographical details, and has added from out-of-the-way sources lengthy particulars of Fuller's kinsmen. The book will form one volume octavo of about 820 pages, and the price will be twenty-five shillings.

The Life of Captain Joseph Fry, one of the executed captives taken from the *Virginias*, off Cuba, has been written, from materials in the possession of his widow and friends, by Mrs. J. Mort-Walker, and is in the press at New Orleans.

WE are informed that a work by Mr. J. R. Morell, entitled *Euclid Simplified in Method and Language*—a manual of Geometry on the French system—will shortly be published by Messrs. Henry S. King and Co. The chief features of the work are the separation of theorems and problems: the natural sequence of reasoning areas being treated by themselves, and at a later page; the simpler and more natural treatment of ratio; the legitimate use of arithmetical applications of transposition and superposition; and the general alteration of language to a more modern form. Lastly, if it be assumed to be venturesome to supersede the time-hallowed pages of *Euclid*, it may be urged that the attempt is made under the shelter of very high authorities.

WE understand that a new and revised edition of the first volume of Mr. F. O. Adams's *History of Japan*, which was favourably noticed in these columns some months ago, is now in the press. As we have already stated, the second volume, completing the work, will be published during the autumn.

A TRANSLATION of Heine's poems from the German, a new rendering of Goethe into English verse, and a collection of legends illustrating the history of Old Louisiana, are in progress under the hand of Mrs. Marie Bushnell Williams, of Opelousas, a lady whom Miss Raymond, in her critical biographies of "Southland Writers," describes as the most learned woman in America.

THE work on the origin of the Independents, upon which the Rev. Henry Martyn Dexter, D.D., of Boston, editor of the *Congregationalist*, has for three years past been engaged, rapidly approaches completion. It will be published in England and America simultaneously.

AMONG Messrs. Longmans' forthcoming publications are a *Journey up the Nile*, by Miss Amelia B. Edwards, and an account of Isaac Casaubon, by the Rev. Mark Pattison, Rector of Lincoln College, Oxford.

THE Wesleyan missionaries in Ceylon are reprinting the articles on Buddhism contributed by Gogerly to the *Journal of the Ceylon Branch of*

the Royal Asiatic Society and other periodicals, and they promise to add to the series of his known writings some of the papers left by him in manuscript. Unfortunately their *modus operandi* is such that the reprint will bring little or no advantage to European scholars. The vehicle for the reproduction of these celebrated essays is the *Friend*, a monthly magazine printed at Colombo. Not to dwell upon the fact that the *Friend* is almost wholly unknown in Europe, the essays are broken up to suit the requirements of space to such an extent that the first * (the only one as yet reprinted) is actually spread over five monthly numbers! It is bad enough that the Ceylon Wesleyan missionaries, who are the trustees of Gogery's literary remains, should have allowed so many years to pass without an attempt to edit his essays; it is far worse that they should make use of them to eke out the scanty columns of a religious serial. It is to be hoped that they will be well advised enough to abandon their present course, and devote their energies to doing for Gogery what has been more than once done for Colebrooke. They could pay no fitter or more sincere tribute to the memory of that great pioneer of Buddhist learning than by furnishing scholars with a faithful and well-edited reprint of his essays.

THOUGH the Early English Text Society has already spent on its "Reprints," or new editions of the Texts it issued in 1864 and 1865, 264 more than the subscribers to these Reprints have paid, yet the committee have now in the press for this series, new editions—by Mr. Wheatley, of the first part of his unique *Merlin* from the Camb. Univ. MS., and by Mr. Furnivall of *Thynne's Animalversions on Speght's Chaucer*, from his autograph MS. in the Ellesmere Library. These the committee intend to ask the general subscribers to the Society to give to the "Reprint" subscribers in excess of their subscription, and then see whether the Reprint men will make any further effort to complete the reproduction of the issue of 1860.

THE Early English Text Society's prize at Lafayette College, Easton, United States, has been adjudged by the examiners, Professor F. A. March and Professor A. A. Bloombergh, to Mr. Herbert H. Jackson, with honourable mention of Messrs. M. Evans and W. E. Thomas. Mr. Jackson is blind. He studies by an assistant, who reads to him and writes for him. He prepared for college, and is taking a full classical course in this way, and he stands high in all departments, though the class is a very good one. Mr. Jackson is very fond of phonetics, and means to complete his philological studies in Germany, after he has taken his degrees at Lafayette College.

THE New Shakspeare Society will open its second session on Friday, October 9, with a paper on "The Politics of Shakspeare's Historical Plays," by Mr. Richard Simpson, in continuation of his former paper in July last, on "The Political Use of the Stage in Shakspeare's Time." The second paper, on November 13, will be by Professor Ingram, LL.D., of Trinity College, Dublin, on "The 'Weak Endings' of Shakspeare in relation to the Succession of his Plays." It was hoped that the third paper, on December 11, would have been by Professor Leo, Ph.D., of Berlin, but the Professor's tour in Germany and Switzerland has necessitated the postponement of his paper; and the December evening will probably be given to one of the "scratch" nights which the committee last season determined to have—a discussion of the play of *Cymbeline*, to be opened either by Mr. Hales or by Mr. Furnivall. One of the papers promised for next session is "On Shakspeare's Quibbles," by Mrs. F. C. N. Hall, a daughter of Mr. J. O. Halliwell.

MESSRS. HENRY S. KING AND CO. are preparing for the winter publication an illustrated book for

boys by David Ker, the author of *On the Road to Khiva*, entitled *The Boy Slave in Bokhara*, a tale of Central Asia; and they will also publish two illustrated books for girls, entitled *Waking and Working; or, from Girlhood to Womanhood*, by Mrs. G. S. Reaney; and *Aunt Mary's Bran Pie*, by the author of *When I was a Little Girl, St. Olave's*, &c.

THE same publishers have in preparation for the forthcoming autumn and winter seasons, a volume of poems by Augustus Taylor, another by Allison Hughes entitled *Penelope* and other poems, and *On the North Wind Thistledown*, a volume of poems by the Hon. Mrs. Wilmoughby. A second edition of *The Disciples*, by Mrs. Hamilton King, with some notes and corrections, is also about to be issued.

AMONG the theological works to be published by Messrs. Henry S. King & Co., we may mention a new volume of *Sermons*, by the Rev. Stopford A. Brooke; *Sermons and Expositions*, by the Rev. Rayner Winterbotham, which have been preached for the most part to Australian congregations; a volume of sermons by the late Rev. Henry Christopherson, who was for some time assistant minister at Trinity Church, Brighton; and the *Curate of Shyre*, by the Rev. Charles Anderson, which is published as a record of parish reform, and attempts to present its attendant religious and social problems.

IN the "silly season," it appears, a German poet's fancy lightly turns to thoughts of Bismarck. At all events, we are flooded this autumn with laudatory verses, extolling the virtues and prowess of that statesman. Among the Prince's voluntary laureates, two distinguished names stand prominently forward: Emanuel Geibel and Julius Rodenberg have each perpetrated an Ode. The first is in *alcaics*, and is more pompous than imposing; the second, a dactylic effusion, is lively, but not dignified. At Dortmund, we learn, a committee has offered a prize of 1,000 thalers for the best "Hymn to Bismarck." The sonnets of Redwitz are completely put in the shade by this outburst of lyrical enthusiasm.

AMONG the Syriac MSS. in the Ambrosian Library at Milan, one of the most venerable is a copy of the Peshito version of the Old Testament, which may be assigned to a period as remote as the sixth century. This Syriac version is, next to the Greek, the oldest and most important. The publication of so ancient a MS., therefore, cannot fail to be of interest to Biblical and other scholars; and it is proposed to reproduce it in facsimile by means of photolithography, under the direction of the Rev. Dr. A. Ceriani, the chief librarian of the Ambrosian, whose experience in work of this description is already well known. The edition will be in two volumes folio, and will consist of 660 photographed pages and about 60 pages of letterpress. The entire cost is estimated at 1,200*l.*, and the subscription price for a single copy is 10*l.* The sum of 297*l.* has already been promised in donations and subscriptions, and it is hoped that a sufficient number of subscribers' names will be forthwith obtained to begin the work.

Subscribers should send their names to Professor W. Wright, St. Andrews, Station Road, Cambridge, who will supply any further information which may be required.

By the recent death at Zittau of Herr Heinrich Moriz Horn, Germany has lost a litterateur of considerable merit. Horn is, perhaps, best known by his earliest poem, "The Pilgrimage of the Rose," which was set to music by R. Schumann, but many of his later productions are of far greater merit, as his "Lilie vom See," "Magdala," and the "Village Grandmother." It is chiefly as a writer of lyrics and epics that Horn will be remembered, for his numerous prose writings are inferior to his poems. He was an industrious dramatic writer, and wrote several original pieces, besides adapting numerous French plays for repre-

sentation at the theatre at Chemnitz, his native town, where through his means a dramatic association was formed for the better cultivation of the art. Horn, who was in his sixtieth year at the time of his death, graduated at Leipzig in 1836, and after studying law at Dresden, he ultimately obtained the office of assessor to the Judicial Court at Zittau, but owing to his literary pursuits his connexion with the legal profession was rather nominal than real.

THE town of Eisenach has presented to the widow of Fritz Reuter, in perpetuity and free of all charges, the piece of ground in the new cemetery where the poet has been buried. And as we learn Frau Reuter has commissioned Herr Afinger, who had made an admirable bust of the poet, to execute a monument to be erected over the spot that shall be worthy of the reputation of the deceased.

A GROUP of distinguished men, in the centre of which is Césaire Cantù, have recently organised in Milan a Lombard Historical Society. An historical library is projected, and the undertaking has already given proof of serious work in the first number of a quarterly review bearing the name of *Archivio Storico Lombardo, Giornale della Società Storica Lombarda*. The Society is greeted with enthusiasm by the French Academy of the Political and Moral Sciences.

PROFESSOR KOTLIAREVSKY, of the University of Dorpat, has just published, in the *Prague Museum Review*, an account, in the Bohemian language, of the results of all the work, whether historical, ethnographical, or philological, relating to the Slave element, which has been done in Russia between 1860 and 1872. It is the sequel to an analogous study which another Russian professor, M. Lavrovsky, published through the same medium in 1860. M. Kotliarevsky is one of the best exponents of this branch of research. He has already published an excellent work on the funeral rites of the Slaves, and is at this moment occupied with a History of the Slaves of the Elbe, which is expected to appear in Prague shortly.

THE usual centenary festivities in honour of Ariosto at Ferrara are postponed till next spring.

J. MILSAND, whose name will be known to Mr. Browning's readers, contributes a paper to the *Revue des Deux Mondes* for September, on "England in 1874," which is a curious example of the limitations of the aphorism that lookers-on see most of the game. He thinks that England has altered much more than France in the course of the century, that our Constitution was finally disorganised by Mr. Disraeli's Reform Bill and Mr. Forster's Ballot Bill; he seems to imagine that the last made it somehow easier for the publicans to discard their political professions in favour of their class interests, which is surprising, as they all placarded their candidates in their windows. In general, he is much impressed by the first of Mr. Greg's rocks ahead. He is also much impressed by the third, all the more that he regards Mr. Lecky as altogether a fellow-labourer with Buckle, and Professor Owen as altogether a fellow-labourer with Mr. Darwin. Perhaps he would be in some measure reassured if he had studied Mr. Herbert Spencer's introductory work on Sociology sufficiently in detail to recognise that a writer who in his judgment represents the culmination of the dominant tendencies of English thought, has anticipated his view of the future function of religion as the guardian of the moral tradition which must continue to guide those who are not ripe for independent thought. Though the article is pleasant and entertaining, it suggests that a writer may be disinterested without being trustworthy, and intelligent without being fruitful.

FATHER THEINER, whose researches and publications made him the greatest foe the Jesuits ever had, never was a member of that order, as certain of the German papers have alleged. He was a member of the Congregation of the Oratory, to

* From the *Journal of the Ceylon Branch of the Royal Asiatic Society*, 1845.

which Baronius before him had belonged, and to which Père Gratry in France, and Dr. Newman in England, have attached themselves. Although Gregory XVI., who knew him as a friend and valued him for his learning and catholic thoroughness, designed appointing him Prefect of the Vatican Archives, it was Pius IX. who actually gave him the post.

It seems that although he left very considerable literary remains, not much can be expected of them; for, notwithstanding the intensest provocation, he never betrayed the confidence of the Pope by making even a note of documents which might compromise the Papacy. Thus his published works are in many respects visibly imperfect, and there is reason to believe that the MSS. he has left behind him will not fill up the *lacunae*.

The suppression, at the instigation of the Jesuits, of the "Order of Business" of the Council of Trent, which Theiner printed from Mascarelli's manuscript in the Vatican, has now become matter of history. But it is not so generally known that copies of this print were obtained by Bishop Hefele, Professor Friedrich, and some others, before the sudden order for the destruction of the copies was issued.

Moreover, a work on the Acts of the Council of Trent, which in the manuscript Theiner took with him to Agram on his last journey thither, will in all probability make its appearance within twelve months.

THE following extracts from an original unpublished letter, dated August 22, 1715, a few months before the landing of the Old Pretender, have been sent to us for publication, as an illustration of Oxford Jacobitism in those days:—

"I hope I shan't be thought troublesome in giving you an Account of some Actions committed in Oxford during the few hours I stayed there in my Journey to my Quarters. I had noe sooner arrived there but I found some Officers a Recruiting there, one of my Lord Orrery's Regiment and another of Col. Pocock's—wee soone fell into Conversation and they were surprized at the disaffection that that City shewed to King George for noe sooner did the Sergeant mention the words of all Gentlemen that have a mind to serve his Majesty King George, but he was assaulted by some of the Students & Townsmen by dirt stones & other things being flung in his face, this usage was as often repeated as the sergeant made his proclamation. I went into the Towne with them & as soone as wee were perceived the General & common Cry of the Gownsmen & Townsmen was 'Downe with the Roundheads, Downe with Marlborough—Bullingbrooke & Ormond for ever,' and then the song of the King shall enjoy his owne againe was publickly & loudly sung. I being pretty well knowne in the Towne a party of Rascalls planted in a Ground Rooome belonging to the King's Head Tavern, as I was going by, with a loud voice cried out 'Downe with the Roundheads, Downe with Marlborough,' thrusting their heads to the window that they might be heard the plainer. I not caring for an Invitation into their Company rushed into the Rooome (the Ringleader manfully running away) and I then asked who was the Villaine that used those expressions. The poor Rascalls denied that they mentioned any such words, and begged for mercy often. I had a friend with me who would have partaken in the affair had the poor Dogs had courage enough to have oppos'd us. I left them with as many hard curses as my ill nature at that time could afford them. . . . They drink the Pretender's health here by the name of James the Third as frequently as Loyal Men drinke King George. . . . I accidentally happened into the company of a Fellow of Jesus College, a man of a very honest good character, and I speaking and mentioning to him the villenese and villainy of the Clergy there, he shook his head and said he was sorry at it. I took courage from thence to ask his opinion how the University in general stood affected to his majesty King George and the succession. He was unwilling to answer me, but pressing him, he replied that he was very well satisfied that above two thirds of the University were disaffected to King George and the succession; he is a man of a long standing there and perfectly acquainted with the disposition of that Body.

What I have here related is literally true, & occur'd the few hours I was there. I was glad to gett out of the vile Jacobite place."

In anticipation of the history of Soho and its Square, which we suppose will be published when the said Square has been regenerated after the manner of its fellow in old Leicester Fields, we give here a note of some early allusions to the district, which we believe have not yet been made public. The late Mr. Hunter, the eminent antiquary, had a theory on the origin of the name, which he has recorded in one of his manuscripts, something to the following effect:—

"Soho is one of many hunting cries, and has been so from a very remote period: for on the seal of one of the old family of Denby of Denby, co. York, temp. Edward II., we have the singular device of a hare sitting astride on a hound and blowing a trumpet with the word 'Sohou!' This seal is tricked in Harleian MS. 6070. Thus the name suggests that there may have been a noted pack of hounds kept within the limits of the district now known as Soho."

The earliest allusion which the same authority had discovered was in an assessment levied on "persons living 15 Charles I. at or above Charing Cross, St. James, Pickadilla, So-ho, the Mews, and part of St. Martin's Lane," &c. Among the State papers, however, dated August, 1634, that is, about five years previous to this, is a form of indenture of lease intended to be granted by Francis, Earl of Bedford, William, Earl of Salisbury, Sir Edward Wardour, and Sir Oliver Nicholas, "of one watercourse of spring water coming and arising from a place called Sohowe, running in one small branch or pipe of lead through one small cock of brass stamped with the common mark of the lessors, and placed in the dwelling place of the lessee." Attached to it is a covenant by the lessors that the said branch shall every day, except on the Sabbath day, be stored with water from six o'clock in the forenoon till five in the afternoon, and that if the water shall not continue to bear soap fit for washing clothes by the space of one whole year, the lessee may surrender his lease. Wardour Street, with Edward Street running out of it, it is worth while to notice, still commemorates the existence of one person named in the above-quoted document. In a petition presented by Jane Hathaway to the Earl of Manchester, dated June, 1637, there is a reference to some tenements in Soho which stand in need of repairs. From the Royalist Composition Papers in the Record Office we learn that Joane West, of the parish of St. Martin's in the Fields, widow of Thomas West, deceased, a delinquent, held jointly with her husband a lease in 1645 of "certain messuages and tenements lying in a certain place called Soehoe in St. Martins in the field, of the clear yearly value before these troubles, 6*l*." of "one Mr. Poultney of St. James." Thomas West, it is interesting to ascertain from his widow's petition, had been "servant to his majesty as yeoman purveyor for fuel," and she a "poor gentlewoman" whose "husband hath left 900*l*. debts, and nothing to pay it withal." The present Great Pulteney Street is called "Poultney" Street in the map of St. James's parish, published in the 1755 edition of Stow's *Survey of Westminster*. From the above-named papers we also gather, that in 1651 Abel Wingfield, of the same parish, another "delinquent," declares himself possessed of a lease for five years yet to run of "a tenement, orchard and backside in Soho" worth 2*l*. per annum above the rent he pays.

HERR HERMANN GRIMM, in the July number of the *Preussische Jahrbücher*, gives a literal translation of a hitherto unprinted Latin letter, addressed to Pope Leo X. in the year 1521, and deposited, together with many other documents of a similar character, in the archives of the Corsini Palace at Florence, where it was seen last year by Herr Grimm, and copied by him with the permission of the librarian.

In this letter, which begins as follows, "Bea-

tissime Pater, Post pedom (sic) oscula post Debitas Commendationes," the unknown writer, who is conjectured to have been one of Raphael's scholars, goes on, after some preliminary remarks, to inform his Holiness that he has completed twenty cartoons for twenty pieces of hangings, which are to adorn the hall then being painted by his comrades, Giulio (Romano) and Giovanni Francesco (Penni). He assures Leo that more beautiful *spalere* (coverings) could nowhere be seen, since they are richly ornamented with gold, and with merry designs of sportive children and all manner of joy-inspiring things intermingled with his special emblems. The writer at the same time promises soon to begin the bed-hangings, which are, according to directions, to be embellished with the picture of his Holiness receiving from God the Grace of the Holy Spirit, and with likenesses of the Mon-signori de' Medici and Cibo. For these heads he begs to be allowed to make copies on a reduced scale of the portraits which were painted in oils by his master in a large picture, then at Florence, in the possession of Monsignore de' Medici, and he laments that, in consequence of the inattention which his request has hitherto met with, he has been unable to finish the bed. After begging the Pope to intercede for him that he may obtain the small monthly payment of a ducat, due to him for his discharge of the duties of a humble charge given to him by Monsignore Medici, whilst he was in the service of his Holiness, he goes on to say a good word for his own master, whose great industry he commends, while he deprecates the awkwardness and incapacity of the "remote barbarous foreigners," whom he is forced to employ, and complains of all that he has had to suffer at their hands.

In considering the questions who wrote this letter, and which one of Raphael's pupils had a commission to paint hangings and design cartoons for Leo X., Herr Grimm advances the opinion that in this anonymous writer we may recognise Tommaso Vincidoro, of Bologna, who is spoken of by Albrecht Dürer in his journal (May, 1521) as an Italian painter, named Thomas Polonier. In support of his hypothesis he refers to a letter of Leo's (printed by Pinchart in the *Bull. de l'Acad. Roy. de Belgique*, 1865), which bears the date May 21, 1520, and authorises Tommaso to travel "in nonnullas Flandriae partes pro quibusdam nostris negociis." Furthermore, he has found in the MS. notes of the painter Francesco d'Olanda, appended to a copy of Vasari (1568), which was discovered at Madrid by Raczyński, a notice that Tommaso had been commissioned to superintend the execution of hangings, which were being woven in the Low Countries for the Pope from drawings by Raphael. But although these notices may decide the question of the identity of the writer of the letter, they do not enlighten us as to the nature of the cartoons themselves. According to Passavant two sets of hangings were made for Leo X. in the Low Countries from cartoons by Raphael, or his pupils; but as the first of these is believed to have been completed before the year 1519, and the second is described as illustrating the Acts of the Apostles, and not exclusively from original drawings of Raphael, they seem both to be placed beyond consideration. From the reference to the "sportive children" and the emblems of the Medici, which adorned the *spalere* spoken of in the letter, Herr Grimm is led to conjecture that they may be the cartoons included by Passavant under the head of "tappezzerie del Papa," and ascribed by him to Giovanni da Udine. He thinks, moreover, that in the so-called "sportive children" we have a series of illustrations of the "Gods of Love" of Philostratus, and although amorette had usurped the places of the older typical angels in Raphael's pictures before he could have followed Philostratus, the question of how far the latter influenced Roman and Venetian art in the sixteenth century is one that deserves attention. Hence the vague reference in the

Corsini letter to cartoons from the great painter's school, which were to derive their chief attraction from the pictures of sportive children, is not without interest, especially in its connexion with Leo, who ranked among the best, as well as the most exalted, art connoisseurs of his times.

NOTES OF TRAVEL.

LIEUTENANT CLAUDE REIGNIER CONDER, the Royal Engineer officer in command of the Ordnance Survey of Palestine, is now on his return to the Holy Land. Lieutenant Conder's health has suffered much from overwork and the malaria of the valley of the Jordan. An outbreak of the malady known as the Jericho fever prostrated the greater part of the members of the expedition, and terminated fatally for one of them. It might have put a stop to the survey altogether, but for the prompt measures taken by the commanding officer, and the skill and unwearied care of Dr. Chaplin, the English physician at Jerusalem. Lieutenant Conder returns to Palestine with health much restored by change of climate, although he was unable to be present at the reading of his paper on the Topography of Syria at the meeting of the British Association at Belfast. Arrangements are in progress for adding to Lieutenant Conder's staff; and if these are successfully carried out, there is good reason to expect the completion of the survey within two years from the present time.

It should be known that the production of a map of Palestine on the scale and method of the Ordnance map of England, although the primary object of the expedition, is only a portion of the work this officer has in hand. Every village, building, spring, road, or noticeable object is carefully examined and noted in the survey books. Plans to an enlarged scale, photographs, and water-colour drawings of all ancient buildings, relics, or inscriptions are made during the progress of the survey. The local Arabic names of each site are collected; and even such faint indications of former buildings as are afforded by the discoloration of the soil are recorded. The result of the expedition will thus be the collection of materials for an exhaustive monograph of the topography, onomastic history, and archaeology of Palestine. The natural products of the soil will be the subject of a special map. And the geology of the country, hitherto almost entirely unknown, will be fully described.

About half the Holy Land, west of Jordan, has up to this time been surveyed. The most interesting outcome of the work hitherto has been the evidence collected of volcanic action, and of the series of successive depressions by which the valley of the Jordan has attained its present anomalous level; since the time when, after the deposit of the chalk, its waters ran into the Red Sea by the Gulf of Akaba. Identification of the topography of the books of Joshua and Judges has also made most satisfactory progress. Lieutenant Conder has surveyed and identified the sites—of the memorial raised by the trans-Jordanic tribes on their return to their possessions, (which a mistranslation in the authorised version of the Bible calls by the name of Ed); of the successive precincts of the Tabernacle at Gilgal, Shiloh, and Gibeon, where relics of large works in earthwork and in masonry have been found; of the Raven's peak, or "rock of Oreb;" and of the Wolf's den, translated "wine press of Zeeb;" together with the tribal boundaries that fell within the district surveyed. The fact that these lines of demarcation, so distinctly given in the Hebrew Book of Joshua, though often much obscured by incorrect translation, closely followed the ravines, watershed lines, and natural boundaries of the country, has not been hitherto brought out by any preceding geographer.

THE ethnological objects collected by Professor Bastian in his expedition to the Congo River have

been divided between the Royal Museum in Berlin, which thus receives 140 additions to its ethnographic cabinets, and the Anthropological Museum, to which all duplicates in the collection have been assigned.

By the foundering of the steamer *Liberia*, which sailed from Liverpool on April 15, the arms, ammunition, and provisions intended for the German expedition in Equatorial Africa have been lost, and for the present, therefore, it will be impossible for Dr. Güssfeld to carry out the wishes of the Company that he should establish depôts and intermediate stations along the whole line of his march from the coast into the interior. Fortunately, however, a previous consignment of arms and provisions had reached the African trading party on the Congo, and Dr. Güssfeld is therefore in hopes that he may soon be enabled to obtain supplies sufficient for the purpose of keeping open a line of communication between the coast and the most distant stations of the German traders. It has been officially announced at Berlin that the German Emperor has contributed a sum of 25,000 thalers to the funds of the Equatorial African Expedition, which owes its existence to the energetic and combined efforts of the various geographical societies of Germany. The results of the German expedition to the Loango coasts have been considered in a publication by Professor A. Bastian, in which he takes occasion to describe, from his own personal experience of the lands to be explored by the expedition, the ethnological character of the different local tribes, and the traces of civilisation which may be found amongst them. And although the learned author wishes his work to be regarded merely as subsidiary to the report of their proceedings which the directors of the expedition propose to publish, its own intrinsic value will not fail to secure for it the attention which everything written by Dr. Bastian on ethnographical subjects invariably obtains.

THE African traveller, Karl Mauch, has started from Caracas on his return journey to Germany. It will be remembered that it was his intention, in company with a botanist—Otto Kuntze, of Leipzig—to take a journey round the world. A variety of unfavourable circumstances has induced him to relinquish his purpose.

THE Berlin Academy of Sciences has granted a subsidy of 2,000 thalers to the African traveller Hildebrand, to aid him in his explorations in Central Africa. This is the largest sum which the Academy has ever voted for such a purpose. According to last advices, Hildebrand was still detained at Zanzibar for want of supplies.

It may be remembered that when Magellan discovered the Philippines he was astonished to light upon an Arabic alphabet in use at Cebu. On enquiry he found that somewhere about the ninth century some Muhammadan priests from Oman had landed here and taught the natives the Koran. Only some few isolated facts are known concerning the population of the islands of Oceania before their discovery by European voyagers, and any addition to our knowledge, however small, is therefore of great value. A Manila paper announces the discovery of some prehistoric remains, on the little islands of Rota and Tinian, which form part of the Ladrone or Mariana Islands. We have as yet but very scanty particulars of these antiquities; but they appear to consist in each case of two series of eight stone pyramids, standing in two rows, at intervals of 12 feet, the base being 12 feet square, and the height 36 feet. The summit is crowned by a kind of large cup equal in diameter to the diagonal of the base. Unfortunately the description of these pyramids given us leaves much to be desired, but there is little doubt that they belong to an age anterior to the Spanish conquest, and that they cannot possibly be ascribed to a race at all similar to the vindictive and degraded aborigines of the archipelago.

They would seem to have much in common with the prehistoric remains found in Mexico and some of the United States.

AN article in the *Levant Herald* gives a glowing account of the mineral wealth of Boz-Dagh, which forms the southern watershed of the river Ghediz, in the province of Smyrna. At Alashehr, the ancient Philadelphia, are three mineral springs, all of different qualities, with vestiges of ancient baths, and their waters are said to be very efficacious. Within a few miles of Alashehr are hot sulphur springs, lodes of native sulphur of considerable extent and thickness, veins of silver-lead ore, huge masses of chromate and carbonate of iron, coal, emery, etc. Alashehr is now connected with the port of Smyrna by railway, and rich returns would certainly follow the outlay of capital. But capital cannot at present be found for the purpose: for the natives understand the employment of capital only either in the acquisition of real property, or in some form of usury; while a decision of the Council of State that concessions for public works, etc., shall only be issued on condition that companies working them shall have their headquarters in Constantinople, prevents foreigners from investing their capital in the enterprise. So it seems likely that the great mineral resources of Boz-Dagh will remain for the present unexplored.

TRADE between Europe and the Argentine Republic has largely developed of late years, and there also exists a considerable emigration thither. About 2,100 vessels, with an aggregate of 800,000 tons, visit its ports in the course of the year, the number of those which clear averaging about the same. Buenos Ayres itself receives 360 steamers of an aggregate burthen of 250,000 tons, a fourth of these hailing from France. From a detailed statement of the imports and exports of the republic, we observe that these average 185 and 110 million francs (7,400,000*l.* and 4,400,000*l.*) respectively. France exports about a third of the total, and receives a little more than a fourth, while England sends rather less than France does, but receives in return more.

COLONEL STOLETOF, the chief of the Amu Daria expedition, has telegraphed to St. Petersburg to say that the *Perovsky* steamer has ascended the Oxus as far as the Nukus, and that the river is now perfectly navigable up to that point. The political and commercial importance of this discovery is very great, and Russian journals are of course jubilant. General Kaufmann had succeeded in removing the dams and other obstructions at the mouth, but this step was not attended with any great success; the *Invalide Russe* thinks that the present state of affairs may be attributed to the fact of the waters having been swollen to a very great degree from the melting of the snow and heavy rains in its upper course.

A LETTER from Irkutsk to the Russian *Gazette de l'Académie* states that an expedition has lately reached that town on its way to the heart of China. It is composed of MM. Sosnovsky, Mitoussovsky, who has already travelled to Kobi and Ouliasoutai by the Upper Irtysh, a naturalist, physician, &c. The object of the expedition is to visit the tea-plantations and to study the progress of the Doungan insurrection. It is proposed to start from Peking, traverse the whole of Central China to the north-west gate of the Great Wall, and then to make for the Irtysh by Ouliasoutai and Kobi. The expedition will also study the means of bringing to the Irtysh the tea caravans sent from the western plantations.

A CORRESPONDENT of the *Levant Herald*, writing from Adana, gives some details of a very painful character, which show that the effects of the famine in Asia Minor are not confined to the districts which are the immediate scene of its ravages. The influx of immigrants from the interior to Tarsus has been so great, that dead bodies are seen floating down the Cydnus, and

lying unburied on the very outskirts of the town; while only one-fifth of the ordinary inhabitants, half of whom are themselves ill, have remained in Tarsus in the presence of so much misery. Yet the immigrants prefer death by sickness to a lingering agony by starvation; and the local authorities have found it necessary to send a force to guard the gorge of Kulek Boghaz, in the Taurus, and prevent any more immigrants from finding their way into the plain.

THE AUSTRO-HUNGARIAN POLAR EXPEDITION.

ARCTIC exploration has made another great leap, and a fresh tract of the mighty but lessening "Unknown Region" is now brought within the sphere of our knowledge. The explorers are the crew of the *Tegethoff*, an Austrian steamer, and their achievement—an appropriate complement to the recent remarkable labours of Hall's expedition in the Western Hemisphere—consists in the discovery of an extensive land in a direction little thought of, to the north of the Russian islands of Novaya Zemlya. The *Tegethoff*, under the command of Captain Payer, a military officer, who, with Lieutenant Weyprecht, his present companion, had acquired some experience in Arctic navigation in a cruise to the east of Spitzbergen, left Bremen on June 13, 1872, on its northward journey. They had no thought of discovering the North Pole, or even of reaching an exceptionally high latitude, but their hope was to explore the lonely shores of Northern Siberia, under the idea that the mighty rivers which there discharge themselves into the frozen ocean must, by their higher temperature, facilitate navigation inshore. The vessel was carefully equipped with necessities for Arctic travel, not forgetting some trusty young Newfoundland and Esquimaux dogs for sledging purposes; while, in order to provide fully for the food department, Count Wilczec undertook to convey a supply of provisions and stores in his yacht, and deposit them at some convenient spot on the coast of Novaya Zemlya. This task the Count successfully accomplished, and during the few days that the two vessels remained in company a constant interchange of visits took place, and sledge parties made excursions to the neighbouring islands, returning laden with geological and botanical specimens and spoils of the chase.

The extraordinary variety of tongues spoken on board the *Tegethoff* appears to have occasioned the most amusing confusion. The crew spoke Slavonian among themselves and Italian when on duty; German was the colloquial medium in the cabin; the doctor spoke a mixture of Hungarian and Latin with the crew, but French when talking to the boatswain; two Tyrolese sailors conversed in a *patois* perfectly unintelligible to any one else on board; while the veteran ice-master Carlsen thundered his orders in Norwegian, with a sprinkling of Italian oaths. August 18 was the Emperor's birthday, and loyal hearts and appetites made due celebration thereof. Covers were laid for twelve: the *menu* comprised a haunch of reindeer, bear steaks, and a huge plum-pudding; and, after this substantial fare had been washed down by eighteen bottles of moselle, champagne, and Hungarian wine, the spirits of the lusty explorers gave vent to their loyalty in loud *Hochs!* which rang out on the frozen solitudes.

On August 21, 1872, Count Wilczec parted company from the *Tegethoff*, and after two or three narrow "squeaks" of being frozen in by the rapidly forming ice, managed to coast along the shore of Novaya Zemlya, and reach the estuary of the Petchora river in Northern Russia, from whence he made his way by boat to Perm, and so on to Moscow. Since then no tidings had reached us of the hardy explorers, but they were well provisioned for three years, and no anxiety on their behalf was felt till last spring, when the absence of any news gave rise to a variety of surmises. Their object, it must be remembered, was to coast

along the northern shore of Siberia, and emerge by the narrow outlet of Behring's Straits. Some were of opinion that they were wintering in the Liakhov group or New Siberian Archipelago, others pointed to the frozen marshes or *tundras*, as they are technically termed, which fringe the lonely estuaries of the Obi and Yenesei rivers, as a likelier spot; while others, again, hazarded an opinion that the good ship and her crew had never been able to extricate themselves from the imprisoning pack ice in which Count Wilczec had left them. It was answered, not without reason, that the Yakuts or "Iron Men" of Siberia, as Atkinson has dubbed them, in their brief summer excursions northward in quest of fish or mammoth ivory, would have come across some trace of the missing vessel had her course lain towards Northern Asia, while Captain Isaksen, a Norwegian fisherman of Arctic experience, proved conclusively, by circumnavigating its northern extremity without finding any trace of the party, that they had quitted Novaya Zemlya.

It now appears their steps had been elsewhere directed. For fourteen long months after Count Wilczec's departure, they were driven about helplessly in the imprisoning ice, first to the north-east as far as 73° E. longitude, and then to the north-west. Here, when in latitude 79° 51' N. and longitude 59° E., they discovered, in August, 1873, an extensive land, which they named Francis Joseph Land, stretching away to the north and west beyond 82° N. latitude, and as far as the eye could reach. On landing, it proved to be composed of dolomite mountains, seamed by huge glaciers and boasting but little vegetation and animal life. A second winter was passed on the pack, but this appears to have strained the vessel so severely that in May last she became totally unseaworthy, and had to be abandoned. On the 20th the explorers took to four sledges, and after no less than ninety-six days' weary travelling over the ice, arrived in Clear Bay, Novaya Zemlya, where they were picked up by a Russian vessel and brought to Vardoe, in Norway, in good health, one man alone having succumbed to lung disease.

It is, perhaps, not premature to hazard the conclusion that in this new land we have the eastern continuation of the abrupt and mountainous coast of East Greenland, which, as geographers of Petermann's school are of opinion, trends away to the north-east, slightly beyond Parry's furthest point north of Spitzbergen. The scarcity of animal life at first sight appears important. Around the shores of Smith Sound Hayes tells us the whole region teems with animal life, and one good hunter would feed twenty mouths; the sea abounds in walrus, seal, narwhal and white whale; the land in reindeer, foxes, eider duck, wild geese, snipe, and gulls of various description, and the ice is the roaming-ground of bears. Again, to the north in "Thank God" Bay, Hall's party found the plain free from snow, a creeping herbage covering the ground, on which numerous herds of musk oxen found pasture, while rabbits and lemmings abounded. The wild flowers were brilliant, and large flocks of birds came northward. Francis Joseph Land would, on the other hand, appear to be less favoured as regards climate. This may be attributed to the presence of colder currents than are met with in Smith's Sound. But it is not too much to assume that animal life may have existed there, though not seen by them. Admiral Osborn, that staunch advocate of Arctic research, points out that in the Parry group there is scarcely a single island where properly organised hunting parties could not have largely added to the resources of the English who wintered there. No limit has as yet been discovered to the existence of animal life within the Arctic circle, and it is most improbable that the failure to discover it immediately in this new region has more than a passing significance. The healthy condition of the crew is indeed no surprising circum-

stance. Our readers will perhaps recollect the astonishment of the good folks of Dundee at the hale appearance of the American survivors of Hall's expedition, who, after great privations, were happily rescued and landed there last year from the *Arctic* and *Raven* whalers. Arctic officers have also been at pains to collect statistics which tend to prove that with proper precautions there is no healthier station in the world than the Arctic regions for our ships. The corroborative proof afforded by the healthiness of the Austro-Hungarian party is a fresh argument on the side of the supporters of an English Government expedition. We cannot but express an earnest hope that Mr. Disraeli, whose views on such subjects are, if we argue rightly from his speeches and writings, large-minded and unprejudiced, will see cause to speed an English vessel to that field of enterprise where Germany, America, Sweden, and Austria have lately so nobly striven. The prizes are many and within our grasp; experienced volunteers are eager to be led on; it remains but to appeal to the nation, and her sons will gladly reply, "It is to be done, and England ought to do it."

SIR JOSEPH WILLIAMSON.

THE facts brought to light about Sir Joseph Williamson by the late Mr. Christie in his edition, for the Camden Society, of letters addressed to him in 1673 and 1674, together with the additions made by Mr. R. C. Browne in his notice of the work in these columns some few weeks since, may be supplemented by a few other matters of interest noted in going through the State Papers of the reign of Charles II., which have not yet been calendared or printed. First with regard to the disparaging reference to Williamson in Evelyn's Diary under the date of July 22, 1674, it is important to record that many letters are preserved of a little earlier date which show Evelyn by no means reluctant to avail himself of the "subtlety, dexterity and insinuation" of Arlington's "man Williamson." One specimen of them will suffice, not the least remarkable portion of which is the postscript.

"I heare (I know not how true it is) that Mr Odart is irrecoverably sick: I do assure you. I do not wish him dead: but, if it should please God to take him from the living, speak favourably in my behalf, that I may succeed in the character wh he must leave. You know it is not a station to be envied for the emolument of it; but I would not refuse an opportunity which might render me any degree nearer to his Ma^{ty} service. I make use of your sole friendship herein, because I will owe nothing to any body only to my L^d Arlington & you, who am &c.

"J. EVELYN.

"Sr. If this succede not be kind to me & burne this paper."

The station sought after by the writer is disclosed to us by Williamson's endorsement, which runs:—"Mr. Evelyn—Sec: of Latin Tongue."

Another diligent seeker after preferment at Sir Joseph's hands is none other than Lancelot Addison, best known to us now as the father of Joseph, though not without claims himself to literary distinction. Lancelot was of the same college at Oxford as Williamson, and very probably contemporary with him there. It will be worth while to give a few extracts from this correspondence, unpleasant though the self-portraiture is of a somewhat grasping, sycophantic divine.

"I could wish it were decent to acquaint you with the fatigue which for many years I underwent abroad, animated thereunto with fair Promises from Home. But of this I may have permission to be larger, when I have (wh^{ch} I hope will be shortly) the happiness to kiss your Hand. I protest, Sr in all sincerity that I esteem my condition prosperous in your Patronage. And,

through the divine assistance, I will employ my utmost powers that you may not be discouraged to own me for
"S"

"Yo^r most bounden & most
grateful servant

"LANCLOTT ADDISON.

"Melston near Sarum
"Aug. 29 1671."

"July 12 1677.

"May it please yo^r Hon^r

"I am just now advised that by the death of one Mr Sly, who lies now in extremis, there will be a prebend vacant in the church of Sarum, as likewise a parsonage called Levels Upton: they both ly near me, & the obtaining of either of them would be a more then ordinary encouragement. The Parsonage is in my L^d Chancellors gift, by vertue of y^e Broad Seal, the prebend in the Bishops. Finding your Honor fully inclined to do me a kindness I could not but solicit your interest for me in this particular. . . . I dare not, S^r, intimate a method: but a line to the Bishop from the King would do the worke, and I doubt not but upon this timely advice, your power with my Lord Chancellor will be prevalent. . . .

"Yo^r most obliged servant,

"LANCLOTT ADDISON."

The above is addressed to Sir Joseph Williamson "at Stanhop house by Charing Crosse," and is endorsed "L^d Addison."

In a second letter, written just a week later, he again acquaints Williamson with the possibility of these two vacancies occurring, and adds:—

"I hardly intimate this, as hoping there will need no more to move you to use yo^r interest in procuring either of them for me. They both ly very convenient for my present situation and would make me such a comfortable subsistence as throw God would inable me to provide for my family."

Writing again on Aug. 13, he says:—

"The prebend I last mention'd to your Honor is still in being, but so weak, that 'tis thought impossible he should endure above a month. If your Honor would please to signify to the Bishop your desires in my behalf . . . 'tis possible yo^r Honors importunity may worke him to a promise of the next.

"The Minister of the next parish to me begins to decay much in his health, his Liveing is in the gift of the Lord Chancellor; the name of the place is North Tedworth, value 11—16—11, in Amesbury Deanery. I have no doubt at all that any has yet been interceding for it. Our parishes joyne one to the other, and its annuall value is about 100*l*. per ann.

"I mention this to yo^r Honor, in hopes you will make such advantage of it in due time, as may greatten (if possible) my present obligation in all respects to manifest my selfe

"Yo^r Honors

"most humble servant

"LANC: ADDISON."

Nothing is found in these papers to show that Addison was successful in his applications; but that his persistence was ultimately rewarded is made clear by the well-known fact of his appointment about six years afterwards to the deanery of Lichfield.

The adulatory effusions in prose and verse, Latin and English, addressed to Williamson, were very numerous, and have been carefully preserved to posterity by the recipient. As a pattern of dog-grel verse the following would be difficult to surpass:—

"To the Right Honorable S^r Joseph Williamson,
Principal Secretary of State.

"Wonder of men & Joy of Scholars; who
Adorne & serve the court and kingdom too;
Who have through all degrees of hon^r gone
And are yet vigorously moving on,
Be pleas'd, whilst to Olympus topp you goe
Still to look down on mee & cloudes below;
Me whom crosse fate hath a right Poet made,
Who am undone wthout yo^r p'sent aide;
That what you give will bee a treble boon,
If (noble S^r) you'll give it *εὖ τῶν δῶν*."

"A. BRETT."

The writer of this was no doubt Arthur Brett, who was educated at Westminster School and Christ Church, and published a poem on the

Restoration. He was afterwards vicar of Market Lavington in Wiltshire, and is said to have died in London about 1677 in great want.

A far more touching eulogium of Williamson is that contained in a letter to him from the antiquary, John Aubrey, dated March 15, 1675, which concludes

"In the mean time I shall, and ever shall continue to offer up my prayers for your length of dayes, and continuation of yo^r Honours happines, being so good a Man, and so great a Zelot for the Advancement of learning. God lead yo^r Honour by the hand

"Your Hon^r" most obliged

"most affectionate & most

"humble servant

"JO: AUBREY."

The close connexion of Sir Joseph Williamson with the men and events of his day is so totally disregarded by historians and biographers that one may perhaps be pardoned for dwelling at such a length on any new materials which serve to illustrate it.

CORRESPONDENCE.

"SPURIOUS HEBREW COINS."

Palestine Exploration Fund, 9 Pall Mall East:
Sept. 9, 1874.

The article with this title in last week's ACADEMY seems to refer to the shekels recently sent home from Jerusalem by the late Mr. C. F. Tyrwhitt Drake. At least, I have heard of no other Hebrew coins arriving lately in England. Mr. Drake is, unfortunately, no longer able to write in defence of his coins; I therefore send you the very few facts in my possession with regard to their acquisition. The first news of the coins came from M. Clermont Ganneau, writing on January 22 of

this year, who told me that he had acquired a certain number of "silver shekels." A week later I had a short letter (January 29, 1874) from Mr. Drake, in which he merely says that he has "bought a lot which are undoubtedly genuine." I believe that a few were also bought singly by residents in Jerusalem and travellers. When Lieutenant Conder came home in May, he put into my hands a packet entrusted to him by Mr. Drake for me. It contained these shekels, which he wished me to consign to safe custody until he could arrange for them. The packet was opened by me in the presence of Mr. Greville Chester. I then took them to the British Museum. There were twenty-four shekels in all, dated 1, 2, 3, 4, of which five bore the date 4. Mr. Poole very kindly took charge of them, and they have been in his care ever since, the lamentable death of Mr. Drake having prevented any further proceedings in the matter. Probably we shall be able to obtain from M. Clermont Ganneau further particulars as to the "find," which, unless the question of genuineness is by that time decided by competent numismatists, I will forward to the ACADEMY.

WALTER BESANT.

Nash Mills, Hemel Hempstead: Sept. 8, 1874.

In the ACADEMY of the 5th instant is an article headed "Spurious Hebrew Coins," which ought not to be allowed to pass without comment, as it is calculated to injure or destroy the value of a number of coins of which the author of the article is certainly not the proprietor. Under such circumstances, the utmost caution ought to have been exercised, but the judgment, pronounced as it were *ex cathedra*, appears on the face of it to proceed from one whose acquaintance with Jewish coins, and indeed with ancient coins in general, is but imperfect, or at best theoretical rather than practical.

For instance, the coins in question, which form part of a recent "find" in Palestine—and which, according to the ACADEMY, cannot have formed a portion of a genuine coinage—are described as three-quarter shekels belonging to the period of the Roman domination; whereas by all numismatic writers these pieces are regarded as shekels—as, indeed, the legend upon them, "Shekel Israel," sufficiently indicates—and are assigned to the time of the Maccabees, if not to a still earlier period. To any one versed in numismatics, the application of the term *patina* to the colouring or oxidation of a silver coin will sound not a little strange. The mention of "careful" file-marks on the edges of the "accepted specimens of this curious kind of coin," and the suggestion that these pieces may have been cast on old matrices will also strike any coin collector as novel in their way.

These circumstances are however only of importance as being factors in that personal equation by which the value of an opinion is to be judged; for in questions of authenticity, absolute proof is difficult. The value of the evidence as to specific gravity, on which so much stress is laid, depends also upon the accuracy of the observer, and the determination of 10.8 has yet to be verified.

The specific gravity of pure silver is given in Miller's Chemistry as 10.53, and if this be for the cast metal, its specific gravity when compressed by coining would be somewhat greater. The lower gravity of the English and French silver coinages is accounted for by their being alloyed with the lighter metal, copper.

Though the author of the article stigmatises the coins as cast, and therefore forged, he mentions one circumstance which in itself affords the strongest presumption of their being genuine. If they were cast, it is probable that the moulds made use of would have been few in number; but it appears that there are two varieties, or, as the article terms them, "types," of the first year, five of the second, two of the third, and four of the fourth—or thirteen varieties in all. What, however, is the history of the find?

The fact is that these coins form part of a hoard of a hundred shekels lately found near Jericho, some of which, including those in question, were secured by the late Mr. Tyrwhitt Drake, and the remainder by M. Ganneau. They had been deposited in an earthen pot the cover of which had in some manner been secured with lead, and with them was found a gold seal with a gem on which wheatears are engraved—the whole circumstances being such as to afford no ground for suspicion. The author of the article, indeed, suggests that the forgery may have taken place seventeen centuries ago, but we can hardly assume that a forger, after being at the pains to make at least thirteen varieties of shekels, would complete the transaction by burying them *en masse*. I will only add that I saw the coins about two months ago, and that they appeared to me to have been struck and not cast, and to be perfectly genuine. I am, indeed, in hopes of being allowed to purchase some of them for my collection. I may further mention that the coins are at the present time in the Medal Room at the British Museum, where they can probably be seen by any experienced numismatist who is interested in the Jewish coinage.

JOHN EVANS,
President of the Numismatic Society
of London.

"WHO WROTE OUR OLD PLAYS?"

Trinity College, Dublin: September 7, 1874.

Mr. Fleay, in his article "Who Wrote our Old Plays?" in the current number of *Macmillan's Magazine*, makes known the result of his application of "quantitative criticism" to the play of *Cymbeline*. The play, he states, was begun about 1605, and finished between 1607 and 1608. Mr. Fleay is, perhaps, not aware that he has been anticipated in the application of verse-tests to the determining the dates of Shakspeare's plays by Professor W. A. B. Hertzberg. With respect to *Cymbeline*, Professor Hertzberg arrives at a different conclusion from Mr. Fleay. The tests employed are the rhyme-test, feminine ending, weak ending, alexandrine, and verse irregularly constructed (including verses in which an anapest is used instead of an iambus). Professor Hertzberg is of opinion that the rhyme-test is to be used with caution, and cannot be absolutely relied on. He believes that in the case of *Cymbeline* the frequency of weak-endings (of which seventy-two are enumerated) decisively proves a later date. But the test in which he has the fullest confidence for determining the date of Shakspeare's plays, is the feminine ending. He gives a table of the percentage of feminine endings in nineteen plays, of which the last four are *Winter's Tale*, *Cymbeline*, *The Tempest* (between which the difference of percentage is less than one), and then (with a sudden leap to forty-four, to be accounted for by Fletcher's co-operation) *Henry VIII.* The date of *Cymbeline*, according to Professor Hertzberg, is 1611. Thus the results of aesthetic criticism are in a remarkable manner confirmed by Professor Hertzberg's quantitative criticism.

I may add that Professor Hertzberg (in 1871) placed *The Two Gentlemen of Verona* sixth upon his list, side by side with *The Merchant of Venice*. Mr. Fleay, working independently, arrives at the same result.

See the prefaces of Hertzberg in the volumes of Schlegel's and Tieck's translation of Shakspeare's dramatic works, published during a series of years (ending in 1871) under the redaction of Ulrich, "herausgegeben durch die Deutsche Shakspeare-Gesellschaft." (Berlin: Georg Reimer.)

EDWARD DOWDEN.

POSTHUMUS IN "CYMBELINE."—A CORRECTOR CORRECTED.

Skipton Grammar School: September 7, 1874.

In the *ACADEMY* of September 5 is a correction of a statement of mine made in *Macmillan's Magazine*, for which I am very thankful to the courteous

corrector. It would undoubtedly have expressed my meaning more closely had I written, "In this scene only is the pronunciation *Posthumus* adopted," instead of "in this scene *Posthumus* is the pronunciation adopted." But when the scansion—

"The residence | of Post|humus: | so nigh | at least"
is adduced as an argument against me, I demur. I open my Shakspeare at random, and find these lines:—

"To buy | you a bet|ter hus|band. O my | dear
Lord." *Measure for Measure*, V. i. 430.

"Famili|ar as | his gar|ter. But what | he spent,"
Henry V., I. i. 46.

corresponding syllable for syllable to

"The residence of | Post|humus. So nigh | at least."
I then look through the play of *Measure for Measure* and find the following instances of similar scansion:—i. 1. 56; i. 3. 3; i. 3. 45; i. 4. 52; i. 4. 68; ii. 1. 31; ii. 2. 28; ii. 2. 41; ii. 2. 85; ii. 2. 104; ii. 2. 160; ii. 3. 42; ii. 4. 42; ii. 4. 163; iii. 1. 38; iii. 1. 41; iii. 1. 103; iii. 2. 28; iv. 1. 48; iv. 2. 68; iv. 3. 115; iv. 3. 132; iv. 4. 23; iv. 4. 31; v. 1. 8; v. 1. 34; v. 1. 51; v. 1. 64; v. 1. 68; v. 1. 73; v. 1. 158; v. 1. 162; v. 1. 300; v. 1. 526—in every one of which there is an extra syllable after the third measure before a pause. If my corrector will kindly support his scansion by as many six-measure lines with the same cesura as the line as he scans it from the whole of *Shakspeare's works*, I will admit it as preferable to my own.

With regard to the other line, I fully admit that it may be read *Posthúmus*; but I much prefer

"A headless man! T' garments o' *Pósthumus*,"
with the article pronounced as now in Yorkshire; and as very often in Shakspeare. It is ungracious to use the *argumentum ad hominem*: but surely Mr. Furnivall has forgotten that he has twice urged on me the reading

"Neglecting worldly ends, all dedicated" (*sic*)
in *The Tempest*, i. 2. 88, or he would not be so severe on squeezing out the *i* of "residence," which, by the bye, I do not do; my reasons for not counting the syllables on my fingers being substantially the same as those of Mr. Ellis in *Early English Pronunciation*, part iii., p. 928, &c. I may add that this pronunciation of *Posthumus* is only one of the arguments adduced by me for the earlier date of this scene: I have also shown (1) that it has a much greater proportion of rhymes than any other scene in the play; (2) that the song does not agree with the dialogue, and is probably an after insertion; (3) that this scene is derived from a different source from the others; and there are other reasons too long to give here.

If it would not be too great a trouble for Mr. Furnivall to let me know why he speaks of my "incautious" statements in marks of quotation, I will acknowledge a new obligation to him in addition to giving him my cordial thanks for the high praise he has bestowed on so many of my investigations in your paper and elsewhere.

F. G. FLEAY.

THE ETYMOLOGY OF "ANENT."

Cambridge: Sept. 6, 1874.

The guesswork system, unfortunately too prevalent in English philology, is well illustrated by the word *anent*, concerning the etymology of which most dictionaries are all astray. Dr. Strattmann, by the way, has the correct one. So also has Koch. Dr. Morris gives it wrongly on p. 128, but rightly on p. 206 of his book. Jamieson gives us the choice of the Greek *ἔναντι* or of the A.S. *oncean*; on which it may be remarked that this is guesswork run wild, for how came the Greek word into Early English? And why should the A.S. *oncean*, after producing the word *again*, produce so different a word as *anent*? Moreover, the sense of *anent* is *respecting*, not *against*. Mahn's Webster gives the alternative of A.S. *oncean*,

or Gk. *ἐναντι* (as if it made no particular difference!), or else that it is from the (unexplained) prefix *a* and the A.S. *nean*, near, nigh! Mr. Wedgwood says:—

"*Anent*, *Anentst*, in face of, respecting. A.S. *oncean*, opposite; *foran oncean*, *foran gen* (Thorpe's Dipl., p. 341), over against, opposite, in front, Sc. *for anent*. The word *anent*, however, does not seem to come directly from the A.S. *oncean*. It shows at least a northern influence, from the O.N. *gíegut*, Sw. *gent*, opposite, *gent öfwer*, over against. Hence *on gent*, *anent*, &c."

Now this *foran gen* can only explain *fore-anent* at the most; it throws no light at all on the more common use of *anent*, in the sense of *respecting*. No quotation is offered for the particular form *on gent*, which has the air of being an imaginary link, invented for the sake of strengthening the argument at its weakest point.

Meanwhile, there is a very different word which will explain how *anent* comes to mean *respecting*. The true root of the word is A.S. *efen*, Eng. *even*, cognate with German *eben*. Hence was formed a common compound word, *on-efen*, used as a preposition with the dative case; see examples in Grein, s. v. *efen*. But the word *efen* was commonly corrupted into *enn*; see *enn* in Grein. At the same time *on-efen* was made into *on-enn*, as in Byrhtnoth, l. 184—"on-enn hyra frēan," beside their lord. Next we find *an-enn* in the sense of *equally*, in Shoreham's poems, ed. Wright, p. 75; *an-en* in Mandeville's Travels, ed. Halliwell, p. 80; the full form *anefent* (with an additional inorganic *t*, such as is seen in *amongst*, *against*) in the Ancrun Riwle, and the shorter *anente* in Alexander, ed. Stevenson, l. 735, where as *anente me* is equivalent to *as concerning me*. Thus the successive forms are *on efen*, *on efn*, *on enn*, *anen*; or, with an added *t*, *anefent*, *anent*. Nor did the word stop here; for the common adverbial (northern English) suffix *-is* was appended, giving *anentis*, afterwards corrupted into *anents*, *anence*, and *anest*, all of which forms are found. The successive senses are *on even* or *on an equality*, *equally*, *close beside*, *in close relation to*, *concerning*, &c.

It is interesting to trace the fate of the corresponding words in German. There we find the Old High German *epan*, now spelt *eben*. Hence, with the prefix *in* instead of *on* (which does not affect the meaning), we get *in eben*, *enneben*, *eneben*, and finally *neben*, now a common preposition, often with the sense of *beside*, though literally *on an equality with*. Hence *anent* and G. *neben* are, practically, the same word.

The word *anent* once established, it is easy to see how the A.S. *foran oncean* (used in Matt. xxi. 2), which, etymologically, would change into *fore-again* or *fore-against*, was wrongly turned into *fore-anent*. A little reflection will show that this supposition alone is quite sufficient to account for the term *fore-anent* (not found, I believe, at any very early date), without calling in the aid of the A.S. *oncean* at all. The forms *anence*, *anentst*, are merely due to the influence of the parallel forms *against*, *againstst*; not in any sense thence derived. The mention of the Swedish *gent* is quite superfluous, as in reality furnishing no more than an illustration; and the comparison with the Greek *ἐναντι* is merely ridiculous, because we know that word to be equivalent to the English in together with the Old English *and*, a prefix still preserved in *answer* (for *and-swear*, to affirm in return). The suggestion in Mahn's Webster as to a *nean* is peculiarly bad, because there is no trace of the use of it; and only exemplifies the common error of saying "never mind the evidence, let's guess;" a proceeding quite unworthy of the present state of philology, as it may be pursued, with the help of new and good books. As regards the etymological department, it must be confessed that even our best dictionaries are susceptible of great improvement. Every scholar should do his best to abolish guesswork.

WALTER W. SKEAT.

SCIENCE.

Descriptive Sociology; or, Groups of Sociological Facts. Classified and arranged by Herbert Spencer. No. 2.—*Ancient Mexicans, Central Americans, Chibchas, and Ancient Peruvians.* Compiled and abstracted by Richard Scheppig, Ph.D. No. 3.—*Types of Lowest Races, Negritto Races, and Malayo-Polynesian Races.* Compiled and abstracted by Prof. David Duncan. (London: Williams & Norgate, 1874.)

DR. SCHEPPIG'S compilation of evidence as to the four extinct civilisations of America is of excellent quality. The literature whence it is extracted is mostly Spanish, including various books little known to modern readers. The interesting nation of the Chibchas or Muisca of New Granada, with their organised army and priesthood, their temples and palaces, have had less notice than they deserved, though Humboldt, in the *Vues des Cordillères*, called attention to their curious astronomical calendar. This want in American history is remedied by Waitz—*Anthropologie* (part iv.)—and still more fully in the present work, where copious extracts are given from Piedrahita, Fray Pedro Simon, and other early authorities. As to Mexico, Dr. Scheppig has used, among other books, that of Orozco y Berra, *Geografía de las Lenguas y Carta Etnográfica de México* (1864). As this was only published ten years ago in Mexico, it has hardly yet become known in Europe; it appears from the extracts to be unusually sober and reasonable. It is satisfactory to find Dr. Scheppig bringing reasonable scepticism to bear on those traditions of the Toltecs which have so long mystified genuine Mexican history. He leaves the patriotic Ixtlilxochitl to tell the Toltec legend, and his later interpreters to explain it away as a myth of the origin of castes, or of "telluric powers, the agents of the subterranean fire." Dr. Scheppig himself is content to investigate the Mexican civilisation as the Spaniards found it in actual existence.

It is strange, however, that among the accounts cited by him of the Mexican system of reckoning time by cycles of days, months, and years, nothing should be said of the remarkable similarity to Asiatic systems, pointed out by Humboldt. The line which Dr. Scheppig takes as to the age of the ruined palaces and temples of Central America deserves remark. Stephens thought these wonderful structures modern, built by the nations whom the Spaniards found living near them. Dr. Scheppig supports the contrary view, that they were then already ancient ruins, almost forgotten by the Indians. The following passage from a letter to Philip II. by Fray L. de Bienvenida, who came to Yucatan as early as 1534, is certainly strong evidence on this side:—

"In all the Indies there have not been found such fine buildings [as at Merida]. It is impossible to say who has erected them. It seems that it has been done before the birth of Jesus Christ, for there were trees on them as large as those beside them. These buildings are five stories in height, and are built of dry stones. On the top are four apartments, divided into small cells like those of monks. . . . There are many similar buildings in the country. The natives do not

inhabit them; their houses are constructed of straw and wood, though they have stones and lime."

We learn with regret that Dr. Scheppig's health has suffered from overwork, and that his next instalment, on Extinct Civilisations of the East, will be delayed. It is to be hoped that he may soon be able to complete it, as, judging from the present, it will be a work of importance.

Mr. Spencer, in his preface to Professor Duncan's collection of information as to the Lowest Races, &c., acknowledges its deficiencies, and explains them as due to its being the first instalment compiled, before the method was sufficiently matured. This is the more to be regretted, from the great anthropological interest attaching to such races as Australians, Papuans, and Polynesians. The authorities used are almost all English, and comprise only a fraction of those enumerated by Waitz and Gerland. For information as to the Tonga Islanders, passages are given one after another, some as extracts from "Martin's Tonga," and others from "Mariner's Tonga Islands," the compiler not seeming aware that he is quoting a single well-known book under two titles, it having been composed by Dr. Martin from the materials supplied by Mariner, who had lived on the islands. Another blemish is the word *Negrittos*, put even on the title-page, to denote the New Caledonians, &c., instead of the proper Spanish form *Negritos*, i.e., "little negros."

Notwithstanding defects, however, the tabulated information brought together by Professor Duncan will be of much use to ethnologists. E. B. TYLOR.

ARABIC NUMISMATICS.

Beiträge zur Muhammedanischen Münzkunde. Von Dr. E. von Bergmann, Custos am k.k. Münz- und Antiken-Cabinete, Wien. (Aus den Sitzungsberichten der phil.-hist. Classe der kais. Akademie der Wissenschaften besonders abgedruckt. Wien: Karl Gerold's Sohn.)

THE essay now before us furnishes a remarkable instance of the value of coins to the historian. It is singular how little attention historians pay to the store of materials afforded them by these monuments. It is true that in European history coins for the most part play a comparatively insignificant rôle; but in the East, in Mohammedan history, they are by far the trustiest guides. No Muslim king or petty prince thought his dignity complete till he had struck coins; and he did not merely strike them at his capital, but in every large town throughout his kingdom or province. Hence we have (or rather we should have, if our collections were quite complete) authoritative evidence for the date of every king's accession and for the extent of his dominions. Besides this, we generally find on the coins the names of the king's father, grandfather, and even great-grandfather, and often of his heir-designate, not to mention those of his political liege-lord, and of his religious head the Khalifeh. And it must be remembered that these historical details, or some of them, are afforded with reference to more than one hundred and twenty Mohammedan dynasties.

Yet no historian of the East, native or European, seems to have taken the slightest trouble to get numismatic evidence for his facts.

Dr. von Bergmann has shown that coins not only contribute largely to our knowledge of the political history of the Muslims, but also to their religious history.

The first of the five coins described in this essay bears upon the sectarian disposition of the Muslim Berbers of North Africa. Dr. von Bergmann traces down the religious history of this part of the Mohammadan world with a slight, but masterly hand. The northern provinces of Africa adopted the creed of Islam with the same élan as the rest of the countries over which the Arabs sought to spread their empire. But the quickness of the adoption was no guarantee for the durability of the impression. The Berbers were not a people for a staunch adhesion to a theological system:—

"Noteworthy for this cause is the saying of the Arab general, Ukba Ibn Nafi, who above all others most clearly grasped the character of the Berbers, That whilst an Imām trode the ground of Africa they would hold fast to Islam, but when his back was turned every one of them would fall away again from the religion of God. Not (adds Dr. von Bergmann) that the Berbers in general were insusceptible of a religious enthusiasm; on the contrary, they have never stepped upon the stage of history except when set in motion by a Priest for a religious idea, as the appearance of the 'Almoravides' and 'Almohades' shows; but Islam, in the form maintained by the orthodox party, which came into power with the Amawi Khalifehs, a form but little recommended by the land-impovertying deputies, found only outward and little-enthusiastic followers. So much the greater applause fell to the share of the democratic doctrines preached by fugitive Khārijis. The doctrines of the Sifris and Ibādīs, with the perfect Equality of all co-religionists and the Sovereignty of the People, for which they contended, were far more national than inflexible Orthodoxy with its empty dogmatism. As the direct consequence of the spread of Khārijī principles there broke out a general revolt against the Amawi deputy, in which the lead was taken by the Berber Maisarah, who even declared himself Khalifeh. Only after a war of thirty years was the bloody suppression of the rebellion attained, and isolated upheavals continually succeeded at greater or less intervals."

The people of the district where Sijilmāseh was afterwards built were among the earliest African converts to Sifri doctrines, and lent their aid to the revolt of Maisarah. About the year of the flight 140, twoscore chieftains renounced their allegiance to the 'Abbāsi Khalifeh, and chose for their leader 'Isā EL-Aswad, who founded the town of Sijilmāseh. Some twenty years passed, and the people became weary of the rule of EL-Aswad, and exposed him, bound, upon a mountain-peak, till he was starved to death. The successor to "The Black's" power was Samkū Ibn Wāsil, in whose family, which is known as the Beni-Wāsil or the Beni-Midrār indifferently, the government of Sijilmāseh remained, with two short interruptions, for two centuries. It is not necessary to follow Dr. von Bergmann through the history of this little dynasty; enough to say that, although their opinions always (with the exception of one temporary apostasy) leaned to the tenets of the Khawārij, yet they kept on good terms with the 'Abbāsi Khalifehs, and opposed the Shiya'is. When the Fawātim be-

gan to promulgate their doctrines in Africa, Alisa II., of the Beni-Wasil, being warned by the 'Abbāsi Khalifeh of the true nature and object of the pretensions of the Fātīmi reformers, seized the persons of El-Mahdi and his son Abu-l-Kāsim, and held them in prison until the Fātīmi general, Abū-'Abd-Allāh released them by force.

It was by almost the last prince of the Beni-Wasil that the first coin described by Dr. von Bergmann was struck in 346 of the flight. This dinār bears (besides the usual Muslim formulae) the name and surname of Mohammad Ibn-el-Feth Esh-Shakir-li-llāh (A.H. 331-348), with the title El-Imām. On the adoption of this title Dr. von Bergmann lays great stress, for it was only a descendant of the tribe of Kureysh who could call himself Imām, according to the teaching of the Sunnis, to whose doctrines Ibn-El-Feth, alone of all his dynasty, had declared allegiance. But Ibn-el-Feth was a Berber, not a Kurashī, and therefore if he had remained true to his Sunni professions he would not have ventured to assume the title of Imām. In drawing this conclusion Dr. von Bergmann has overlooked the perfect possibility that Ibn-el-Feth might have been a Kurashī, as a very remote connexion would have constituted him one of the tribe of Kureysh. Moreover there would ordinarily have been nothing very remarkable in his being called El-Imām, for this title is commonly applied to the ministers of a mosque, to the leaders of sects, and even to men renowned only for their learning, without reference to religion. But we must agree with Dr. von Bergmann that the occurrence of this title on a coin is highly remarkable, and implies something very different from the ordinary meaning. It implies, in fact, nothing less than that Ibn-el-Feth was Imām in the same sense as the 'Abbāsi Khalifeh, a proposition utterly untenable by a Sunni. Whilst, therefore, we reject Dr. von Bergmann's premises, we entirely accept, on other grounds, his conclusion, that the apostate must have returned to his fathers' faith, and once more gave in his adhesion to the Khārījīs.

Dr. von Bergmann next enters into a detailed account of the short but powerful Kurd-dynasty of the Hasanweyhis, and publishes a dirhem struck by Bedr Ibn Hasanweyh († 405 A.H.) the second of the line. The remarks appended to the description of this coin are worthy of the careful study of the Oriental historian, as bearing upon the relations between the Arabs, Kurds, and Turkumāns, in the fourth and fifth centuries of the Hijreh; and the notes on the normal weight of the dirhem are of great numismatic interest.

The third coin published by Dr. von Bergmann is a dirhem, struck by the wezīr Abū-'Alī, the son of El-Afdāl, at Misr, in 525 A.H., bearing the name of Abu-l-Kāsim Mohammad El-Muntadhar-bi-amri-llāh, the twelfth Imām. This dirhem is identical with one published by F. Soret in a letter to Professor Tornberg in the *Revue Archéologique* (xiii^e année), with which the learned Viennese numismatist does not appear to have been acquainted. As the whole question of the remarkable occurrence of the twelfth Imām's name on an Egyptian coin

struck 200 years after his death has been discussed in a paper which was published in the last Part of the Journal of the Royal Asiatic Society, it will suffice to say here that Dr. von Bergmann, like S. de Sacy and H. Sauvage, has discovered the true solution of the difficulty.

The fourth and fifth coins are of Khidr, a grandson of Sārū Khān, and of Ibrāhīm Ibn Mohammad, the Karamanian. Both are interesting: the former especially, as the first coin of the Sārū-Khān dynasty with purely Arabic, instead of Latin, inscriptions hitherto made known.

STANLEY LANE POOLE.

SOME SCIENCE MANUALS.

A Manual of Inorganic Chemistry: The Non-Metals. By T. E. Thorpe, Ph.D., F.R.S.E., Professor of Chemistry in the Andersonian Institution, Glasgow. 8vo. Illustrated. 399 pages. 1874.

Inorganic Chemistry. By Dr. W. B. Kemshead, F.R.A.S. 8vo. Illustrated. 183 pages. 1873.

Elementary Treatise on Nautical Astronomy, for the Use of Science Classes and Seamen. By Henry Euer, LL.D. 8vo. Illustrated. 144 pages. 1873.

Outlines of Natural Philosophy. By Bentham Simpson. 8vo. Illustrated. 190 pages. 1873. (London and Glasgow: William Collins & Sons.)

The Laboratory Guide: A Manual of Practical Chemistry for Colleges and Schools, specially arranged for Agricultural Students. By Arthur Herbert Church, M.A., Professor of Chemistry in the Agricultural College, Cirencester. Third Edition, enlarged and revised. 8vo, 215 pages. (London: Van Voorst.)

Introduction to the Study of Organic Chemistry. By Henry E. Armstrong, Ph.D., F.C.S., Professor of Chemistry in the London Institution. Small 8vo. 342 pp. (London: Longmans, Green & Co., 1874.)

MESSRS. COLLINS have in course of publication an extensive series of works on Science. The first of the above books belongs to their "Advanced Science Series;" the second and third to an "Elementary Series," and the last to a "School Series." They are well-printed books, quite inexpensive, and are in many cases by well-known men. Thus the *Applied Mechanics* is by Professor Osborne Reynolds; the *Magnetism and Electricity*, by Professor Guthrie; and the *Botany* by Professor Balfour.

Dr. Thorpe's work on Chemistry fully bears out the reputation of its author, who was well known in the scientific world as an industrious worker before his appointment to the Andersonian Institution. A main feature of the work is the fact that the most recent matter in connexion with all the subjects of which it treats has been introduced. Thus (p. 14) we find mention of Sir William Thompson's views of the size of atoms; again, in discussing Hydrogenium, allusion is made to the recent remarks of Messrs. Roberts and Wright, and of Mr. Henry Watts, on the condition of the hydrogen occluded by Palladium. In every instance the most recent journals and memoirs have been consulted. The plan of the book is good. The barrier between the so-called inorganic and organic chemistry has to some extent been broken down; thus we find descriptions of such bodies as "Silicic Chloroform," and "Silicic Iodoform,"—of which names, by the way, we can scarcely approve. Neither do we see any advantage in distinguishing marsh gas, ethylene, and acetylene, by such terms as *methane*, *ethene*, and *ethine*; the two latter would often be confounded together; and if we pronounce the *i* in ethine as in *thine*, a number of words ending in *ine*, which are now pronounced as if they ended in *een*, must have their pronunciation

altered. The question of terms has long been a difficulty in chemistry, and we cannot hope for its solution at present. Dr. Thorpe's work appears to be very suitable for the upper forms in schools, and for junior university classes.

Dr. Kemshead has, we think, been less happy in the composition of his *Elementary Inorganic Chemistry*. He makes considerable use of thick-type formulae and graphic notation, which we believe is a source of great confusion to beginners. Again, he introduces many substances of small importance, the space occupied by which (in a book, remember, containing only 183 small pages) might well have been filled by more important matter. It is also, we think, unwise to use such terms as *ammonoxyl*, *potassoxyl*, and *orthoboric acid*. We must bear in mind, however, that the book has been written specially in reference to the elementary examination of the Science and Art Department at South Kensington; and although it is to our mind quite unsuitable for ordinary school work, it is no doubt found useful by the South Kensington students who are in the habit of attending Dr. Frankland's lectures.

Dr. Euer's work on Nautical Astronomy is full of concise definitions and practical examples. The exercises at the end of each chapter are judiciously selected, and have reference to examples which are worked out in the text. The book presupposes some acquaintance with trigonometry and with astronomy. To those who possess this knowledge, and who are preparing for a nautical career, the work will be found to be of service.

Mr. Simpson has attempted to get too much into a little space. A treatise on Natural Philosophy—how elementary soever it may be—can with difficulty be brought within the compass of 190 pages. At least there is no space to be lost. This book is divided into three divisions. The first division treats of the various properties of matter, then of the statics and dynamics of solids, liquids, and gases; the second division, of sound, light, and heat; and the third division, of electricity and magnetism. Concise definitions, which should frequently appear in a small treatise, are rarely met with, and the introductory historical matter at the commencement of each science might well have been omitted in a treatise of this size, the more so since they are frequently inaccurate. Thus we are told (p. 117) that the loadstone was proved to have the power of placing itself so as to point north and south before the Christian era; and that it was known to the Chinese 2,000 years before our era. The work is very incomplete in parts: thus, the great subject of the radiation and absorption of heat is treated of in less than three pages. The book does not offer any special advantage over books of the same character now in existence.

For a length of time we depended in this country on the works of Rose and Fresenius for instruction in chemical analysis. Then appeared books of a more practical turn, such as Dr. Normandy's work, and the book before us by Professor Church. Herein, after an account of chemical manipulation, and the general modes of analysis, we have a short treatise on qualitative analysis, followed by the quantitative analysis of a number of fairly common substances: manures, salts, waters, foods, sugar, milk, cheese, &c. We do not notice any new methods, but such as are described are clear and scientific: Professor Church is too well known among scientific men for us to doubt that he has selected the most appropriate method for whatever he analyses. The book will be specially useful to district food analysts, and to agricultural students.

A treatise which should give us in a comprehensive form the principal results of organic chemistry has long been wanted in this country. The great standard work of Gmelin is too cumbersome for general reference, and the admirable articles in Watt's *Dictionary of Chemistry* are not suitable for general and connected purposes of study. Hence we are quite ready to welcome Mr. Arm-

strong's book, and on examining it we find that he has furnished us with a compact little treatise which contains an account of the more prominent organic compounds, and their mode of formation. Organic chemistry, although a comparatively new science, has made astonishing progress during the last twenty-five years. Although a host of organic bodies are composed of four elements only, they outstrip in number the various inorganic substances produced by the combinations of all the sixty-four elements. Six volumes of Gmelin's *Chemistry* are devoted to inorganic chemistry, twelve to organic. New inorganic compounds are not often now discovered, while every year brings to light numberless new organic compounds. The barriers which were supposed to divide the two sciences have been almost removed: they are merging the one into the other. For formerly a body was organic when it was known only as the product of some vital action, when it was believed to be produced only in the organism of an animal or plant. But as scientific chemistry advanced, and as the number of labourers in the field was augmented, it was soon found that chemists could produce in the laboratory many substances hitherto believed to be strictly organic. At the present moment more than a thousand such bodies have been artificially produced without the intervention of any vital process. Hence we must modify our definition of so-called organic chemistry, and our author has done well in defining it as "the chemistry of carbon and its compounds," since carbon is the one *essential* element in all organic compounds. Dr. Hoffmann, if we remember rightly, has called it "the history of the migrations of carbon."

The work commences with a very brief account of organic analysis, and of the apparatus employed to effect it. Rational and empirical formulae, polymerism, metamerism, and isomerism, precede an account of the classification of carbon compounds, and then carbon itself is discussed and its simpler compounds; afterwards, the more complex compounds. We do not consider that Mr. Armstrong has made sufficient use of atomicities or of types. We should prefer to see the type and its ramifications traced, just as we write K_2O and KHO , K_2SO_4 and $KHSO_4$, on the water-type H_2O . Also, we protest against such barbarous and unnecessary names as *Tetrabromethylene dibromide* for C_2Br_4 ; and *Benzylethylbenzene* for a body which is written symbolically as $C_{15}H_{16}$. Organic chemistry can never be much studied, or studied with advantage, as a mental exercise, until it becomes more systematic and methodical, and is capable of more logical treatment. It is, however, some triumph to have reduced the main principles of the science to the dimensions of the compact little volume before us, which will be useful to medical students, to those who have to pass an examination in organic chemistry at the London University or elsewhere, and to students in a chemical laboratory who are commencing organic analysis.

G. F. RODWELL.

Transactions of the American Philological Association for 1873. (Hartford, 1874.) These Transactions consist of eight papers printed in full, together with an account of the proceedings of the Association at their fifth annual session, which contains abstracts of several other communications. The present volume has all the prominent qualities which distinguished former publications of the series—a large amount of fresh scientific matter, worked out and stated with vigour and clearness, and at the same time also with sobriety and moderation.

The first paper, on "The Epic Forms of Verbs in *aw*," by Mr. Frederic D. Allen, discusses a subject which has occupied a good deal of space in Curtius' *Studien*. Mr. Allen follows Curtius in the main, regarding forms like $\acute{\omega}\acute{\alpha}\nu\alpha\tau\epsilon\varsigma$ as having arisen from $\acute{\omega}\acute{\rho}\acute{\alpha}\nu\alpha\tau\epsilon\varsigma$ by assimilation and transfer-

ence of quantity; the intermediate form may be either $\acute{\omega}\acute{\rho}\acute{\alpha}\nu\alpha\tau\epsilon\varsigma$ (which Mr. Allen prefers) or $\acute{\omega}\acute{\rho}\acute{\alpha}\nu\alpha\tau\epsilon\varsigma$. Leo Meyer ingeniously supposed the true form to be $\acute{\omega}\acute{\rho}\acute{\alpha}\nu\alpha\tau\epsilon\varsigma$, pointing out that this lengthening of the second vowel never takes place unless it is already long by position. It might have been noticed that there is a similarly suspicious lengthening in the subjunctive of verbs in $-\mu\iota$; for we have $\sigma\tau\iota\sigma\mu\iota$, $\acute{\epsilon}\omega\sigma\mu\iota$, but $\gamma\gamma\omega\sigma\mu\iota$. Here it is difficult to avoid a view like that of Leo Meyer, viz., that the lengthening is not original, but due to an ancient confusion with the regular contracted forms.

No. II., "Studies in Cymric Philology," by Professor E. W. Evans, is a continuation of notes already published. No. III., by the late Professor Hadley, is also on a Celtic subject, namely, "Koch's Treatment of the Celtic Element in English." It is written with all the liveliness, the penetration, and the command of sound method which distinguished the lamented author. He is able to reduce very much the number of words to which Koch assigned a Celtic origin.

The fourth paper—on the Pronunciation of Latin as presented in some recent Grammars—by Professor Haldeman, notices Mr. Roby's and some others, but too briefly for practical purposes. The next is by Professor Packard, on Some Points in the Life of Thucydides. After noticing the total absence of reference to Thucydides and his work in Greek literature—a circumstance which may be due to a sort of literary fashion rather than to any causes peculiar to Thucydides—Professor Packard points out that his father's name, Olorus, seems to be Thracian: it is taken from a king of that country, father-in-law of Miltiades. The inference seems to be fair that Thucydides belonged to the family of Miltiades and Cimon, who again are connected in various ways with Thrace and the Thrace-ward positions of Athens.

The article by Professor Goodwin, on the Classification of Conditional Sentences in Greek Syntax, is excellent. The main object is to get rid of the notion that the Greek moods express degrees of "possibility" "probability," &c., and to substitute a classification founded on their real meanings. Professor Goodwin does not refer to Delbrück's work on the Moods in Vedic Sanscrit and Homeric Greek, where he would find his views amply confirmed, and the different uses historically explained.

The article of Professor March, on Recent Discussions of Grimm's Law, is chiefly devoted to examining a theory proposed by Mr. Sweet in his recent edition of Alfred's translation of Gregory's *Pastorale*. The point most in question is the pronunciation of the "thorn" of Anglo-Saxon—whether surd or sonant. Mr. Sweet had supposed it to have been uniformly sonant (= dh) and was thus obliged to suppose a series of changes which Professor March does not admit, from dh to th . Incidentally the whole subject of Grimm's Law is drawn into the discussion.

The rigorous method and the fulness of learning which characterise the volume generally are especially to be admired in this discussion.

The last paper belongs to a department for which American scholars have special advantages, namely, Indian Philology. It is a "Vocabulary of the Language of the Indians of the Isthmus of Darien," compiled by Commander Lull, of the U.S. Navy.

The Proceedings contain abstracts of some other papers of interest. Professor W. F. Allen discussed the phrase *principis dignatio* in the Germania of Tacitus, c. 13, arguing strongly for the version "favour of the *princeps*." In the other equally well-known passage about the division of land, c. 26, he translates *secundum dignationem partitur* "divide (the lands) according to a valuation of them," which can hardly be right. A paper on "Aphasia," must have been of great interest for the physiological study of language; the abstract is too brief. The same may be said of the abstract of Professor Stengel's paper on the Languages

and Dialects of Italy; and still more decidedly of a communication "On the Huron Language and some of the Huron-Iroquois Traditions." It appears that Hiawatha was an historical personage of the fifteenth century, that he formed a confederacy of various Indian tribes; that the recollection of these events is handed down by tradition, and in particular, that some of the songs then composed are still preserved, not, of course, in writing, but "by means of strings of wampum, each string varying from the others in the collocation of the beads, and every string recalling a verse." As the verses are in an archaic dialect, now partly forgotten, it will be seen what a suggestive parallel is offered to the epic poetry of other countries. We should be glad to know whether the history rests on good contemporary evidence. At first sight it reminds us strikingly of the legend of Tell. Perhaps the gentleman who is quoted as authority on the subject—Mr. Horatio Hall—will publish his researches in a complete form. The subject is one which American scholars may well make their *spécialité*.

It is worth mentioning, as a proof of the general interest felt in these things in America, that when the Association held its meeting in Providence, R. I., in 1872, gentlemen of that city subscribed 405 dollars towards the expense of printing the Transactions. It is to be hoped that the Association will be able in future to print a larger proportion of the papers read.

D. B. MONRO.

NOTES AND NEWS.

THE *Revue Scientifique* gives a long and interesting account of the researches into the respiration of plants which M. Corenwinder has communicated to the Société des Sciences de Lille. For many years the functions of the vegetable kingdom were represented as being of an opposite kind to those of animals. Plants grew to furnish food for animals, and to render animal life possible; they formed intermediate principles which animal life destroyed; animal excretions were the natural nutriments required for vegetable life, and plants purified the air which animals deteriorated; and finally, respiration, the most continuous function of our organism, was in animals a process of absorbing oxygen and evolving carbonic acid, and in plants an absorption of carbonic acid and an evolution of oxygen. The idea arising from these views was that of harmonious opposition. Claude Bernard's experiments showing the formation of one of the most important of the intermediate principles, sugar, in the liver of animals, overthrew this theory, and suggested new views in harmony with the general tendencies of science, and led to comparisons of plants and animals founded upon their resemblances rather than upon their differences. In tracing these resemblances considerable difficulties were experienced in relation to the function of respiration, and it is these which M. Corenwinder claims to have removed. The reviewer remarks that since the respiration of plants was first regarded as an exhalation of oxygen derived from the carbonic acid of the air, experiments, which are now old, materially limited the force of this explanation. It has been long known that this mode of respiration depends on the action of solar rays, and is confined to portions of plants containing the green matter chlorophyl. It was then discovered that flowers not coloured green, and even green parts in the dark, did not limit their action to absorbing carbonic acid and setting free its oxygen; on the contrary, they absorbed oxygen and exhaled carbonic acid as animals do. Hence arose the ascription to plants of two modes of respiration, one nocturnal and the other diurnal, the latter being regarded as the chief or true respiratory process. M. Corenwinder's investigations show that what has been considered diurnal respiration—viz., absorption of carbonic acid by the chlorophyl—is a digestive act, as Claude Bernard supposed, and

that the real respiration of plants resembles that of animals. Buds, young shoots, and growing leaves for a certain time absorb oxygen and exhale carbonic acid in an ostensible way and without interruption by day or night, except in the spring, when the nocturnal temperature is low, and the process is scarcely apparent. Light and heat accelerate it. As the buds or leaves grow beyond a certain point of development, this absorption of oxygen and exhalation of carbonic acid diminishes sensibly, and ceases to be apparent when they are fully grown. The amount of this action observable in any plant is proportioned to the quantity of leaf, &c., in active growth. The limit beyond which plants cease to exhale carbonic acid in an ostensible way during the day, varies much according to the species, some manifesting it a long while, others losing the faculty quickly. In the first category M. Corenwinder places *Dielytra spectabilis*, and in the latter beet-root leaves.

To ascertain why the exhalation of carbonic acid apparently ceased in adult leaves, when it ought, by analogy with animals, to be in most vigour, M. Corenwinder proceeded to analyse the leaf contents in different periods of growth. Lilac and maple leaves were used in two sets of observations extending from April 15 to October 31. The proportion of water in leaves diminishes as the season advances, but the decrease is not regular, considerable rains occasionally throwing it back. Operating upon dried leaves, M. Corenwinder found that the proportions of nitrogenous and carbonaceous matters varied according to stage of growth, and also according to the nature of the plants; maple, for example, containing more nitrogenous matter than lilac, and country trees more than town ones. Omitting the tabular statements of analyses, the general result was that during the growth of leaves, their proportion of nitrogenous to other matters diminishes rapidly. It is at a maximum when they first emerge from the bud, it lessens quickly about the beginning of July, when the fruit of the lilac is formed. After this it is slightly variable, but seems to experience a small increase as the leaves approach maturity, and is at a minimum when that period is reached. At the time of the lilac leaves falling, their nitrogenous matter amounts to about one-third of the proportion they had in the beginning; in maple it is a trifle more. The carbonaceous matter augments rapidly from the moment the leaves emerge from the buds till the completion of their growth, which in the lilac is when the flowers are nearly open. There is a slight increase beyond this up to September, and then, in maple, a sensible depression, and the maximum proportion is at the time of the fall when they have lost a good deal of their nitrogenous matter. The quantity of ash increases rapidly up to June, after which it is less pronounced. Withered leaves of maple contain less mineral matter than those of lilac, which lose a slight proportion in the course of their existence—probably through rains carrying off some of their soluble salts.

It now remains to connect these facts of analysis with the life history of the plants. During the entire growth period the nitrogenous matters are very abundant, probably organised, and endowed with an existence independent of the vegetable cells. They exercise the animal function of respiration, which then is the predominant operation. At first, the carbonic acid resulting from this process is only partly retained by the reducing action of the chlorophyl. Thus the young plant exposed to light and air exhales an excess of carbonic acid. In the second period the relative proportion of nitrogenous matters diminishes and the carbonaceous matters increase. The plant then only exhales a small quantity of carbonic acid, the bulk of it being retained by the chlorophyl, which decomposes it and fixes the carbon. At a later date the carbonic acid ceases to appear, the gas being absorbed by the chlorophyl as quickly as it is evolved

by respiration. The respiratory phenomena are then masked, and can only be revealed by indirect processes.

In an experiment of Boussingault it was found that leaves placed in a bell glass containing pure hydrogen mixed with a little carbonic acid, in a room feebly illuminated, gave out a little oxygen, showing that the assimilation of carbon had not ceased, which it only does in total darkness. It is also known that in a similar amount of light leaves in a glass full of air give out carbonic acid in inspiring oxygen; and, putting the two facts together, it appears that the two functions of the plant—respiration and assimilation of carbon—are simultaneous, but that the last becomes so attenuated that it cannot completely mask the effects of the former. M. Corenwinder finds support for his theory in the fact that the white-tufted leaves found in a variety of maize, which contain no chlorophyl, have not the faculty of sensibly absorbing carbonic acid and exhaling oxygen as the green and purple maize leaves have in sunlight; but they do exhale sensible quantities of carbonic acid in daylight. Senebier had noticed that the red and yellow tufts of the tricoloured amaranth did not give off oxygen when exposed to the sun, but that the leaves of the red amaranth had this property. So leaves naturally green, but changing to red at the end of their lives, such as those of the Virginian Creeper, completely cease to absorb carbonic acid and exhale oxygen. Faded leaves, as M. Corenwinder found, emit carbonic acid, though not as an act of vitality, but of decay. Analysing some white leaves gathered from a maple, and also green ones from the same tree, the former were found to contain in 100 parts (dried) 17.06 of nitrogenous matter, and the latter only 13.75. Thus white leaves are proportionately richer in nitrogenous matter than green ones, the latter being the richer in carbonaceous matter. Respiration he considers the function of the organised nitrogenous matter; assimilation of carbon that of organised matter chiefly, if not solely, formed of ternary compounds. For a more detailed exposition of his processes and results the original papers may be consulted. If his opinions should be confirmed we shall have the curious fact of organisms digesting and assimilating as food that which is an excretion of their own respiratory system.

We learn from the *American Naturalist* that Professor Marsh has communicated to the Connecticut Academy of Arts and Sciences the result of his researches on the size of the brain of the tertiary mammals. He finds that the Eocene mammals had small brains, in some cases scarcely larger than those of the higher reptiles. In *Dinoceras*, little less than the elephant in bulk, the brain cavity is not more than one-eighth of the average size of existing rhinoceroses. In *Tinoceras* the smallness is quite as remarkable. In the gigantic *Brontothoridae* of the American Miocene, the brain cavity is very much larger than in the Eocene *Dinoceras*, being about the size of that of the Indian rhinoceros. In the Pliocene strata of the West a species of mastodon is the largest mammal, and although but little larger than *Brontothorium* it had a much bigger brain, though not equal to that of existing Proboscideans. He found a similar progressive development in the equine mammals from the Eocene to the Pliocene periods.

THE *Revue Scientifique* contains an account of a paper on "The Tertiary Insects of France," presented to the Faculty of Sciences as a "doctorial thesis" by M. Oustalet. After alluding to various researches showing that insects have a much greater antiquity than was formerly supposed, as they have been found in Devonian strata of New Brunswick and in carboniferous formations of Claxough and Saarbrück, he gives an account of his own investigations, and describes and figures more than 100 species, some already known to M. Heer, but for the most part quite new. In Auvergne deposits he discovered small species of *hydropilus* and *dyticus*, like those now found in

ponds, and in the paper-like layers of *dusodyle* finely preserved specimens of gnats (*Bibionides*), differing in the absence of wings from the genus *Protomyia*. Besides these were larvae of stratiomys like those of *S. cameleon*, weevils, a wing of a hemipterous insect, a hymenopter, and a small nocturnal lepidopter. The fossil insects of Aix are not yet fully studied, but M. Oustalet figures sixty species of coleoptera, presenting a singular mixture of exotic types—African, Asiatic, American; those of Europe being chiefly Mediterranean. He also describes species of neuroptera, lepidoptera, and hymenoptera. From the nature of these various insects it is supposed that at the commencement of the miocene epoch central and southern France must have had a considerably warmer climate than now exists, and must have been exposed to alternations of drought and moisture.

M. Gosselet has communicated to the Geological Society of Lille the result of his examination of the Boulonnais coal-fields, and as we learn from the *Revue Scientifique* he ascribes them to the same age as those of Belgium. He distinguishes three zones, dolomite, limestone with *Productus cora*, ditto with *P. undatus*, and ditto with *P. giganteus*, and finds the same arrangement in Belgium. Below the calcareous zone in the Boulonnais is a white sandstone like the English millstone grit, containing at Hardinghen *Sigillaria calamita* and *Productus carbonarius*. The coal schists worked at Locquinghen were deposited after the grit with *Productus carbonarius*, and belong to the upper part of the Boulonnais coal measures. Many authors have regarded this coal as of the same age as the carboniferous limestone, because that formation lies over the schists, but from its flora and also from careful stratigraphical investigations, M. Gosselet supposes a very oblique gap between the limestone and the coal schists.

He considers it established that the primary strata of the Boulonnais belong to the basin of Namur, and the coal strata of Hardinghen are prolongations of those of Liège, Mons, Anzin, Béthune, &c.

M. Debray gave an account to the same society of the turf-beds on the Flemish coast. He found first alluvial soil 0.20 m., then grey clay and sand, with sea-shells and brackish water, 0.85 m., after which blue clay more or less sandy, and sea-shells 0.80 m., under which lay peat 1.10 m., and below that a bottom layer of blue clay. In the peat he found remains of horse, ox, sheep, stag, roebuck, dog, polecat, whale, cock, sturgeon, likewise objects in bronze, a tripod, spears, vases and ornaments, together with red Gallo-Roman pottery and a black pottery of the same date ornamented in relief. He thinks that the peat existed at the Roman epoch, and that the region was inhabited. The peat, he considers, formed in a lake separated by dunes from the sea, and at a time subsequent to the Roman epoch the sea broke in, deposited the clay, &c., and was subsequently excluded by human aid, and left to the limits it now occupies.

THE University of Erlangen has lost the oldest member of its professorial staff by the death, on August 21, of Dr. J. M. Leupoldt, ordinary Professor of Pathology, General Therapeutics, Psychology, and the History of Medicine. Dr. Leupoldt, who was born in 1794, had been actively engaged in lecturing since his appointment, nearly fifty years ago, to the chair of Medicine, whose duties he continued to fulfil to within a short period of his death. Beyond the sphere of his own academical activity, he was best known by his comprehensive work on the History of Medicine, which was published in 1863. The religious and philosophical point of view from which this work is written was perfectly in harmony with the general tenour of his life, and among his fellow-townsmen he was respected for the indefatigable energy with which he continued to the very last to employ his talents and exert his influence to ameliorate the condition of the poor, and to promote objects of philanthropy.

DURING the last week in August a congress of Danish physicians, more than 200 in number, met at Aarhuus. Among other points under discussion, the claims of women to enter the profession were brought forward, and were considered in a much calmer and more rational manner than usual. The Congress came to no definite determination on the subject, but it listened with patience to the members who pleaded the cause of female students, and the general feeling at the meeting seemed to be that there was nothing to prevent women from treating the diseases of their sex with ability and success, while in the matter of obstetric practice it was in the highest degree desirable to transfer it completely from the hands of common midwives to those of women duly certificated by the University.

ANOTHER philological pamphlet from the untiring Whitley Stokes in Calcutta. This time it is *Some Remarks on the Celtic Additions to Curtius's Greek Etymology by Professor Windisch*. Thirty-five pages of royal octavo are devoted to a kindly but keen criticism of the German professor's errors of commission and omission in his additions to the fourth edition of Curtius's great work. The faults committed arise mainly from Windisch's misplaced trust in his predecessors. The faults of omission are given in twenty-seven pages of Celtic words which the critic wishes to include under certain of the roots or groups given by Curtius. To these he adds a mention of some of the phonetic changes in which the Neo-Celtic languages resemble Greek; and then a list of thirty-eight Greek words which have apparently their cognates in the Celtic languages, but are not fully treated in Curtius's book. Lastly—for Dr. Stokes is the "correctingest" of men—three pages of Corrigenda for the second edition of his *Goidelica*.

THE current number of the *Zeitschrift für Wissenschaftliche Theologie*, so ably edited by Professor Hilgenfeld, of Jena, contains the following articles:—"Polycarp of Smyrna," by the editor: an attempt to show, against Keim and Scholten, that Polycarp was really a disciple of John the Apostle and the seer of the Apocalypse, but that he contributes no evidence to the Johannean authorship of the Fourth Gospel. "On *εἰς τὸν* with the Infinitive in the Epistles to the Romans and Corinthians," by E. Harnsen: this refers to Meyer's note on Rom. i. 20, who takes a view which is opposed by many leading expositors. Harnsen quotes and examines all the New Testament passages bearing on the question. "The Dependence of 1 Peter on Romans," by W. Senfert. "On 2 Cor. xi. 32, 33," by C. Holsten, one of the most eminent of the younger liberal theologians, who seeks to prove that these two verses are an interpolation. "Hartmann's *Philosophie des Unbewussten*, its Gnosticism and Metaphysical Value," by A. Schweizer, the venerable and distinguished follower of Schleiermacher.

THE *Monatsschrift für Geschichte und Wissenschaft des Judenthums* (Jan.—Aug.) appeals to such a limited circle of readers in this country, that several valuable contributions to biblical criticism are in danger of being overlooked. Of the articles relating to special Jewish literature it is unnecessary for us to speak. Among the Old Testament papers we may single out four by the learned editor, Dr. Grätz:—"On the Meaning of the Word *ammin* in Biblical Literature" (*ammin*, not only "nations," but "tribes," as in Deut. xxxii. 8, Ps. lxxvi. 8, Zech. xi. 10, 1 K. xxii. 22, 28, Mic. i. 2, Ps. lxxxvii. 6, Zeph. iii. 9, Deut. xxxiii. 3; sometimes even "people"—*Leute*—as in Joel ii. 6, Judg. v. 14, Lev. xix. 6); "Misunderstood Passages in Genesis" (on Gen. xii. 6, and the parallel passages—a specimen of the impetuosity and opiniativeness which too often deform the works of this scholar); "On the Verb *masak* and its Derivatives" (attempt to show that *masak* is another form of *nasak*, "to

pour." We doubt whether this theory can be made to fit Ps. cii. 10); "The Beginning of the Chaldean Dominion over Judea" (shows, *inter alia*, that Jehoiakim's revolt did not follow at once on the battle of Carchemish, but that four years probably intervened; also the roll which was burned by Jehoiakim contained only the prophecy in chapter xxv. The common view, that it was a collection of prophecies, is opposed by the statement of the prophet in xxxvi. 29, and based on a misunderstanding of xxxvi. 2, "From the day I spake unto thee . . . unto this day," words which ought to be written with quotation commas; they refer to the opening words of the prophecy in chapter xxv.).

SOME time ago we noticed an edition of Jerome's translation of the Psalter—which is distinct, of course, from that in the Vulgate—published by Professors Tischendorf and Delitzsch, and Dr. Baer. By a singular coincidence, Professor de Lagarde, of Göttingen, was at that very time carrying through the press an edition of the same version, which has now appeared, and may be procured, at the moderate price of 1½ thaler (4s. 6d.), by writing to Professor de Lagarde. Only a small number of copies have been printed. Four manuscripts, and where necessary the older editions, have been carefully collated; among the former is a codex of the tenth century, which closely resembles the famous Codex Amiatinus, of which a collation was recently published by Dr. Heyse. The name of Lagarde is a guarantee for the accuracy of the text.

THE second volume of Albrecht Ritschl's work on *The Christian Doctrine of Justification and Atonement* (Bonn: Marcus) has just appeared, and will amply reward the student of exegesis, as it is entirely occupied with the interpretation of the Biblical passages relating to this doctrine. We hope it will not wait too long for a translation.

THE second half of the new edition of Dr. Delitzsch's great work on the Psalms has also appeared (Leipzig: Dörfeling und Franke). It is superfluous to say that the learned author's passion for accuracy is as conspicuous here as in his other works, notably in his attention to etymology and synonyms. The conscientiousness, too, with which he reports and briefly criticises the opinions of other scholars is deserving of warm recognition. His critical and exegetical point of view, which we must not be supposed to recommend, is of course unchanged. The present volume is accompanied by an accentuological commentary on the first three Psalms; this is substituted for the elaborate dissertation by the Masoretic scholar, Herr Baer, which adorned the two previous editions. There are also two excellent indices to the notes on etymologies and synonyms, which will give an idea of the harvest the careful student may gather.

DR. JOSEPH KARABACEK, of the Vienna University, has recently published a very interesting work entitled *Beiträge zur Geschichte der Mazjaden*. The subject is an Arabic inscription which was discovered at Bosra in the Haurán, by Dr. P. Politzer. The inscription informs us that the building on which it was engraved was a Deyr (or convent), and a place of pilgrimage; and that the Amir Dubey, the son of Sadakah, ordered that it should be visited, and that a certain Surkhak had endowed it. The latter may or may not be a historical personage; but the Amir Dubey, the Mazyadi, descended from the old Arab tribe of the Bení Asad, is well known in the history of the Crusades, in which he played a very prominent part.

The palaeographical examination of the inscription does no little credit to Dr. Karabacek's learning, and is an important addition to our knowledge of the history of the Arabic character, the most beautiful existing. This critical examination of the inscription is followed by a historical account of the dynasty of the Mazyadi, which will be found very valuable. The work ends with a genealogical table and three lithographic plates.

FINE ART.

The History of Music (Art and Science). Vol. I. From the Earliest Records to the Fall of the Roman Empire. By W. Chappell, F.S.A. (London: Chappell & Co., 1874.)

To write the History of Music for the period covered by this volume is a task which calls for several attainments not often found together. It is almost a truism to say that the study of Greek music requires a knowledge of Greek history and the Greek language; but so little has been done by scholars for either the text or the interpretation of the *Scriptores Musici* that no ordinary amount of scholarship is required. On the other hand, the historian of music should know not only music itself, but also the leading principles of acoustics; that is to say, of the invariable facts of nature on which every possible art or science of music must be based.

Mr. Chappell has a good share of these various qualifications. He is a thorough musician, with sympathy for the less familiar styles. He has read the Greek musical treatises to good profit, and though his scholarship occasionally shows an amateur's touch, he is incapable of the sort of mistakes which occur in every other page of M. Fétis. He has a fair acquaintance with ancient history; but when he has to deal with evidence, we become aware of a certain want of familiarity with the methods of historical enquiry. It may seem paradoxical (or worse) to say so, but probably Mr. Chappell would have done better to take his history straight from Grote, without going back to Diodorus and Plutarch at all. His weakest side, however, is the physical theory of music. Scientific readers will be apt to shut the book in the middle of the Preface when they are told that Helmholtz's great book on the *Tonempfindungen* displays a number of "curious misconceptions," that it is a "hasty book," that Helmholtz misunderstands the meaning of the words consonance and dissonance, and the like. Mr. Chappell's theory is evidently the fruit of his own reflexion, and as such, does him no discredit; for it is the theory first proposed by Euler, and universally accepted, until it was disproved by Helmholtz. Hence the quotation (at p. 237) from Sir John Herschel gives Mr. Chappell no real support; it merely shows that the Discourse on the Study of Natural Philosophy was written before the date of Helmholtz's discoveries. It is singular, certainly, that Sir John Herschel should speak with so much confidence of a theory which he himself, with Helmholtz's proofs before him, would have been the first to give up.

Scientific readers will understand that this part of the work, however erroneous, need not materially affect the value of the rest. Indeed, the chief reason for calling so much attention to it is, that Mr. Chappell himself has made it so prominent. His real and great merit lies in the clear and sympathetic account which he has given of the Greek system of music. Before we come to this, however, it is necessary to say something of an historical theory, also extraneous to the subject of Greek music, but which some of Mr. Chappell's readers may find

almost as great a stumbling-block as his scientific views. He believes that Greek music, at least in its later form, was derived from Egypt, when that country was opened to intercourse with Greece in the seventh century B.C. In this, indeed, there is nothing *prima facie* improbable. The old fashion of deriving everything Greek from "the East," led to a reaction which asserted the absolute independence of Greek genius; but the latest writers on these subjects have recognised that a nation like the Greeks may be thoroughly original and creative, and yet have borrowed the rudiments and (so to speak) the alphabet of their art—the implements, the materials, the manual skill—from an older civilisation. The question therefore is, Do the Greek instruments and the Greek divisions of the scale show sufficient traces of an Egyptian origin? I venture to think that Mr. Chappell's arguments will be regarded by most students of history as quite insufficient. Passing over what he quotes regarding the early intercourse with Egypt, the travels of Greek philosophers, &c., as too vague and uncertain, his positive arguments seem to be these:—

1. "Nicomachus, quoting Pythagoras and Plato, tells us that the Egyptians ascribed twenty-eight sounds to the universe. That is the precise total number of Greek notes in their greater and lesser perfect systems combined." This is a "remarkable coincidence," but, in the first place, Nicomachus is a late writer, and the "Pythagoras" whom he quoted was in all probability spurious. Next, the number 28 is a perfect number, and might have been applied to the universe on mathematical, not musical grounds. Finally, the Greek 28 notes cannot have been transplanted bodily from Egypt, as the argument requires, because the nomenclature is evidently founded on a simple Octave System, with fresh names coined as they were required by the Greeks. The lowest note, for instance, called *Proslambanomenos*—the "added"—was certainly added in Greece, not in Egypt.

2. In the treatise *Περὶ Ἑρμηνείας*, ascribed to Demetrius Phalereus, there is a passage which Mr. Chappell takes to mean that "in Egypt the priests hymn the gods through the seven notes of the scale," accompanied by the pipe and the kithara; and he compares this with a Greek vase-painting in the Museum at Berlin, No. 626, on which four priests are represented, two playing on the lyre and two on pipes, with letters written all round them which seem to be A E I O. The coincidence surely is very slight, even when we have given the proper rendering of *διὰ τῶν ἑπτὰ φωνηέντων*, viz. "through the seven vowels," not "notes of the scale." They are called *γράμματα* directly afterwards. I may add, without professing to explain either the passage or the vase-painting, that the priests on the vase are not very like Greeks, either in face or in dress.

3. The Museum at Florence contains part of an Egyptian flute, described by M. Fétis in his *Histoire de la Musique*. A copy having been made at his desire, it was found that the interval between the highest and lowest note was a fourth, and that the six sounds of the instrument formed a chromatic scale.

Mr. Chappell supposes this scale to be the result of inaccurate measurements: he takes the six notes to be those of a Greek tetrachord, "when it includes the enharmonic quarter-tone and the chromatic semitone for change into those genera." Before arriving at this conclusion—and certainly before using it as a proof that Greek music was of Egyptian origin—Mr. Chappell should have satisfied himself of the inaccuracy of M. Fétis's facts. It would not be difficult to obtain a fresh and accurate measurement at Florence.

4. Herodotus identifies the Egyptian lament for Maneros with the Greek song called "Linus." "Identity of song argues identity of system of music. There could be no such identity between a boat-song of the Nile and any European air now." It seems very doubtful what the likeness amounted to which struck Herodotus. It does not follow from his words that the two songs were sung to the same air.

Mr. Chappell's account of Egyptian musical instruments, illustrated by careful engravings from monuments, is most interesting, but it certainly does not bear out his view as to the derivation of the Greek music of the seventh century B.C. from Egypt. Certain instruments, such as the *Magadis*, appear to have been borrowed; but most Egyptian instruments—especially the harp and lute—are unlike anything Greek.

When we reach the Greek octave system we are on comparatively firm ground. The Greek single octave, Mr. Chappell shows, was the same as the modern minor scale, except that "it began on the fourth below the key-note and ended on the fifth above it." But when the Greeks extended their scale to two octaves, their arrangement was the same as ours. "They added a Fourth to the top and a Fifth to the bottom of their one-octave scale" (p. 84), and thus turned it into two octaves, with the *Mesê* or key-note in the middle. These additions, however, were made gradually, and the primitive heptachord system of "conjunct" tetrachords—E up to A and A up to D (with B flat)—was still retained. Thus arose the two "perfect" systems of the technical writers, the Greater System consisting of two octaves, and the Lesser System of an octave from A (the key-note) downwards, and a tetrachord from A up to D, with B flat instead of B natural.

The great puzzle of Greek music has been the nature of the modes. Did they differ in pitch only, like the keys on a modern piano, or were they scales, differing as the major and minor do, in the order of the intervals? Mr. Chappell decides that the modes are simply keys; and as an interpretation of the ancient authorities his view seems clearly right. The fifteen modes were so many repetitions of the two perfect systems, the pitch rising in successive semitones. Such was the theory until the time of Ptolemy. But when we ask whether every Greek air was in one of the minor keys, we are met by further and more difficult questions. The character of music depends not so much on the scale of notes used as on the relation of the melody and harmony to the "tonic" or key-note. Had the Greek the strict tonality—the subordination to a tonic—which distinguishes modern music? Mr. Chappell

is fully aware of the importance of this question. "The secondary meaning of *Mesê* as key-note is far more important than the primary; for it has afforded a far greater insight into Greek music than the mere fact that it was originally the middle string of the lyre" (p. 101). Accordingly he quotes a passage from the *Problems* of Aristotle, in which the *Mesê* is spoken of very much as a modern musician would speak of the key-note. If *Mesê* is out of tune the whole scale is out of tune; all good composers use *Mesê* constantly: "when they quit it they return to it quickly, but to no other in a similar way." This language certainly goes far to prove (in opposition to Helmholtz's view, and also to the conclusions of Westphal) that the *Mesê* was in the full sense a key-note, and consequently that all Greek music was in one or other of our minor keys. There is one point, however, in the passage of the *Problems* which should make us hesitate. The prominence of the key-note would hardly be said now to be characteristic of good music; it is a fixed rule, which applies to every piece of music alike. Aristotle's words rather make us think of a state of the art in which strict tonality was confined to the better class of compositions—a merit, not a necessity. This suspicion, again, falls in with other indications of a want of tonality, and of the existence in Greek practice, if not in theory, of other scales besides the minor.

In the first place, it is obvious to ask whether Aristotle's account of the position of the *Mesê* applies to the conjunct system. If so, the scale may be represented by that of A minor, with B flat instead of B natural. Now, the use of B flat may imply either a modulation into D minor, or the use of the scale which Helmholtz calls the Dorian—a scale which differs from the minor by having a flat second. Mr. Chappell would probably accept the latter alternative; for out of the three specimens of Greek music which have survived, two are referred by him to keys of this very kind. One, the Hymn to Calliope, is printed in G sharp minor, with A natural above it; the other, the Hymn to Apollo, is in C sharp minor with D natural. The scale, therefore, is not exactly that of the minor, though it has a minor character; it is that which will be found analysed by Helmholtz under the name of Dorian.

Mr. Chappell's account of the Hymn to Nemesis enables us to go a step further. He observes that "although noted like the others in the Hypo-Lydian mode, which at the original pitch is C sharp minor, it is rather in what we term its relative major, viz. in E. It is so according to Aristotle's laws as to *Mesê*, and, except for D natural, would be so by modern laws." [There is some oversight here, for Mr. Chappell has printed the music of the Hymn with D sharp throughout]. "The hymn" he concludes "is essentially in a major key, and is another of the many instances in which the ear has guided to what is right, against the musical laws of ancient times." That is to say, the nominal *Mesê*, the *Mesê* to which Aristotle's laws ought to have applied, is C sharp, but the real or natural *Mesê* is E, and the scale used is the Hypo-Phrygian of Helmholtz, the modern major with a flat seventh.

Two conclusions of much interest follow

from these facts: first, that Greek music had distinctions analogous to that between major and minor, and secondly, that these distinctions were not made according to, but in spite of, their system of tonality. Greek musical laws recognised at most the minor and the Dorian scales; and if their rules as to the key-note had been strict, they could have had no other. But with an imperfect tonality they were guided by musical feeling to scales either the same or nearly the same as the modern major.

The half-conscious use in practical music of scales which had not found their place in the theory, will go far to explain the importance attached to the so-called "species of the octave," i.e., the different successions of intervals which can be taken on the scale of any one key—see the tables given from Ptolemy on pp. 112 and 113. The same consideration will also help us materially in dealing with certain scales given by Aristides Quintilianus, which Mr. Chappell seems to regard as the mere fancy of a late writer. They are six in number, all in the Enharmonic Genus (i.e., they use intervals of a quarter of a tone), and are given as the six modes or scales (*hyporiat*) discussed by Plato in the *Republic*. They certainly show an imperfect tonality: two of them are not octaves; and they cannot be reduced in all cases to the standard minor scale. In spite of this, or rather, perhaps, because of this, it is difficult to believe that they are the fruit of mere error, or of later fancy. Before condemning them altogether Mr. Chappell should look at the chapter on the subject in Westphal's book, *Harmonik der Griechen*, a book which he does not seem to have used in writing his own. The scheme given by Meibomius is not very accurate, being taken from inferior manuscripts.

An imperfect tonality is incompatible with anything beyond the merest rudiments of harmony, and we are therefore prepared to find scanty references to that part of music in ancient writers. The most important passage is in the *Laws* of Plato, and is quoted and translated with perfect accuracy by Mr. Chappell (p. 144). His version, it will be seen, agrees with that of Professor Jowett. The other references are chiefly found in Aristotle's *Problems* and Plutarch's *Dialogue on Music*, and are given with equal correctness. We rather miss a summing-up—an estimate of the place of harmony—in Greek music. Mr. Chappell rightly decides that the Greeks knew and used both consonance and dissonance, but he does not point out the limits within which harmony was used.

There is no good evidence of the use of chords or of vocal harmony, except singing in octaves, or of any general acquaintance with simple kinds of harmony. And this is only what we expect from other characteristics of Greek music. Their want of tonality, the variety and delicacy of the intervals used in their melody, the simplicity and mechanical poverty of their instruments—these things hang together (as Helmholtz admirably shows) in the same way that the lofty roof of a Gothic church depends upon and implies the use of massive columns and buttresses.

The paragraphs touching on Greek musi-

cal notation at the end of Chapter viii. might be enlarged with advantage into a full account of that curious subject, in which Westphal has made some remarkable discoveries. Mr. Chappell will find that the notes used for instrumental music are of high antiquity, and yet involve the full recognition of the octave; also that they throw much light on the comparative antiquity of the three Genera, the Enharmonic, Chromatic, and Diatonic. In short, Mr. Chappell's book, excellent as a beginning, and sound in its main conclusions, leaves room enough for addition and improvement in the future editions which we hope he will have occasion to publish.

D. B. MONRO.

La Faience à Emblèmes Patriotiques du Second Empire. Par Ludovic Pichon. (Paris: Manginot-Helittasse). The emblematic pottery of the French Revolution has been fully described in the entertaining work of M. Champfleury; but these patriotic effusions terminate in 1795, and only revived in 1804, under the First Empire, when millions of plates were circulated with the one subject, the eagle and thunderbolts, and were eagerly bought by the peasants as bearing the emblem which had led them to victory. The Restoration produced only one design, a pallid reproduction of the Rouen *corne d'abondance*, with the motto "Les lis ramènent la paix." The monarchy of July introduced vulgar impressions of lithographs with subjects laudatory of the Citizen King. Here, M. Champfleury places the term of emblematic faience, but it appears to have risen again with the Second Empire; the object of M. Pichon's little book being to announce that he has in his possession a plate, of which he gives a woodcut, made in 1852, at Périgueux, by M. Champeaux, a potter, representing the imperial eagle surrounded by two olive branches, and underneath, 7,500,000, the number of the *plébiscite*. A second specimen has been since found with the number of the *plébiscite* encircled by branches of laurel, and he states that large quantities were exported to the north of France, and were bought by the peasants of Périgord, who, as M. Pichon says, while eating their meals and reading the inscription on their plate, would triumphantly exclaim "I too am one of the 7,500,000 who elected the Emperor." F. BURY PALMER.

NOTES AND NEWS.

MR. LAYARD, our English minister at Madrid, who is a great admirer and collector of ancient pottery and glass, has just presented some remarkable specimens of old Muranese glass, of the time of Charles V., which he has found in Spain, to the Museum of Murano.

ONE of Mr. Foley's latest portrait-statues—that of John Stuart Mill—will, it is stated, shortly be placed on the Victoria embankment.

THE autumn exhibition of the Birmingham Royal Society of Artists is now open. It comprises as many as 673 works of art, and is reported by the local papers to be above the average of provincial exhibitions. Pictures to the amount of 2,000*l.* were bought on the private view day.

GREAT progress, the *Builder* states, is being made with the restoration of Warwick Castle. Workmen are now busily employed in laying the floor of the baronial hall, for which twenty tons of red and white marble have been brought from Italy. The armour, though much damaged by the fire, was not destroyed, and will again serve to decorate this splendid hall.

THE Vienna papers assert that the triple sarcophagus of Attila has been discovered at Tisza Zoff, in Hungary. About half a league below Roff some fishermen found in the bed of the Theiss,

about eighteen feet from the shore, a place where, on striking with poles, a ringing sound was produced resembling that of brass. The length and width of the object discovered suggests the idea of a coffin, and why not the triple coffin of gold, silver, and iron of the King of the Huns, whom history relates to have been buried in the bed of a river of Hungary? The village of Roff also bears the name of the uncle or brother of Attila. When the waters of the Theiss have become lower further researches will be instituted.

M. HENRY HOUSSAYE, the writer of an article in the *Revue des Deux Mondes* on "The Ancient Paintings in the Museum of Naples," appears not to have read with advantage, if at all, the recent works of M. Helbig on the mural paintings of Campania. He has produced, in consequence, an article which, though doubtless very agreeable reading to those who have passed hours of pleasant observation among the paintings in question, is yet a highly unsatisfactory article for those who have once become acquainted with the searching investigations of Helbig. It is the part of a cicerone to applaud in detail the beauty of the objects to which he calls attention. It is the part of an archaeologist like M. Houssaye to point out the importance of the paintings which he describes as illustrative of a particular stage in the development of ancient painting. It is too late in the day for us to be addressed in exclamatory phrases when a theory advanced by a man of undisputed eminence, and supported by a powerful array of facts, is waiting to be either further confirmed or assailed. Under these circumstances, a leaf from a tourist's note-book, however sweetly written, is only irritating.

THE large model of Windsor Castle, carved in cork (according to scale), lent by Mr. Lloyd Hopkin, of Philadelphia, for exhibition in the South Kensington Museum, has been followed up by the production of smaller models, by the same artist, of Holyrood Palace, Fountains and Tintern Abbeys, and the Church of Stratford-on-Avon. Although all honour is given to the fine model of Windsor by its exhibition in a special room of the annexe to the south of the Horticultural Gardens, it is to be regretted that space has not been found for it in the Architectural Court of the Museum, where it would be more readily seen.

THE discovery of the remains of Leonardo da Vinci, that was announced so positively in several of the Paris papers, and the news of which was telegraphed to England, turns out to be no new discovery after all, but only a resuscitation of the old bones found by M. Arsène Houssaye in 1863. The Government at that time erected a small monument to the memory of the great painter at Amboise; but the dubious bones were not interred in it, and appear to have remained unnoticed until quite recently, when the Comte de Paris gave orders that they should be placed in a leaden coffin, and buried in the chapel of St. Hubert, in the castle at Amboise, with the following inscription:—"Sous cette pierre reposent des ossements recueillis dans les fouilles de l'ancienne chapelle royale d'Amboise, parmi lesquels on suppose que se trouve la dépouille mortelle de Léonard de Vinci, né en 1452, mort en 1519.—1874." Hence the whole story. The *on suppose* somehow got left out in the newspaper versions of it.

MM. JULES BRETON and Paul Dubois have been elected honorary members of the Academy of Vienna.

THE new Oriental Museum at the Palace of Compiègne was opened on August 17, and is composed of the fragments of sculpture and casts from the monuments of ancient Cambodia, principally brought over by Lieutenant Delaporte. It is scarcely ten years since the travels of Henri Mouhot, a French naturalist, made known the existence on the territory of Siam and Cambodia of temples, pagodas, and statues, in the midst of forests, and almost concealed by the luxuriance of

tropical vegetation, evidences of a powerful civilisation at remote periods of which it is impossible to fix the approximate date. Mouhot died in the midst of his explorations, and, in 1867, Captain Dondart de Lagrée was sent out on an expedition to Cambodia, and in company with Francis Garnier explored the ruins of Angkor, and took photographic views of some of the monuments. The importance of their researches may be best estimated by referring to their great work, published on their return at the expense of the Minister of Marine. These three enterprising travellers are all dead. In 1873, Lieutenant Delaporte was named to an exploring expedition to Cambodia, with directions to send to France all the sculptures and fragments of sculpture he could collect, either among the monuments at Angkor, already partially seen by his predecessors, or among the neighbouring monuments not yet explored by Europeans. Accompanied by some engineers and naturalists, they reached Saigon in July, and through extraordinary difficulties, and by prodigies of energy, the little party succeeded in arriving at these masses of ruins defended by impenetrable forests. More than twenty groups of colossal monuments were reached during their six weeks' stay, photographs and plans taken, and large fragments of sculpture detached and transported through a desert country without roads. This valuable collection reveals to us a new field for study, an architecture highly finished and varied in detail, with the monstrous combinations of Asiatic art. The Minister of Public Instruction has given it a place in the vast galleries of the Palace of Compiègne.

In repairing the pavement of the cathedral at Rouen, there has been discovered in the centre of the nave a heart enclosed in a leaden box. M. Deville, the historian of the tombs of the cathedral, thinks that the heart may be that of Sibylla, wife of Robert II., Duke of Normandy.

THE Retrospective Exhibition of Costumes has just received the addition of seven panels of tapestry illustrating the history of Jeanne d'Arc, lately found in the old Château of Espanel, near Molières (Tarn-et-Garonne). A large proportion of silk has been used in the making. They appear to be of the seventeenth century.

A RING has recently been presented to the Bishop of Briec, with the motto "Qui me nomme me perd," alluding to his speech in which he says "La France a besoin de silence."

THE fine painting of Palma Vecchio, *The Adoration of the Shepherds*, has been restored to its place in the Louvre, after being carefully cleaned and re-varnished. The authorities have also removed the two false signatures of Titian, which had no doubt been affixed to enhance its value when the picture was sold, in 1685, to Louis XIV., for 2,218 livres.

THE Commission of Historical Monuments has lately examined a plan for the new covering of the roof of the Maison Carrée at Nîmes, which consists in lightening the timber work and in reconstructing the tile covering with antefixa, according to the ancient types. The estimated cost is 520*l.*, which the Minister of Fine Arts considers should be defrayed by the town of Nîmes as coming under the head of repairs. The municipal council have deferred coming to any decision for the present, as the roof is in no immediate danger, and any repairs would be better executed after the transfer of the pictures to the new museum.

THE receipts of the Alsace-Lorraine exhibition are estimated at 8000*l.* It was closed on the 31st ult.

THE new fountain at the end of the avenue in the Luxembourg Gardens has just been set up, the centre consisting of a graceful bronze group by Carpeaux of the four quarters of the world supporting the globe. Near it has been lately placed a beautiful marble group by Jouffroy, or-

dered by the City of Paris: the subject "L'Espérance relève le Courage du Laboureur."

A MEDAL was sold at St. Anne d'Auray, where Marshal MacMahon attended mass, with the following inscription, "Pax, Lux, Rex, Lex."

THE fountain of the Château d'Eau is just completed. It consists of a basin on a level with the ground, and above a second basin separated from the first by three steps, over which flows a cascade of water. Then comes a large shell, supported by brackets; and lastly, a patera placed on the shaft of a column. The only ornaments of the fountain are the heads of an Indian Bacchus.

SCHWIND'S *Schöne Melusine* has just been bought by the Emperor Francis Joseph for the Royal Gallery of the Belvedere at Vienna. Herr Paul Neff, of Stuttgart, to whom this picture belonged, has been for some time past in treaty with several of the German museums for its sale. The Belvedere Gallery has not hitherto contained a single work by Schwind, although Vienna was his native town, and the Emperor may be congratulated on having made such an important acquisition. The *Schöne Melusine* is one of Schwind's most striking works. It was bought for 20,000 thalers.

THE Crown Prince of Germany has lately been elected honorary member of the Berlin Academy.

THE *Journal Officiel* has recently published an important series of articles on "Flemish Art at Dijon in the time of the Dukes of Burgundy." They are by the well-known writer on Flemish art, M. Alfred Michiels, and will form, it is stated, a portion of his report to the French Government on his tour of inspection and exploration in the East and South of France. Some new and interesting particulars concerning the Flemish sculptor Claus, or Claes Sluter, who, as De Laborde discovered, was appointed valet de chambre to the Duke of Burgundy in 1393, are made known. The two concluding volumes of M. Michiels' *Histoire de la Peinture Flamande* will, it is announced, soon be published.

"PARIS," says *La Liberté*, "is at the present moment going mad on the subject of ceilings." This will be readily understood when it is stated that the exhibition of M. Baudry's frescoes for the new opera-house is now open at the Ecole des Beaux-Arts. Everybody is rushing to see these much-talked-of works, and the papers are filled with exulting paeans in praise of Baudry in particular, and French art in general. "The arts in France," writes one patriotic critic, "are in such a flourishing state that the chronicler becomes embarrassed by the abundance of matter offered to him." The *Gazette des Beaux-Arts* has been for some months past occupied with M. Baudry's designs, but its illustrations give only a slight idea of the gigantic nature of this monumental work.

Dr. KOSCH, of the Chemical and Technological School at Vienna, has made an interesting discovery, which consists in the fact that certain colours may be made fire-proof, and may thus be used for painting on china in precisely the tones required. The inventor has prepared a palette, on which his coloured enamels may be used like ordinary oil-colours, and may be painted in in every conceivable combination of tints without being in the slightest way altered by the action of fire. Dr. Kosch at the same time makes use of a specially prepared enamel, which he spreads over the surface to be painted on, and by which the irregularities and porosities of the porcelain are as thoroughly

concealed from view as if they were covered with thin smooth fine linen. The importance of such a surface-medium will be fully understood by all who are practically conversant with the difficulty of preventing the irregular and undue absorption of colour, which has hitherto stood in the way of producing artistic and carefully toned effects of colour on porcelain. This method has nothing in common with the "engobe" of M. Deck and other French ceramic artists, which requires to be strongly varnished or glazed before the colours can be submitted to the action of fire; and when Dr. Kosch has succeeded in adding a few more delicate tints of blue and green to his present range of colours, the important results of his ingenious invention will undoubtedly be speedily apparent. Under the direction of the Imperial Museum, some beautiful imitations of Delft and Urbino majolica have already been made, in accordance with this method, at Messrs. Glowak and Klammer's porcelain works at Znaim. Another and scarcely less interesting invention, for which Austrian art is indebted to Dr. Kosch, is the fusion of gold, silver, and platinum with bronze, by which the most gorgeous effects are produced; gold-fusion giving to the metal a splendid violet tint, silver a faintly-lustrous "Kioto" tone, and platinum a rich and deep black shade. The intermediate tints may be obtained by modifications of heat, while the same process may be applied with nearly equal success for cast iron. Dr. Kosch has succeeded in producing very novel effects by laying on one tone upon the other, as, for instance, coloured leaves and variegated arabesques on differently-tinted metallic surfaces; and his method is beginning to be extended to the ornamentation of leather, thus bidding fair to revive, at a moderate cost, the art of preparing leather mosaics, which owed its origin to Grolier, and is one of the most elegant of the numerous artistic adaptations of inexpensive materials to artistic purposes for which the sixteenth century was distinguished.

In the *Gazette des Beaux Arts*, M. Clément de Ris, who seems to have emulated Mr. Beavington Atkinson's *Art Tour in Northern Capitals*, gives us a description of the National Museum of Stockholm, and especially mentions two or three Swedish painters whose names are now almost forgotten, but who had a certain amount of celebrity in their day. The first of these—Alexandre Roslin—is represented in the museum by one of his best works, *Gustavus III. and his Two Brothers discussing the Plan of a Campaign*. Roslin was born in Sweden in 1720; but he, as also A. Wertmüller (whose portrait of Marie Antoinette and her children is given in etching), lived and worked in France, and belongs essentially to the French school in style.

In another article on Museums, M. Eugène Véron reviews the Lyons Museum, and criticises the works of the Lyons school, which he considers has flourished under different conditions at three different periods.

M. Louis Courajod offers some remarks that will interest collectors on the prints attributed to Bramante. Many of these are, he considers, falsely so attributed, but the great architect of St. Peter's no doubt executed works with the burin as well as with other implements.

"La Toga de Talma" is the title of a practical exposition of the toga as worn at Rome in the time of Sylla, Caesar, and the first emperors. The celebrated actor Talma, it seems, once took the place of his tailor, and determined to cut out a toga for himself. He had studied the question from every side, and at last succeeded in making one that fulfilled all the needed conditions—the same, in fact, that is worn to the present day at the Théâtre Français. This is "the toga of Talma" described by M. Valmore, who gives full directions how to cut it out and put it on.

The other articles of the number are for the most part continuations. The illustrations are abundant, but not remarkable.]

As frontispiece in the *Portfolio* this month, we have an etching by Ch. Waltner of Gainsborough's beautiful portrait of Orpin, parish clerk of Bradford, Wiltshire, in the National Collection. The usual biographical sketch by R. N. Wornum accompanies the etching. It is a pity that Mr. Wornum will not take the trouble to make these sketches a little more vivid and interesting. As it is, he does little more than rewrite his notices in the *Epochs* and the National Catalogues, notices that cannot be too highly appreciated for their knowledge, judgment and careful compilation of facts, but that are necessarily somewhat dry reading. In the *Portfolio* we might, at all events, expect something a little more critical. Why not refer to the National Gallery Catalogues for the facts? The melancholy poetry of a *Winter Landscape* by Ruysdael loses none of its sentiment in the etching by Brunet-Debaines. The original picture, we are told, is in the possession of Mr. Max Kann, and that is all that is known about it. Mr. G. A. Simcox, in an article on Art and Antiquarianism, considers the difficulties in the way of restoring old churches: "It really cannot be proved to any one who has the rudimentary courage to ask for a reason, that the one proper thing to be done with an old building is to leave it alone," says Mr. Simcox; and, failing this proof, we have simply to decide how the building will look best for the rest of the time it is to stand. A somewhat difficult decision to arrive at in the present uncertain state of opinion regarding architectural beauty and fitness.

Mr. Beavington Atkinson continues his essay on "The Witness of Artists to the Beautiful;" and Mr. Hamerton, besides "The Sylvan Year," gives us some interesting information respecting Adrien Guignet, an imaginative French landscape painter, whose works are very little known in England. Gautier places him between Salvator Rosa and Decamps.

THE STAGE.

"FROU-FROU" AT THE HAYMARKET THEATRE.

THIS is not the occasion for a eulogy of Aimée Desclée. But among the lovers of her genius who go to the Haymarket Theatre to see an excellent performance in English of *Frou-frou*, there are few who will not be more sharply than ever reminded of the gap made in dramatic art by her death. It is impossible to study the character which she loved best, and which is always associated with her name, without recalling her looks, her gestures, and the tones of her voice; the looks with which the guilty wife accompanied her words, "Une heure de colère et voilà où j'en suis arrivée:" the gestures which gave life to her jealousy of her sister, "Tu t'es occupée de mon mari, tu t'es occupée de mon enfant, mais moi?" and the tones in which she arrested her husband as he goes to shoot her lover, "N'y va pas: je t'aimerais." No actress had such a marvellous power of concentrating passion into a glance. Each look was a drama. One is not likely to forget how the feelings of disgust, bewilderment, and self-pity were mingled in her face when she uttered the words of Claire, the heroine of Sardou's *Maison Neuve*: "Voilà mon idéal: il est gris." No actress moved so slowly and gradually towards her object of stirring the emotions; none concealed so thoroughly the machinery by which she worked. Those who saw her performance of Frou-frou, when the play of MM. Meilhac and Halévy was first produced at the Théâtre du Gymnase five years ago, left the theatre knowing that there was genius in the piece: but whether the genius belonged to authors or actress it was difficult to determine. So entirely had Mdlle. Desclée infused her mind into the character, and so skilfully had she hidden the process.

The point has now been long settled. The play is dull because it is ambitious, it is commonplace because the authors have overreached themselves. MM. Meilhac and Halévy write excellent pieces

of buffoonery, and are skilful contrivers of little comedies played in a single act. They occupy a position on the French stage analogous to that occupied by Colman and Foote on the English stage: they have more fancy than these writers and less observation. It would be as reasonable to ask the author of the *Heir-at-Law* to create Rosalind or Miranda, as to ask the authors of the *Grande Duchesse* to paint any woman other than a woman of the world. Nevertheless, their intentions have been misrepresented. It was said that there was little or no motive for Frou-frou's elopement, and a critic suggested that a play would next be written on the subject of a lady running away from her husband because he neglected her poodle. The authors laid themselves open to this charge by working out their idea of the heroine with insufficient skill. The idea was evidently that of a butterfly creature of fashion, giddy, superficial and unprincipled, the balance of whose character was so unstable that the ordinary weight of motives was not needed to sway it. She married in a moment's caprice, she eloped in an hour's anger. Moreover, the dramatists have frittered away the force of several episodes which were necessary to give logical consistency to the play, by turning them into farcical incidents. Add to this crudity of workmanship a want of philosophic insight into human character, a want of profundity and true wit, and it will be seen that *Frou-frou* will not find place among the best works of the contemporary playwrights of France.

Gilberte Brigard does not live in an atmosphere of high morality. Her father is a vain libertine: her intimate friend, the Baronne de Cambri, "la poupée la mieux équipée de Rome à Paris," takes her to see the historical houses where truant wives have had the intolerable imprudence to let themselves be found by their husbands: the Baron de Cambri, is a man of equable temperament, who, if he regrets that his wife has no heart for him, at least rejoices that she has none for his neighbours, and carries her daily pile of love-letters with calmness: and among Gilberte's devoted admirers is Count Paul de Valréas, who says that he is sitting at the cross-roads where pleasure and virtue part company, but who is generally believed to have already travelled some distance along the road of pleasure. But she does not marry him. She is persuaded by her sister Louise, who herself loves the man she is recommending, to marry a diplomatist, M. Henri de Sartorys. In the first four years of her new life she finds amusement in scandal and intrigues, in private theatricals and *débardeur* costumes, in wearing Circassian dresses at the opera, riding a velocipede in the Bois, or incurring a hundred thousand francs of debt in a fortnight. What more could be asked of her than that she should be the prettiest, most courted, most admired woman in Paris? It could not be expected that the fashionable M^{me}. de Sartorys should carry her child's hoop in the gardens of the Tuileries. So she lets Louise take her place in the family circle, tend her child and care for her husband. At last she is seized with a mad fit of jealousy, makes one effort to regain her lost position, finds that she is treated as a child or as a mistress, and flies with Valréas. Her husband follows her to Venice to shoot her lover. She would stop him, throws herself before him, and cries, "Deux hommes s'entre-tuer à cause de moi, Frou-frou. Songez donc, Frou-frou: des fêtes, des chiffons, toute ma vie était là. C'est pour cela que je suis faite, pour cela seulement. Un homme comme vous se batte pour une femme comme moi?" But he kills Valréas and forgives his wife when she returns to die.

Mdlle. Beatrice is a charming Frou-frou. The character is so rudely fashioned by the authors, that the more credit is due to Mdlle. Beatrice for carrying with all the moods of Gilberte the entire sympathy of the audience, in her wayward fancies, her reckless follies, her mad resentment, and

her shame. It is an artistic performance, and the details have been carefully elaborated. There is a world of regret in her voice when she speaks of Paris and its delights, after her husband has been offered an appointment at Carlsruhe. She cannot conceive Paris without Frou-frou, and her husband cannot conceive Frou-frou without Paris. Very delicate, too, is the scene where she tries to coax her weak husband into allowing her to assume the duties of wife and mother. And a fine contrast is drawn between her sullen apathy when he puts her off with a jest, and the storm of passion in which she is tempted to tell Valréas that she loves him. Her violent nature, uncontrolled and uncontrollable, is never so strikingly depicted as in this scene. She is flinging her arms around the neck of Valréas, when the door opens and her mood changes. She has now only words of compassion for him: "Si j'étais frivole, comme on dit, et coquette et mauaise, je vous garderais près de moi, et cela m'amuserait de vous faire souffrir." She has these sophistries always at hand. To herself she is always a spoiled child, and her sins are charming faults. But she is bad at heart: bad in that she neither loved husband nor lover, father nor child; bad in that she hardened herself against her sister's defence; bad in that she had no idea of moral obligation. When Valréas was dead she devoted herself to the poor, and wore black dresses; but Sartorys justly said that it would be as reasonable to bid the poor curse her because she forgot every wifely duty to him, as to bid him forgive her because she tended the poor. This is a view of the character brought into relief by the praiseworthy performance of Mdlle. Beatrice, who seems to have grasped its meaning with fullness and precision.

The rest of the company have been excellently schooled to subordinate their action, or on occasion to bring it to the front. Mr. Wenman stands out among them as a comic actor of considerable power. His effects are somewhat coarse, and his facial play monotonous; but he has a clear and humorous conception of the part of Brigard, in which M. Ravel was distinguished. There is a very droll scene in which a couplet from an ancient vaudeville stirs Brigard recollections of Déjazet and Achard, and sets him dancing as he danced thirty years ago at the student's balls. But the facetious libertine is out of place at his daughter's death-bed. Of course Mr. Wenman is no more responsible for this incongruity than Mdlle. Beatrice is responsible for the daub which mars the conclusion of the play, when the dying Gilberte bids her sister dress her in a ball-robe covered with rose-buds, and dies saying, "Toujours la même: Frou-frou, pauvre Frou-frou."

WALTER MACLEANE.

THE Alhambra Theatre has produced a grand spectacular piece called *The Demon's Bride*. The words are written by MM. Vanloo and Leterrier, and adapted into English by Mr. H. J. Byron, and the music is composed by M. Georges Jacobi. It is the most gorgeous blaze of light that has been seen in London since Mr. Boucicault revived the national drama. But it is hard to see why so original and versatile a dramatist as Mr. Byron should have gone to French authors for a story which is free from improprieties, and the incidents of which he might have gathered from an Ingoldsby legend or constructed in a nightmare. A band of gipsies have fixed their quarters in the castle of the Landgrave of Filastinish, and their leader, taking advantage of the belief that the castle is haunted, and of the fact that the ladies of his company look exceptionally well in bright colours, and that there is a large supply of red fire in the theatre, pretends to daemonic powers, and by means of them carries off the daughter of the landgrave from her lover Karl, who is also Secretary of State. Karl has thus leisure to indulge his remarkable powers of imagination, and he does not employ them in regulating cabs and public-houses, as other secretaries would have done, but he

dreams of ballets at opportune moments, of Stars of Hope as represented by the *première danseuse* flitting over the stage with many-twinkling feet, of Lightning as impersonated by the ballet-master, of Aerolites and *coryphées* and Grand Adagios, and even of a *pas de charmes*. But his imagination does not extend to the frenzied gymnastics of Mdle. Sara, who lays claim to the rare gift of being able to raise her foot higher than any lady in the theatrical profession. The gipsy-demon, finding that dances of this character are common at the castle of the Landgrave, very properly restores the daughter of such an abandoned potentate. The music to which M. Jacobi has set the story is exceedingly sprightly. M. Jacobi's inventive faculty is like the Aeolian harp, on which every passing air can make music, and yet differs from that instrument inasmuch as he has a preference for the airs of Offenbach. The dresses are the most artistic that Mr. Alfred Thompson has ever designed; and altogether the Alhambra Theatre is not likely to change its programme before Christmas.

ON Thursday night Mr. Watts Phillips's drama *Lost in London* was revived at the Princess's Theatre, with Mr. Emery, Mr. Belmore, and Miss Lydia Foote in the parts originally sustained by Mr. Neville, Mr. Toole, and Miss Neilson respectively. Mrs. Mellon resumes her original character. We reserve notice of the performance.

AN interesting event will take place to-night. Mr. Albery's comedy *The Two Roses* will be revived at the Vaudeville Theatre with Mr. James as Our Mr. Jenkins in place of Mr. Honey, Mr. Farren as Digby Grant in place of Mr. Irving, Mr. Warner as Jack Wyatt in place of Mr. Montague, Mr. Righton as Fumival in place of Mr. Stephens, Miss Larkin as Our Mrs. Jenkins in place of Miss Lavine, Miss Kate Bishop as Ida in place of Miss Newton, and Miss Amy Roselle as Lottie in place of Miss Fawsitt. Mr. Thorne will once more appear as Caleb Decie.

TO-NIGHT Mr. J. S. Clarke appears at the Adelphi Theatre in *Red Tape*, *Toodles*, and *Among the Breakers*.

ON Monday next *The Two Orphans*, by Mr. John Oxenford, will be produced at the Olympic Theatre; *The Island of Bachelors*, by Mr. Reece, at the Gaiety Theatre; *Hal o' the Wynd*, by Mr. Rae, at the Standard Theatre.

NEXT Saturday Mdle. Beatrice will appear in *Nos Intimes*.

Giroflé-Girofla is shortly to be played in English at the Philharmonic Theatre.

THE Théâtre de l'Odéon, Paris, has revived Dumas' play, *La Jeunesse de Louis XIV.*, with a new actor named Gil-Naza in the part created by Lafontaine. The Théâtre du Gymnase has revived *La Dame aux Camélias*, with Mdle. Pierson as Marguerite Gautier. The Théâtre de l'Athénée, Rue Auber, has opened under the name of the Théâtre Scribe.

THE new National Theatre at Copenhagen, which has risen by the side of the one just destroyed, the history of which is given in this month's *Cornhill*, will be opened on September 25. The first representation will consist of Holberg's popular old comedy of *The Lying-in Room*, with a new prologue by Ploug, followed by a new dance-poem by the indefatigable Bourdonville. The greatest of living Danish actors, Herr Wiehe, has sufficiently recovered from his serious illness to undertake to pronounce the prologue.

THE Association of German Theatricals counts at present as many as 5,385 members. In its three years' existence, its funds (subscribed by the members themselves) have reached the amount of 160,000 thalers. Of this sum, 58,000 thalers have been expended in the purchase of a house in Charlottenstrasse, Berlin, where the offices of the Association are now located, while the remainder

of the capital is invested in first-class securities. The fund increases progressively from year to year; so that in the year 1881 the Association bids fair to have a million of thalers at its disposal.

MUSIC.

GLOUCESTER MUSICAL FESTIVAL.

THE "Festival of the Three Choirs" of Gloucester, Worcester, and Hereford is an institution which has existed so long, and is so generally known, that our readers will doubtless not require any detailed information as to its history or nature. Established upwards of a century and a half since (the present being the 151st meeting), the object of the festival is, in the words of the programme, "to raise funds for the benefit of the widows and orphans of poorer clergy within the Dioceses of Gloucester, Worcester, and Hereford; aided by the Diocesan clerical charities, the proceeds have of late years averaged to each widow twenty pounds, and to each orphan fifteen."

The annual meeting of the choirs is held alternately at the three cities above-named, the management being in the hands of a committee of honorary stewards who make good any deficit in the expenses if these should not be covered by the sale of tickets. For the benefit of the charity, a collection is made in the cathedral at the close of each service or performance, and it is only from this source and from subsequent donations that the objects of the festival are carried out.

An excellent orchestra, composed largely of our London players, and numbering nearly sixty performers, is engaged. Among the best known names in the published list are those of Messrs. Sainton, Carrodus, Dando, T. Watson, Willy, R. Blagrove, E. and J. Howell in the stringed department, and Messrs. Radcliff, G. Horton, Lazarus, Hutchins, C. and T. Harper among the wind. The chorus numbers about 300 voices.

A very curious rule prevails at these festivals with respect to the conductorship. The organist of the cathedral in which the festival takes place is *ex officio* the conductor, while those of the other two cathedrals preside at the organ and piano respectively. On the present occasion, Dr. S. S. Wesley, the organist of Gloucester Cathedral, is therefore the conductor, Mr. G. Townshend Smith, organist of Hereford Cathedral, takes the organ, and Mr. Done, of Worcester Cathedral, the piano. The functions of a cathedral organist and of an orchestral or choral conductor are so dissimilar that it is not surprising if a musician who may be admirably qualified for the one should show himself by no means equally fitted for discharging the duties of the other.

It will be obviously impossible within the limits allowed me in these columns to speak in detail of each of the seven performances given at the festival. All that is practicable, or indeed desirable, will be to refer to some of the more salient features.

After two long rehearsals on Monday, the first of which, for the sacred music, took place in the cathedral, and the second, for the secular music, in the Shire Hall, the festival itself opened on Tuesday morning with Divine service in the cathedral. At one o'clock the festival performances commenced, the programme consisting of Spohr's *Last Judgment* and Weber's (so-called) sacred cantata, *The Praise of Jehovah*. Spohr's oratorio—the best, beyond all doubt, of the four he composed—is with its English name wrongly christened. The German title "Die Letzten Dinge" means rather the latter days, or the end of the world, than the Last Judgment; and though this, no doubt, is partly the subject of the work, it forms comparatively a small portion of its contents. The whole of the first part treats of the visions of the Apocalypse; while the second part deals with the Last Judgment and its premonitions, the destruction of "Babylon the Mighty," and the creation of a new heaven and a new earth.

While fully admitting the exquisite beauty—nay, even the power—of many portions of the work, it is impossible to allow that Spohr has risen to the height of his theme. The first part of the work, the adoration of the Saints and Elders, is in parts transcendently beautiful—almost grand; but as soon as the composer comes to deal with the awful realities of the last day, his genius appears to collapse, and instead of the crash of doom, we find only theatrical effects. The long bass solo, "Thus saith the Lord," in which this subject is treated, is the least effective and most laboured part of the oratorio. Moreover, even in the best parts, Spohr's mannerisms are too apparent; and the luscious sweetness of his chromatic harmony, charming at first, becomes cloying after a while.

The rendering of this oratorio on the present occasion was one to be remembered through a lifetime; and few who were fortunate enough to be present will forget it. There is always a certain element of chance in concerts. Sometimes after the most careful preparation an unfortunate *contretemps* will spoil the performance; at others it seems impossible for anything to go wrong. So it was here—movement after movement went with a precision, an attention to light and shade, and a spirit which could not be surpassed; equal praise being earned by principals, chorus, and orchestra. The solo parts were admirably given by Miss Edith Wynne, Miss Sterling, Mr. Lloyd, and Signor Agnesi. Especial mention should be made of the duet "Forsake me not," exquisitely sung by Miss Wynne and Mr. Lloyd; and of the two quartetts with chorus, one in the first and one in the second part, which count among Spohr's happiest inspirations.

Weber's cantata *The Praise of Jehovah* is an adaptation to English words of his celebrated "Jubel Cantate," written in 1818 to commemorate the fiftieth anniversary of the accession of the then King of Saxony. Being in its original form a secular rather than a sacred work, the alliance to such a text as that of *The Praise of Jehovah* cannot be considered other than a mistake; and, in fact, much of the charming music with which the work abounds sounded entirely out of place in a cathedral. Still the cantata is so full of life and spirit, and so characteristic of its composer, that, appropriate or inappropriate, one could not but enjoy it. The solos were taken by Mdle. Titiens, Miss Griffiths, Mr. Bentham, and Mr. Lewis Thomas. Where all were good it seems invidious to select any one for special praise; but mention ought to be made of Mdle. Titiens' superb singing of the air "O praise the Lord," and also of Mr. Thomas's artistic rendering of the prayer, "Send thine angels down to guard us." The performance was doubly enjoyable from the absence of encores and applause; and while listening it was impossible not to wish that these nuisances were as inexorably forbidden in St. James's Hall as they are in Gloucester Cathedral.

Tuesday evening's performance comprised the first and second parts of the *Creation* and Rossini's *Stabat Mater*. Concerning such well-known and often-heard works, but little beyond a record of the facts need be given. The soprano solos were in the hands of Mdle. Titiens and Miss Edith Wynne; the former lady taking those of the first, and the latter those of the second part of the oratorio; while the tenor and bass solo parts could not have been better sung than they were by Mr. Lloyd and Mr. Lewis Thomas. Both orchestra and chorus were excellent.

To those who, like myself, are not above enjoying "naked, absolute, ear-tickling melody" (as Wagner calls it), the performance of Rossini's ever-popular *Stabat Mater* with such a cast of principals as Mdle. Titiens, Mdme. Trebelli-Bettini, Mr. Bentham, and Signor Agnesi was a real treat; and, in fact, a finer rendering of the work as a whole has seldom been heard. The chorus-singing, too, was exceptionally good, especially in the difficult unaccompanied chorus, "Eia mater," the precision and correct intonation of which left

absolutely nothing to desire. The same can hardly be said of the quartett "Quando corpus," which was in parts painfully unsteady. As a matter of statistics, it may interest readers to learn that 730 persons were present at the morning performance, and 1,106 in the evening; and that the total sum collected at the two services and the two performances amounted to 244*l.* 1*l.* 3*d.*

Wednesday morning was devoted to the *Elijah*, a work which has been so often criticised that it would be absurd to enter into details respecting it here. The performance was under the circumstances remarkably fine; indeed, considering that it was given without rehearsal, the steadiness and spirit of the choral portions reflect the greatest credit on Dr. Wesley, who conducted with a decision and clearness that conduced largely to the success of the whole. Of course there were occasional slips; it would have been strange had there not been in so long and elaborate a work; but the effect of some of the choruses, especially "Yet doth the Lord see it not," "Thanks be to God," "Be not afraid," "Behold, God the Lord passed by," and "Holy, holy," was magnificent. The part of the prophet was sung by Signor Agnesi. This careful and talented artist appears to less advantage in oratorio than in operatic and florid music; and though (as always) correct and painstaking, failed in producing a great effect in the part. The same may be said to some extent of Miss Sterling in the contralto solos. As an exponent of the songs of Schubert, Schumann, and the modern German school, this lady has few equals, and perhaps no superior; but oratorio music seems hardly her forte. The soprano music was divided between Miss Edith Wynne and Mdlle. Titiens, the former taking the first and the latter the second part of the work. In the scene between the widow and Elijah Miss Wynne sang admirably, while Mdlle. Titiens produced a grand effect in the "Hear ye, Israel," and even more in the wonderful "Holy, holy." The tenor music was divided between Mr. Lloyd and Mr. Bentham, the former gentleman carrying off the honours by his charming performance of "If with all your hearts." The subsidiary solo parts were taken by Miss Griffiths (a very promising young singer, with a pleasing voice and a good style), Mrs. Smith, Messrs. Hunt, Poole, and Merrick.

On Wednesday evening the first of two miscellaneous concerts was given in the Shire Hall. Space will not allow more than the briefest mention of it. The prominent items were a large selection from *Don Juan* (in which Mdlle. Titiens, Miss Edith Wynne, Mdme. Trebelli-Bettini, Mr. Bentham, Mr. Merrick, and Signor Agnesi took part), the "Jupiter" symphony, and the last two movements of Beethoven's E flat concerto, excellently played by Miss Agnes Zimmermann, and enthusiastically received by the audience. Special praise must also be given to our admirable violinist, Mr. Carrodus, for his masterly rendering of Ernst's fantasia on *Otello*, and to Miss Sterling, who created a *furor* by her singing of three songs by Schubert, Schumann, and Mendelssohn.

Two works were brought forward on Thursday morning—Mendelssohn's *Hymn of Praise* and Rossini's *Messe Solennelle*. The former is among the best known and most popular of its composer's works; and it is probable that never in this country, or perhaps even in Germany, has a finer performance of it been heard than that to which I this morning had the pleasure of listening. The singing of the chorus was perfection itself, while the solo parts received ample justice from Miss Wynne, Miss Griffiths, and Mr. E. Lloyd. The opening symphony was given by the band with a finish and delicacy which would not have disgraced Mr. Mauns's orchestra, and the promise of this commencement was fully sustained till the close of the work. Especially remarkable were the *pianissimo* passages for the chorus in "I waited for the Lord," which are so seldom given with the requisite refinement, and, in a different way, the following chorus, "The night is departing," which

went with a fire and spirit which could not be surpassed. Dr. Wesley may be heartily congratulated on a most splendid performance.

Rossini's *Messe Solennelle*, the composer's latest published work, forms as strong a contrast to the *Hymn of Praise* as can well be imagined. While Mendelssohn's music may be considered a representative Protestant work, Rossini's Mass can be no less taken as a type of the sensuously beautiful Romish ritual. Though unequal in many parts, it contains passages of great beauty; its chief faults are over-extension in the songs and a predominance in some portions of the theatrical style; among the best numbers are the "Kyrie," the "Crucifixus," the "Sanctus," and the "Agnus Dei." The performance on the present occasion was an admirable one, hardly, if at all, inferior to that of the *Hymn of Praise* above mentioned. The solo parts were given to perfection by Mdlle. Titiens, Madame Trebelli-Bettini, Mr. Bentham, and Signor Agnesi, while the band and chorus left little to desire, though the performance fell somewhat short of that absolute perfection by which the preceding work was characterised.

This evening (Thursday), after the despatch of this letter, the second miscellaneous concert will be held, the chief features of which will be Mendelssohn's *Midsummer Night's Dream* music, and a selection from Weber's *Oberon*. To-morrow morning the *Messiah* will be given in the cathedral, all the principal vocalists taking part in it; and the festival will be brought to a close in the evening by a choral service, when a sermon will be preached by Canon Barry. EBENEZER PROUT.

We have just learned that a new series of symphony concerts, besides the two Philharmonic Societies, will be given next winter in St. James's Hall. The *entrepreneurs* are Herr Karl Meyder, the new musical director at Drury Lane, and Mr. Arthur Chappell, the well-known music publisher. Herr Meyder, who has distinguished himself already as a bandmaster in the English army, will have the artistic management in his hands, and conduct the concerts, which are to be given on a grand scale every Wednesday afternoon, commencing at the end of October, during the whole of the next season. The conductor intends to produce works by artists who, although of great merit, are not generally known in England.

The first concert, for instance, is to be inaugurated with an overture by the Dresden Hof-Kapellmeister, Herr Carl Krebs, the father and teacher of Marie Krebs, the distinguished pianiste. Some works by Taubert (whose *Liebesliedchen* created such a *furor* when produced at the Crystal Palace last winter), by Rheinberger, Bruch, Brahms, &c., are also to be produced. Arrangements are being entered into with instrumental performers of the first rank to appear at these concerts, and some of the best vocalists of our concert-room have already promised their assistance. Herr Meyder has engaged an orchestra with upwards of sixty excellent musicians, with Herr Spielmann as "leader," Herr Rudersdorff for violoncello, &c. The young enterprise, therefore, shows every chance of success, and we hope that Mr. Chappell's Wednesday afternoon performances will be worthy brothers of his Monday Popular Concerts.

THE programme of the Leeds Musical Festival, which is announced to take place on the 14th, 15th, 16th, and 17th of October, is of considerable interest. The chief works to be given are the *Messiah*, St. Paul, a selection from *Israel in Egypt*, the *Loggessing*, Macfarren's *St. John the Baptist*, Rossini's *Stabat Mater*, Schumann's *Paradise and the Peri*, and Smart's *Bride of Dunkirk*. The most important instrumental works announced are the "Jupiter" and "Pastoral" symphonies, and Handel's First Organ Concerto, to be played by Dr. Spark, the organist of Leeds Town Hall. The list of principal vocalists includes the names of Mdlles. Titiens and Singelli, Mmes. Alysleben,

Trebelli-Bettini, and Patey, Messrs. Sims Reeves, Lloyd, Bentham, and Santley, and Signori Campanini, Perkins, and Agnesi. The band and chorus will number 360 performers. Sir Michael Costa will be the conductor, and Mr. James Broughton the chorus-master, while Dr. Spark will preside at the organ.

THE hall of the new Opera House at Paris, which, as we mentioned in last week's ACADEMY, is to be opened on January 1, 1875, is to be lighted in conformity with the old system by a great central chandelier. The entire building, including both the exterior and interior, will be lighted by 8,400 gas burners, while it will be heated by means of twelve huge furnaces placed in the cellars. The height of the house from the underground basement floor to the roof is 210 feet, or about 12 feet greater than that of the tower of Notre Dame. The theatre has seats for 2,194 spectators. The green-room, dressing-rooms, and all the adjoining galleries and saloons are being decorated in the most modern style, and the grand staircase, which is finished, merits special admiration for the beauty of its balustrades, and the effective combinations of its white and coloured marbles. The great vestibule is being appropriately decorated with sitting figures of Lulli, Rameau, Gluck, Handel, and other composers.

VIRGINIE DEJAZET, who appeared before the public on the occasion of the seventy-first anniversary of her *début* at the Théâtre des Capucines, at the age of five years, has returned to Montmartre in very indigent circumstances.

A NEW tenor, Ladislaus Mierjerski, a Pole, has just been engaged, and will make his first appearance as Raoul in the *Huguenots*. He is twenty-seven years of age, tall, handsome, and with all the vivacity and exuberance of manner of "les Marseillais du Nord," as the French call the Poles.

LITERATURE.

The Life of Napoleon III., derived from State Records, from unpublished Family Correspondence, and from Personal Testimony. By Blanchard Jerrold. With Family Portraits in the possession of the Imperial Family, and Facsimiles of Letters of Napoleon I., Napoleon III., Queen Hortense, &c. In Four Volumes. Vol. I. (London: Longmans, Green & Co., 1874.)

AN HISTORIAN has always a difficult task. Man is so constituted that it is impossible for him to occupy his mind for a length of time with an individual, a nation, or an age, without his sympathies becoming enlisted on one side, without his heroes becoming the objects either of his admiration or of his hatred. If this tendency to one-sidedness is true of those who deal with the great men of antiquity, how much more true is it of those who undertake to describe the actions of a contemporary? It demands a real effort of will to speak impartially of Alexander, Caesar, or Nero: it is almost beyond our power to make this effort in writing the history of a man whose ashes are scarce cold, and whose acts have led to consequences which are still felt in the most direct manner by those very persons who are called to be the judges of his conduct.

Mr. Blanchard Jerrold, in the few lines of preface which introduce his work, tells us that his object is to "set forth impartially the great drama" of the life of Napoleon III. Has he been really impartial? I think not, and I think his book ought to be ranked, not among histories, but among panegyrics. The good faith of the author cannot be doubted for a moment; a tone of profound conviction prevails throughout the entire volume; but his sincerity only shows more clearly that it is a panegyric which he has written. Impartiality is nowhere to be found.

Shall I myself be impartial in the observations which I believe it my duty to offer? The reader will judge. I have, however, a confession to make. At this moment there are in France, scarcely more than two classes of men—those who regret the Emperor, and endeavour to erect again for his son the throne which fell at Sedan; and those who have vowed a bitter hatred to Napoleon. In the view of these latter the Emperor was a man who did two things: he corrupted and degraded France by the despotic rule to which he condemned her for twenty years; and, for an interest purely personal, or, at any rate, purely dynastic, he delivered her up to the horrors of an invasion which, after unprecedented disasters, has cost her five milliards of francs and two of her most industrious, most enlightened, and best-loved provinces. The consequences of the misfortunes of the terrible year still press on France with their

whole weight, and the vast majority of Frenchmen have not forgiven this.

I am one of this majority. Therefore it is not without much self-distrust that I have undertaken to review Mr. Jerrold's book. I have nevertheless endeavoured to repress my private sentiments regarding the hero of this work, to confine myself to the compass of the first volume which goes no further than 1837, to forget the scenes of mourning and of blood which I have myself witnessed in my own country, to blot from my memory the image of the Prussian flag which I have seen waving over the forts of Paris, and to restrict myself exclusively to remarks suggested by the book itself. The reader will judge whether they are well founded.

The first chapters of the volume are devoted to an account of the family of Napoleon III., and especially of the Empress Josephine, Queen Hortense, and King Louis. These portraits are skilfully set in an attractive description of Malmaison, the "Sans Souci of the First Consul." The author has drawn this description and these portraits from the best sources, viz., the recollections, memoirs and correspondence which the imperial family has placed at his disposal. The picture may, perhaps, be suspected of some exaggeration, but it must be acknowledged that Mr. Jerrold has dexterously steered clear of the rock which necessarily presented itself in the very beginning of his course. Louis, King of Holland, and his wife, Queen Hortense, were on very bad terms with each other. Mr. Jerrold acknowledges this, and nevertheless sets to work to praise them both. He passionately admires the Queen—all the while acknowledging (what, indeed, is indisputable) that she was guilty of the most grievous wrongs against her husband which a wife can commit. He bestows much praise on the King, while he points out several defects in his character, and attributes the matrimonial disagreements to mere incompatibility of temper. All this is skilfully expressed, dexterously arranged, but leaves the reader in doubt as to one thing. He will ask himself, if the King possessed all the great qualities ascribed to him by the author, and the Queen was endowed with all the charms and virtues of which Mr. Jerrold has so lively an impression, how it happened that husband and wife could never come to an understanding, but ended by a separation, and by the reference of their disputes to the courts of justice, thus creating a public scandal.

This question raises another still more delicate, but which Mr. Jerrold has passed over in silence. In relating the birth of Napoleon III. he reproduces the semi-official account current in Imperial circles, without discussing it, without even leaving any room to suspect that it was disputable, and that it had been contested.

It is nevertheless very certain that there is more than one objection to this account. It was at all times matter of dispute whether King Louis was really the father of the third son of Queen Hortense, and the King himself denied it. When he left Holland he retired to Styria. M. Decaze was commissioned to draw up a memorial, stating all the reasons which ought to induce the brother of Napoleon I. to return to France.

King Louis refused to return, and sent the memorial back to M. Decaze with his own remarks in the margin. One of these bears directly upon the point in question, and the King states that one of the motives which hinder his return to France is the fact that he is not the father of the child who afterwards became Napoleon III. The son of M. Decaze, now Minister of Foreign Affairs to the French Republic, possesses a copy of this memorial.

These facts are well known, and by many Frenchmen it is considered certain that Napoleon III., son of Hortense Beauharnais and of . . . , never had a drop of the blood of the Bonapartes in his veins. Those who are of this opinion call attention to the fact that the features of Napoleon III.—not as they have been portrayed by Court artists, but as seen by all his contemporaries, and as reproduced with unerring exactitude by photography—in no respect recall to mind those of the first Emperor. They add that the same thing is as true of his character as of his features. It is stated that, one day, receiving at a farewell audience one of his generals on whom he had just conferred an important embassy, but about the vivacity of whose character he was a little uneasy, Napoleon III., summing up briefly the whole of his instructions, said to him, "Remember, this world belongs to phlegmatic intelligence." Whether the tale be true or not, the epithet well describes the character of the reputed speaker. Constrained in action, of gloomy aspect, cold, methodical, slow to comprehend, and still slower to decide, taciturn to such a degree that his enemies used to say of him, "This man never speaks, and always lies," not a bad-hearted man at bottom, and often showing signs of a weak character, Napoleon III. did not either by his defects or his talents in the least recall to mind Napoleon I., whose impetuous genius, hard and violent character, and prompt, decisive mind, resolute even to rashness, live so distinctly in the remembrances of those who knew him.

I ought to state that while many very well-informed Frenchmen assert that Napoleon III. was quite foreign to the race of the Bonapartes, there are others whose impartiality is unquestionable who maintain the contrary. The question will, doubtless, never be decided: a panegyrist like Mr. Jerrold could scarcely approach it, but it will necessarily engage the attention of future biographers of his hero.

I do not know whether the lengthy details which the author gives concerning the youth and education of Louis Napoleon will excite much interest in England. In France, where this monarch-worship is unknown, they will be thought rather puerile. The author, always enthusiastic, works himself into an ecstasy; but the sayings which he quotes, and the letters which he reproduces, contain nothing very remarkable, and it does not appear that the youth of the future Emperor was marked by any striking proof of superiority.

Mr. Jerrold also praises the military talents of the prince, proofs of which our biographer would make out that he had given in Italy during the insurrection of 1831 in which he took part; but Mr. Jerrold's own account shows that this insurrection gave rise to no

military action of so decisive a character as to have enabled the prince to display the talents with which he credits him.

The whole book is written from a Bonapartist point of view, so the monarchy of July is criticised with extreme severity, one may say with evident injustice. There is, doubtless, ample reason to reproach Louis-Philippe: it may be said that his policy was often mean and always selfish, that his undeniable shrewdness frequently lacked sincerity; but it is incontrovertible that during his reign France enjoyed real prosperity and sufficiently ample liberty. It also cannot be denied that Louis-Philippe was for a long time popular. The Bonapartist party, however, has another way of representing matters. In order to justify the enterprises at Boulogne and Strasburg it is forced to maintain that France was wearied of the government of July; that she felt herself oppressed and debased, and was quite ready to welcome as a deliverer the man who presented himself as heir of the great Emperor. Mr. Jerrold far too readily and far too unreservedly accepts this assertion, which is quite contrary to historical truth.

Under the restoration the Liberal party had sought a basis of operations against the Bourbons in the recollections of the Imperial era. It had invented the legend which represents Napoleon I. as a Liberal of a special kind, as a crowned revolutionist, who took on himself the mission of propagating the doctrine of '89 throughout all Europe at the cannon's mouth. This legend was still in vogue in the time of Louis-Philippe, who submitted to its influence, and contributed to its propagation when he replaced on the top of the Vendôme column the statue of the Emperor wearing the traditional cocked hat, when he completed the triumphal arch at the Barrière de l'Etoile, and demanded from England the remains of the Emperor, that they might be conveyed with great pomp to the Invalides. But these facts, far from confirming the assertions of the Bonapartist party, might, on the contrary, serve to refute them. Louis-Philippe would, in fact, have done nothing of all this had he entertained the smallest apprehension of an Imperial restoration, had he thought that the Bonapartists could ever prove dangerous to his dynasty. In fact, no one in France thought at that time that a Bonaparte could ever reascend the throne. The vast majority of Frenchmen, even of educated Frenchmen, were unaware even of the existence of Louis Napoleon, and the Strasburg escapade was needed to teach them that somewhere there existed a young man who gave himself out to be the heir of the great Napoleon, and aspired to sit upon his throne.

All the latter part of Mr. Jerrold's first volume is devoted to an account of the preparations, incidents, and results of the attempt at Strasburg. The author entirely adopts the views of the Bonapartist writers who serve as his guides. He thinks that the enterprise offered considerable chances of success; that the Strasburg garrison was ready to rise at the name of Napoleon; that the civilians were animated with the same feelings; that if the Prince had been able to make himself master of the town he would

have been joined by the garrisons of Alsace, Lorraine, and Champagne; and that he would have succeeded in entering Paris at their head, perhaps without burning a cartridge, like Napoleon on his return from Elba.

I believe all this to be pure fancy, and that the Strasburg attempt, alike foolish and criminal, offered no serious chance of success. Napoleon I. was able to return from the isle of Elba because there lay behind him twenty years of dazzling victories, and before him a country irritated beyond expression by a government introduced by foreigners which threatened to destroy the social achievements of the Revolution, to restore their old privileges to the nobles and the priests, to seize again the national property from those who had acquired it. But in 1836 Louis Napoleon was an unknown young man, without any past history or popularity; France was calm, and, on the whole, satisfied with its government, and the daring act of 1815 could not have been repeated.

From another point of view I find a grave omission in Mr. Jerrold's work, and I shall take the liberty of bringing against him a reproach in which, doubtless, all English readers will coincide with me.

The Strasburg attempt was not merely mad, it was criminal. To rise against a government which is recognised, established, and accepted by the nation is deemed a crime by all civilised nations, and it really is a crime. Fortunate England has seen no revolution for nearly two centuries. We Frenchmen, who have passed through so many, know what revolutions cost, and what a dreadful amount of suffering of all kinds they inflict on a nation. So we do not easily forgive those who cause them—either the conspirators who contrive them, or the kings and ministers who lead to them by their political blunders. On the day when young Louis Napoleon tried to overthrow Louis Philippe, and for the sake of his own ambition to effect a revolution in peaceful and prosperous France, he sank to the rank of a criminal.

There is one kind of revolution which we in France specially detest above all others, viz., the *pronunciamiento* after the Spanish fashion, a military revolution. It may be a great misfortune for a throne to fall, as in 1830 or 1848, by the faults of kings and of their ministers, but for the army to leave its proper functions, and throw the weight of its arms into the political balance, for it to expel or introduce princes, for it to overturn or set up governments, for it to impose its own will on the citizens by the mere force of bayonets, *this* is more than a misfortune; it is a shame and a humiliation.

This was the kind of revolution which Louis Napoleon attempted at Strasburg; his sole hope was in the army. And yet Mr. Jerrold has not a word of censure for such an enterprise. If he does not openly proclaim, with the Jacobins of '93, that insurrection is a duty, he appears to be much of their way of thinking, since he has no word of reproach for his hero. Louis Napoleon was more severe on himself than is his panegyrist, and his celebrated address at Ham is a *Mea culpa*.

Not blaming the leader of the attempt,

neither does Mr. Jerrold blame that leader's accomplices. He has nothing but praise for Colonel Vaudrey, who, placed by Louis Philippe at the head of an artillery regiment, tried to stir up this regiment against the very man who had entrusted him with the command of it. Still, this was an act of treason, a crime—criminal beyond all others. Let us suppose for a moment that the colonel of one of the Queen's regiments were to try to raise his soldiers against her gracious Majesty, and to cause them to proclaim some pretender, every Englishman on the whole face of the earth would consign the perjured and treacherous colonel to contempt and richly-merited punishment, and Mr. Jerrold would doubtless be the first to do so. How, then, is he able to relate the treason of M. Vaudrey without a word of censure? It seems to me, duty and honour must be the same at Strasburg as at Woolwich.

Mr. Jerrold would in vain argue from the verdict of the jury which pronounced the prince's accomplices not guilty. He has failed to comprehend the feeling which then reigned in the heart of the French people. The acquittal was generally approved, but it is a mistake to suppose that public opinion was favourable to Louis Napoleon and his accomplices. The government had committed a glaring blunder, it had been guilty of a grave fault, in sending Louis Napoleon to the United States in place of giving him up to the courts of justice. Monarchical prejudices, perhaps even more than political motives, had dictated this resolution. Louis Napoleon was a criminal, but he was also a prince, and they wished to pay respect to princely dignity in his person. This, at least, was the view taken of the matter by the French people. But if there is any sentiment deeply rooted in the minds of Frenchmen since '89, it is that of the original equality of all men. The French hold much more to equality than to liberty. The Government of Louis Philippe wounded this feeling in treating as one apart from others the man in whom public opinion, perfectly indifferent to his princely rank, saw only an adventurer and a criminal. It also wounded the feeling of justice which is natural to all men, in demanding that the accomplices should be condemned to death when it had withdrawn the prime offender from the hands of justice. The verdict of the jury, dictated by these feelings, was a severe and well merited lesson to the ministers of Louis Philippe, but it by no means proves that France was favourable to the Imperial cause.

Let us return to the hero of this whole adventure. Mr. Jerrold relates in great detail all the events which marked the morning of October 30, 1836, at Strasburg, and in reading his narrative it is impossible not to be struck with the extremely insignificant part played by the prince himself. Others, as Vaudrey, Fialin (afterwards Persigny), act, command, fail; he lets things take their course, and barely tries to harangue the soldiers who were to be incited to revolt—we know from other sources that he was always deficient in readiness of speech, and that all his addresses were written and read—when the breakdown came he suffered himself to be captured without resistance. The narrative brought to my recollection

what was said to me some years ago, when the Empire was in full vigour, by one of our most distinguished writers, now an influential member of the Liberal party, in the National Assembly:—

"One of the most striking features in the Emperor's character," said my friend, "is that he has the boldness to undertake enterprises and to place himself in serious embarrassments; but once the fray has begun he completely loses his head, knows not what to do, and it is necessary for others to come to his assistance. He had the boldness on December 2 to make a dangerous attempt which was by no means certain to succeed, but once fairly launched in the enterprise he knew not what to do, and would have failed had not Morny been there to take the lead in everything. He had the boldness to cross the Ticino at Magenta in the face of the Austrian army, but when, after the engagement had begun, he was driven back to the river, he lost all presence of mind, and would have lost the battle, and perhaps the crown, if General MacMahon had not extricated him from his difficulties."

At Strasburg things seem to have taken the same course, even according to the narrative of Mr. Jerrold, only there was no one to extricate the Prince from his difficulties, and he allowed himself to be taken without striking a blow.

Unhappily it was just the same in 1870. At that time again Napoleon III. had the boldness to rush into the most hazardous of undertakings. Then he completely lost his head after the first reverses, as terrified France well discerned from the despatches which he sent to Paris. He remained idle and inactive at Metz, giving no orders at all or changing his mind every hour; incapable of deciding either upon a vigorous attack or a prudent retreat; knowing neither how to exercise authority nor how to resign it. Unfortunately no one was present able to extricate him from the difficulty. It would have required a great captain—a Hoche, a Massena, a Kleber: he had Bazaine, Le Boeuf, MacMahon. The Empire perished there, and France still bears in her side the bleeding wound left by her disasters.

ETIENNE COQUEREL.

The Voyages of the Venetian Brothers, Nicolò and Antonio Zeno, to the Northern Seas in the XIVth Century. Translated and Edited, with Notes and an Introduction, by Richard Henry Major, F.S.A., &c. (London: printed for the Hakluyt Society, 1873.)

Découverte de l'Amérique par les Normands au XIème Siècle. Par Gabriel Gravier, Membre de la Société des Antiquaires de Normandie, &c. (Paris, Rouen: 1874.)

The duty of those who undertake the editorship of works selected by the Hakluyt Society for publication is usually limited to the elucidation of a more or less obscure verbal text, but in the present instance that obligation has been superseded by the difficult task of trying to solve one of the most perplexing and remarkable problems within the entire range of geographical literature. The genuineness of the Zeno narrative has long been a mooted question both in the world of letters and of science. If a forgery, it is one of the most extraordinary *tours de force* ever attempted in the age to which it belongs, which was contemporaneous with that of our

Tudor Queens; Nicolò Zeno having published his narrative, as we now have it, in 1558, the year in which Elizabeth came to the throne. At that date, as far as is known, no map existed which gave the general outline of Greenland with anything like the correctness with which it is set down on the Zeno chart; and this fact, we think, constitutes one of the strongest and most incontrovertible proofs in favour of its genuineness. Where, in that age, except from sources such as the Zeno family claimed as their own, could materials have been obtained for giving an accurate delineation of a land, which had actually been lost to human knowledge for more than a century and a half before the publication of the narrative of the Venetian traveller?

After the settlement of Greenland under Erik the Red in the year 983, and the consecration of its first Christian Church under Erik's son Leif in 1000, that most remote and most dreary of northern colonies became for a time the half-way station on the track of the Scandinavian ocean enterprises, which culminated in the tenth century in the discovery by the Northmen of the great Western Continent. By the beginning of the fourteenth century the disturbed political condition of the northern kingdoms, which were all alike torn by intestine wars from within and piratical attacks from without, had, however, led to the almost total neglect of the Greenland Colonies by the mother country; while after the ravages of the Black Death in 1350, when the colonists found themselves too feeble in numbers and strength to resist the assaults of their savage Esquimaux neighbours, Greenland was soon so completely lost to the knowledge of the Scandinavians themselves, that the very position of its settlements was forgotten. The lapse of time seemed only to deepen this obscurity; and when, in 1721, under King Frederick IV. of Denmark, the Danish Government, for the first time after many ages, betought itself of its long-neglected foster-child, and allowed Hans Egede and his devoted wife to carry a knowledge of Christianity to the heathen natives, no authority was extant which could direct the mission, whether the old Danish settlements were to be sought on the eastern or the western shores of that mysterious land in the far North. In the sixteenth century, when Nicolò Zeno gave to the world a narrative and map founded, as he asserted, on manuscripts and drawings traced by the hand of his distinguished ancestor of the fourteenth century, men knew absolutely nothing of the true geography of Greenland.

It has, indeed, been asserted by the Danish hydrographer, Admiral Zahrtmann, who is at once the most determined and the most consistent opponent of the genuineness of the Zeno narrative, that there was in the University Library of Copenhagen an old MS. map in which the Greenland names agree almost uniformly with those set down in the chart of the Venetian geographer. According to him this map was in existence before Nicolò Zeno the younger published his work in 1558, and must have been consulted by him. Now, in regard to the two latter points even Admiral Zahrtmann is un-

able to adduce a shadow of proof. He does not mention the date of this presumed authority, hence we may fairly infer that the chart had no date; and although there is evidence that the Zeno narrative soon after its publication was known to northern geographers, and used by them as a model in the construction of their maps, we have no grounds whatever for assuming that the Venetian writer ever visited the Northern Seas which he had described. Could such a map as Admiral Zahrtmann refers to be proved to have been in existence prior to 1558, and to have been accessible to the younger Zeno, the value of his correct Greenland nomenclature would necessarily be very seriously affected; but in the absence of any such proof the correctness of Zeno's Greenlandic geography is a powerful argument in its favour.

The most curious thing, however, connected with this part of the Zahrtmann charge, is, that no such map exists at present in the University Library of Copenhagen, or has been there within the forty years during which the Chief Librarian, Professor Thorsen, has been in office; yet his appointment in 1833 is contemporaneous with the date of the publication of Admiral Zahrtmann's treatise, although we certainly do not know the year in which that paper was written. For the knowledge of this very singular and interesting fact we are indebted to the indefatigable zeal of the learned editor of the Hakluyt version of the Zeno narrative, Mr. Major, Keeper of the Department of Maps at the British Museum, who, through the influential help of a friend well known to the leading *literati* of Copenhagen, secured the prosecution of a careful search for the phantom map by which the Zeno narrative was to be brought to final judgment. For more than a month of the past year the search was diligently carried on by the officials of the Copenhagen University Library, who at the end of that time were only able to adduce from their labours the negative, yet highly important result to which we have already referred, viz., that no such MS. map was in the Institution or could be discovered to have been there since 1833. Thus the chief element in the Zahrtmann charge, although not definitely disposed of, (since it is of course within the bounds of possibility that the map may have been lost, stolen, or destroyed prior to 1833), is certainly of no importance whatever as long as this map remains undiscovered.

Could all the difficulties and inconsistencies that have been advanced against the Zeno narrative be removed as easily as Admiral Zahrtmann's accusation of plagiarism through the agency of a Copenhagen map, nothing would stand in the way of its universal acceptance as one of the most interesting and important geographical records in existence; but this is certainly not the case. Before we had read Mr. Major's most able, ingenious, and profoundly learned defence of the Zeno narrative, we had never seen any very good reason for believing it to be genuine. Even now, although we confess that our own older doubts have been vanquished by the ingenuity and learning displayed by the distinguished

Editor in his novel line of argument, we feel that there is small chance that the question should ever be brought quite beyond the pale of doubt. Yet this can scarcely be considered to detract from the value of Mr. Major's labours, for while he has knocked down hitherto unassailable difficulties, he has not tried to conceal them or to underrate their strength; but borrowing weapons from his opponents, and using the ignorance and blunders of the younger Nicolò Zeno himself in defence of the genuineness of that writer's narrative, he has opened new and hitherto untrodden lines of defence, and gone straight to the very heart of the question. If, therefore, he fails to convince his readers of the perfect trustworthiness of Nicolò Zeno the younger, the failure is in no way due to any want of skill or zeal on his part, but rather to the utter impossibility of so thoroughly divesting the subject of all inconsistency and contrariety as to deprive men of the privilege—so dear to many of us—of refusing to be convinced by argument or proof of any kind.

To explain the grounds on which the opponents of the Zeno narrative base their doubts of its genuineness, we must give the outlines of the story which it calls upon us to believe. According to the writer, Nicolò Zeno (himself a good geographer, who was born in the year 1515), there were in the Zeno Palace at Venice numerous collections of letters and papers relating to the history of his family. Among these were journals and narratives drawn up by two of his ancestors, Antonio and Nicolò Zeno, who lived in the fourteenth century, and were well known in the history of Venice as adventurous travellers and citizens of note. Some of these valuable papers were unfortunately destroyed by Nicolò Zeno the younger himself about the year 1525, through boyish mischief and from ignorance of their real importance. The letters which on that occasion escaped destruction fell again in later years into the hands of Nicolò, who, then recognising their value, made a diligent search among his ancestral archives for other documents of a similar nature, and rescued from them a sufficient number of papers to compose the narrative which he published in 1558, and to which he appended his copy of an old map, "rotten with age," which had served to illustrate the geography of the countries described in the MS. According to Nicolò's statement, his narrative is simply a compilation of the account written down by Antonio Zeno of his own, and of his still more adventurous brother Nicolò's travels, shipwreck, and strange adventures in the lands, and on the seas of Northern Europe, and in the far West, now known to us as America. Some of the letters were copies of a correspondence between Nicolò and Antonio before the latter joined his brother, and others were direct communications from Antonio to a third brother, Carlo, who subsequently rose to eminence in the Republic. Among many other strange matters, these letters contained a description of Greenland and of the adventures which Nicolò the elder met with during his visit to this land, which he called "Engrenoland," and they afforded evidence of the existence of a remnant of those European

colonies in Greenland, which although they had certainly existed shortly before the time when Nicolò the elder is supposed to have been in the North, were not known to the Venetians of the sixteenth century, when the younger Nicolò drew up his much contested narrative:

A large portion of the history is occupied with the description of the "Frislanda," visited by the Zeni brothers, which is laid down on the map as an island, the south end of which is placed in the latitude of the Ferøe Islands; and this naturally constituted a very grave obstacle to the acceptance of the narrative, till it was shown that under the island "Frislanda" we must comprise the entire group of the Ferøe Islands. This opinion, which was adopted by Admiral Zahrtmann, and advanced as evidence of the ignorance of the younger Zeno and of his fabrication of a name on hearsay merely, is ingeniously used by Mr. Major to clear away the difficulties which had so long perplexed the minds of the *literati* of different countries in Europe. After showing that Columbus and other Southerners, from inaptitude to catch up the right sounds of the Northern tongues, had rendered "Ferøesland," the name under which the group was known, "Frislanda," he follows the route of the Venetian, and identifies under the names of the places which Zeno described the different islands of that Northern Archipelago. It is in regard to the undoubted identification of the Ferøe Isles in the "Frislanda" of Zeno, and of the Shetlands in his "Estland," together with the recognition of Henry Sinclair, Earl of the Orkneys and Lord of Roslyn in the chieftain "Zichmni" of the Zeni brothers, that the editor of the Hakluyt volume of their travels has shown himself at once most indefatigable in research, ingenious in deduction, and successful in demonstration.

Nothing can be more interesting than the comprehensive Introduction with which Mr. Major ushers in the transcript of the original Italian version of the Zeno narrative and his own literal translation of it; and to all interested in the solution of the old Zeno puzzle, we would recommend a careful study of his able Editorial Preface.

We must not, however, leave this volume without drawing attention to the interesting Appendix, which gives the Norwegian original, together with a Latin version and the editor's translation, of Ivar Bardsen's *Description of Greenland in the Fourteenth Century*. Here, even more strikingly than in the case of the Zeno narrative, Mr. Major's learning and acumen have been brought to bear in vindicating the truthfulness and integrity of a much maligned early voyager.

Captain Graah and many other competent northern authorities have long denied the authenticity, or at any rate the correctness, of the sailing directions ascribed to Ivar Bardsen, the some time steward or justiciary to the bishopric of Gardar in the East Bygd of Greenland; and, strangely enough, it has been reserved for our own countryman, Mr. Major, to demonstrate beyond all possibility of question the perfect trustworthiness of the old seaman's report. It had always been regarded as an incontrovertible proof of the spurious character of the Bardsen

sailing directions that they indicated the existence of the "Gunnbjørn Rocks" midway between Greenland and Iceland, whereas no such rocks existed on the track indicated. Mr. Major has, however, shown that in the 1507 edition of Ptolemy there is a most valuable map by Johann Ruysch, which is not only eminently remarkable for being the first chart on which America was laid down, but also because midway between Iceland and Greenland, precisely where Ivar Bardsen had described the position of "Gunnbjørn's Skerries," a large island was marked down, against which stood this inscription, "Insula hæc anno Domini 1456 fuit totaliter combusta." On maps of later date the island and the inscription are, as Mr. Major assures us, replaced by the words "Gombar Scheer," which mark the position of a prolonged line of reef, or shoals. Here then is a marvellously strong evidence in favour of the fourteenth century mariner, whose character for veracity has been impeached for ages by his brother seamen on the ground solely of his description of "Skerries" which do not exist! Truly if every science had many such ingenious searchers after truth as Mr. Major, its special literature would have fewer puzzles with which to harrow and plague its disciples.

Our brief and imperfect notice of Mr. Major's valuable contribution to geographical literature would be incomplete were we to omit to speak of the work by M. Gabriel Gravier, which heads the present article; since its compilation is entirely due to a suggestion emanating from Mr. Major himself, who wrote to M. Gravier, in 1872, for information in regard to the Norman and Breton seamen who could be proved to have seen the American continent before the time of Columbus.

The response to that enquiry has been made by M. Gravier in the form of two interesting and comprehensive treatises, forming the work before us, in which he proceeds *seriatim* to consider all the steps in the many independent tracks of western ocean discovery, which culminated finally in the immortal achievements of Christopher Columbus and his immediate followers. Like Mr. Major's volume, M. Gravier's work is enriched with various maps illustrative of the standpoint of geography at various epochs. With something of German exhaustiveness of matter, enlivened, however, with French gracefulness of style, the author has brought together all that could be nucleated round the subject; and thus the works of these English and French geographers may be said to contribute important aid from two different directions towards one common object. E. C. ORTÉ.

Supernatural Religion: an Inquiry into the Reality of Divine Revelation. In Two Volumes. (London: Longmans & Co., 1874.)

Ditto, Second Edition. 1874.

(Second Notice.)

On the whole, the undeniable cleverness of the First Part is scarcely sufficient to atone for its narrowness of view. The author may hope, if he chooses, by more works of the same kind, to make good his place in a

triad with Mr. Lecky and Mr. Buckle; but in the rest of the work he shows qualities that give him a right to a higher ambition. There, if the significance of facts is not always apprehended, they are always stated candidly—for the most part accurately, unless when the writer's mind is led astray by false theory or by over-study—and in some cases exhaustively, when a department was not too large to be exhausted, and he estimated, adequately or even excessively, its importance in relation to its subject.

And yet even at his best he is unsatisfactory. He has undertaken to prove that the evidence for the New Testament miracles is inadequate, and has (very rightly) pointed out that, whether the Gospel does or does not require miracles to "attest" it, there are some miracles, and those the most stupendous—the Incarnation, Resurrection, and Ascension—that cannot be considered as embarrassing or superfluous attestations, but "themselves are the Gospel." What he succeeds in proving is this—that our four Canonical Gospels had not, until the last quarter of the second century, an exclusive canonical authority. In the course of the proof he strikes out but never follows up several suggestive hints at the probable course of evangelical tradition, and the growth of a New Testament canon out of it; but the difference between what he has proved, what he perhaps could prove if he chose, and what he ought to prove for his purpose, or meant to have proved, seems never to have struck him at all. If Part II. were cut out from its context, and divested of its occasional traces of a controversial purpose, it would deserve, and probably receive, the thanks of men of all parties and opinions, as a piece of honest, laborious work in the accumulation and array of evidence on a question of high interest and importance, which is rarely approached with so little of a foregone conclusion; as it is, it seems one vast *ignoratio elenchæ*. And with all praise to our author's industry, his critical acumen is scarcely proportioned to it. In examining the historical significance of ancient works, of course a critic has to meet the question of their authenticity; and for this the general faculty of common sense and literary tact is scarcely less necessary than verbal accuracy in studying their text—even more necessary than extensive study of commentaries on them. It was hardly worth while to import the fashion of appending to every discussion a long note, composed of references to all sorts of commentators, usually arranged in alphabetical order, from Alford and Baur down to Westcott and Zeller; it was doubtless well to have read them all, if he had not while reading them lost the impression that the one book, which all the others were about, might by itself have made on his own mind. Really, there is no reasonable room for doubt as to the genuineness of the Epistle of Clement: as to those of Ignatius, so far as there is a *consensus* of scholars at all, it tends to the conclusion that the Curetonian recension is genuine; at any rate, it is too much to speak of it as "demonstrated," that Ignatius suffered at Antioch, and that therefore the whole mass of Ignatian literature is spurious.

And this habit of considering books at second-hand leads now and then to misconception or misrepresentation of their drift as well as of their authorship. It is, perhaps, misleading to call Justin's Christianity "strongly tinged with Judaism;" though Justin was more tolerant than most of his orthodox contemporaries, both of Judaism and heathenism, it was Platonic philosophy that had formed his mind, even if the Hebrew Scriptures had entered more largely into the formation of his opinions. But while this phrase might in a certain sense be justified, it is a downright blunder to call Justin "a Jewish Christian:" he was not so in the sense in which Hegesippus was, far less in the same sense as the author of the *Clementines*; and there is not the same presumption, antecedent to textual evidence, for his having used the "Gospel according to the Hebrews," which exists in their case. The textual evidence is, however, tolerably abundant in Justin; and the author is in his element when setting it in array. He has done so, on the whole, fairly, completely, and lucidly. In fact, this view of Justin's evangelical citations and references is, for length and elaboration, the most considerable section of the book; if not new absolutely, his collection of facts will be new to many in England; and, in default of any positive conclusion of the author's as to what Gospels Justin really was acquainted with, and what they were worth, we have here at least a *résumé* of the views of his predecessors on the subject.

But with the Fathers and Evangelists, as with German commentators on them, the author displays the same habit of attending only to books, instead of to the facts they are concerned with. If he has proved afresh, and found it proved before him, that St. Justin was not acquainted with the same four Gospels as Dr. Tischendorf or Dr. Westcott, or at least that they did not fill the same place in his devotional or theological system as in theirs—what then? Our author's view, so far as he has one, seems to be that he used a Gospel or Gospels differing from our three Synoptics to much the same extent as they do from each other: also some form older than that now extant of the *Protevangelium Jacobi*, or at least a closely related work. Very well: the question then is, do these works (as to whose nature and substance we have some evidence) support or refute the antiquity of our Gospels? still more, do they support or refute their character for historical accuracy? But he does not answer nor even ask either of these questions: it is enough that Justin's Gospels were "apocryphal"—and that epithet may, for all that appears in his use of it, cover the conceivable cases of a genuine work of apostolic date, which, from dogmatic or ecclesiastical causes, was not popular with Catholics in the fourth century—of a compilation of post-apostolic date from genuine apostolic sources—and of a post-apostolic forgery with or without genuine materials, but with more or less bad faith, or at least half-conscious falsification, in the use of them. Now if Justin's *ἀπομνημονεύματα* were of the first class—if, as the author seems to think, he follows the Gospel according to the Hebrews, and this was substantially the same form of evangeli-

cal tradition as that recognised by St. James the Lord's brother, and referred to in his canonical epistle—well, if so, the most orthodox or conservative apologist could ask no more: this proves at least as much as if he were found to have quoted our canonical Matthew, at all events unless he had referred it to that Apostle by name.

In fact, it would prove a great deal more: the only thing the orthodox apologist has to dread in this suggestion is, that it is too good to be true. Our first and third Gospels give accounts of the Nativity, between which there are discrepancies which are not underrated by our author. They agree in Mary's conception by the Holy Ghost, her previous betrothal and subsequent marriage to Joseph, and her delivery at Bethlehem; they agree in nothing else whatever. Justin's Gospel, however, if we are justified in speaking of any single work by that title, combined in one narrative some circumstances characteristic of each. Like our Luke, it contained the Nazarene residence of Joseph and Mary, the census of Cyrenius (though either Justin or his authority made a blunder* about his office which our Luke does not make), and the want of lodging-room at Bethlehem; like our Matthew, it had the adoration of the Magi—and this incident seems scarcely separable from the Massacre of the Innocents and Flight into Egypt, which are so difficult to fit in with the independent narrative of our Luke. If this combined story were really older than the separate ones of our Gospels, or at least independent of them, it would be a witness to their accuracy far more valuable than any undoubted citation of them by Clement or Polycarp could have been: it would prove that both Evangelists got hold of facts, or at least stories very early current as facts, which were mutually reconcilable, and could be—or indeed were—combined in a consistent narrative. If this were proved, their historical credit would stand a good deal higher than, by any purely critical standard, it does at present.

The truth is, that Justin's citations, though they scarcely allow and certainly do not point to the view that he used our Matthew and Luke, do point to the view that he used some one who had used them. His account of the Annunciation had, no doubt, a common origin with that of the *Protevangelium*: it is substantially that of our Luke, with an important clause interpolated from our Matthew. Now the verbal variations from Luke are sufficient to prove that Justin did not use our Gospel—perhaps that the extant pseudo-James did not: they are scarcely sufficient to prove that their common source did not. And of course the two former are not likely to have used our Matthew either: but what if the common authority did, engrafting him upon the stock he derived, if not from our Luke, from a common source with him? The phrase given in explanation of the name *Ἰησοῦς*, though spoken to Mary, not to Joseph, is *verbatim et literatim* the same as in our

* The author takes no notice of Zumpt's defence of our Luke's accuracy, but treats his anachronism about Cyrenius as certain. Yet he assumes that Justin's date of the Nativity "under Cyrenius" is meant to coincide with the received one, about B.C. 5.

Matthew: and this coincidence is scarcely likely to be casual, if we take account of the emphatic *αὐτός γὰρ ὠσαί* at the beginning of the clause. It would have been much easier to write *ὠσαί γὰρ*, unless there were a dogmatic object—which will scarcely be ascribed to our Matthew—of referring to the Mosaic origin of the name, and the deliberate incorporation of the Divine Name in it.

Now, if Justin was acquainted, not indeed with our Gospels, but with a compilation from them, or at least a later recension of their materials, intended to reconcile their discrepancies (as in the account of the Nativity, and again in that of the Sayings from the Cross), if he ascribed this work to "the Apostles and their followers," and it was habitually read in the churches he frequented, a real evidence is given, not perhaps to the authenticity of the now canonical books, but at least to their antiquity: they are pushed back to a date that can hardly be very far subsequent to the traditional one.

Admitting, then, that Justin did not habitually use our Gospels, this fact seems insufficient to prove either that they did not exist in his time, or even that their historical authority was not then generally recognised. Moreover, although the attempts must be pronounced failures which have been made from time to time to affiliate almost all Justin's quotations to our Gospels, we really ought to make a good deal of allowance for laxity of citation. Justin was an educated man, and (for an age of persecution) a very honest controversialist; but he was neither a diligent student, in the modern sense, nor a critical theologian. He attached great weight to "the argument from prophecy," and though no Jew himself, was able to extract from a courteous Jewish disputant a compliment for his strict adherence to the text of Scripture; but it is an anachronism to suppose that "the Bible" could have been to him what it is to a modern Christian, not to say a Protestant. A Greek philosopher, such as he claimed to be, still was, as in the days of Socrates, far more of a talker and listener than a reader or writer. In consequence, the spoken word, not the written, would be his standard of truth: such fidelity as is possible in an oral statement would be all that he would expect in a written one, or feel bound to observe in reproducing it. He perhaps would hardly have gone as far as Papias in preference for "the living and abiding voice" to written books,—though, if he did, he would have had Plato on his side,—but he would use books, at any rate, much less than words. It is really a great chance, whether he had ever read and handled a book or books called *Ἀπομνημονεύματα Ἀποστόλων* at all. He was probably a layman; certainly a traveller; certainly also a thorough Catholic, in the primitive and etymological sense of that much-abused word. At his home in Palestine, at Ephesus, at Rome, and wherever else he spent a Sunday, he heard evangelical stories read before the Communion: whether in every church they came out of the same book, he no more cared than he did whether the presiding elder said the same prayer of

consecration two Sundays running. In most churches, the evangelical lectionary would contain accounts of the Incarnation, the Crucifixion, the Sermon on the Mount, and other striking incidents and discourses: if he referred to any of these, the reference would be naturally cast in the form in which he had heard it most frequently and most lately. But he would regard all the books that were read in church, whether more or less familiar to him, as alike embodying apostolic tradition. There may or may not have been important differences between them, in antiquity, authorship, and even fidelity; but the last point he took for granted, and into the two others he never made it his business to enquire. Our author has supplied his omission, but he has done little to disprove his assumption.

W. H. SIMCOX.

The Areopagus and the Ephetae. [Der Areopag und die Epheten.] By Adolf Philippi. (Berlin: Weidmann, 1874.)

Known over the Christian world as "Mars Hill," where St. Paul retorted on the men of Athens, and again familiar to many as the central scene of the *Eumenides*, that great drama for which Aeschylus in old age fanned his poetic fires into a last powerful flame, the Areopagus might be thought to present just such a subject as would command a ready audience for any writer who chose to approach it. But strange to say, the temptation of an appeal to the Christian world does not seem to have had its usual potency, nor can it be said that for the sake of scholars alone very much has been done on this point. The subject seemed to have been exhausted by K. O. Müller's *Eumenides*. But it is no detractor from the wide compass of his learning, nor from the precision of his critical faculty, that here as elsewhere new points of view have brought old facts into combinations not thought of in his time. It had not, for instance, then occurred to anyone, as far as we know, to question the tradition that the drama of Aeschylus was produced as a protest against the measure which Ephialtes, the friend of Pericles, had carried to reduce the powers of the Areopagus. Quite in harmony with the tradition appeared to be the tone of the drama. And yet here was the striking fact in opposition, that those very powers of the Areopagus as a criminal court on which the drama turns were to all appearance left untouched by Ephialtes. It was in no way to the interest of his party to interfere with these powers. His object was to remove the barrier which the Areopagus as a state council used to interpose on the progress of democracy. It has, therefore, since Müller's time become necessary to see whether the play may not have been consistently written in praise of the new measure. Some scholars of eminence are satisfied that it is so, among them being Professor Philippi, the author of a book which, if less easy to read than it might have been by reason of the fact that it deals only with controverted or controvertible points, and assumes a familiarity with all the positively ascertained facts in regard to the Areopagus, has, on the other hand, a freshness and an incisive manner which it is worth some reading

up to enjoy. The reading up may be confined to Schömann's *Antiquitates Juris Publici*, or perhaps better to Westermann in Pauly's *Real-Encyclopädie*, s.v. "Areopagus."

But apart from its importance for the annotation of a Greek play or a chapter of the Acts, the Areopagus is foremost among the subjects which concern those interested in the study of Athenian institutions. As a court of judiciary it arrests attention by the magnitude of the crimes to which its jurisdiction was limited. It was competent to deal only with cases of wilful murder, wounding with intent to kill, fatal poisoning, and incendiarism. Homicide, justifiable or accidental, and manslaughter of certain kinds, were referred to the other courts of the Palladion, Delphinion, Prytaneion, and Phreatys. Having thus to pass judgment only on crimes which demanded a sentence of the utmost rigour, the Areopagites would doubtless have been in an unenviable position had they not been individually hedged about by a high reputation for justice and honour. As it was, after the time of Solon at least, their decisions were referred to as models of justice.

Solon had reorganised the court, appointing as members of it the nine archons on their retirement from office, and provided they could render a satisfactory account of their administration. The new members were therefore men of tried character and mostly advanced in years. From what source the original members had been drawn is a matter of obscurity and dispute: the ranks of proved officials it could scarcely have been, otherwise the reform of Solon would not have been called for. Probably they had been chosen from a social class generally estimable, but liable to exceptional instances of deterioration the more frequent as civilisation advanced. So decided at any rate was the change introduced by Solon, that posterity regarded him as the creator of the Areopagus, and that, too, in spite of the legends which ascribed its origin to beings of celestial nature and to times of more remote antiquity. No doubt, to Solon is due the credit of having organised the Court of Areopagus, the praises of which are familiar in historical times. But before him it seems equally certain there had sat on the barren rocky hill opposite the Acropolis a court appointed to try cases of such a nature as to give birth to the legends in question. Tradition alone might be taken as proof of this, without the positive statement that Solon's predecessor Draco had appointed as judges of the five courts, including the Areopagus, persons styled Ephetae, from which it is to be inferred necessarily that the Court of Areopagus had existed before then, but with a different constitution as regards its members. Solon left these Ephetae as judges in the other four courts, but removed them, apparently by allowing them to die out, from the Areopagus. If in removing them he acted in the spirit of revoking a piece of legislation which in the interval from the time of Draco had been proved inefficient, it would be necessary for us to discover the class and title of the judges who before them again, possibly from time immemorial, had sat in the Areopagus. The Naucrari have been suggested by Wecklein,

but their social position hardly seems to recommend them for functions of this importance, least of all, perhaps, in the eyes of Professor Philippi, who prefers to adopt and to elaborate the theory of K. O. Müller, that down to the time of Solon the Ephetae had always been the judges of that court. The difficulty presented by the statement of Pollux that Draco had appointed the Ephetae to the Areopagus, is met by Professor Philippi with a solution which would be looked upon as too simple and obvious if it were not made very acceptable by an array of facts. He proposes to set it aside as a mistake. For him the Ephetae had always been the judges in the Areopagus till Solon's time. They were men, not of official rank, but of social standing, and probably eligible only in advanced years, as in the Homeric *βουλὴ γερόντων*. He accepts the recent derivation of *Lange's* from *ἐπι* and *ἐρης* = *ἐπ' ἐρης*, or "representative of a clan," obtaining thus a body of men on whom the choice would naturally have fallen in primitive times. On the other hand, the choice may not have been altogether a public one then, when the relations between the court and the temple of the Eumenides at the foot of the hill must have been far more intimate than in a later age. Both court and temple dealt with the same crimes, and there can be little doubt but that the sanctity of the spot for the worship of the Eumenides had originally determined the site of the court. But though this might afford a presumption that the priesthood of the temple had at one time had some voice in the Areopagus, it must yet be said that in historical times precisely the opposite was the case, the Areopagites having this power over the temple that they selected its *ιεροπότοι*.

The Areopagus was, however, besides a criminal court, a state council, with this peculiarity in its action that with certain regular duties to perform it was yet ready at the command of the public assembly to undertake investigations apparently of a very special character. Among its regular functions were those of a sort of police board bringing vagabonds and spendthrifts to justice, protecting the sacred olive trees, seeing that common lands and roads were not encroached on by private persons, and taking care that the standards of weight and measure were not falsified. Its consent, if not absolutely necessary, appears to have been generally obtained for the erection of honorary statues. It looked after public morals and education, and in the introduction of new or foreign religions it was possessed of certain powers apparently not extending to a veto, though perhaps practically so, owing to its great influence. The ultimate decision in such matters was vested in the public assembly. As regards St. Paul, the position of the Areopagus seems to have been that of a council before which a person promulgating a new religion could be brought to make an official explanation. Founding upon this, the Areopagites, if they chose, might lay the matter before the public assembly. When it is said that they also watched over the laws, it seems only to be meant that they could interfere to stop the passage of a measure which was contrary to

existing laws. The occasional duties of the Areopagus to which reference has been made consisted in the preliminary investigation of crimes against the State, upon which the public assembly required special and careful information before deciding. It was a crime against the State, and generally referred to the Areopagites, when a citizen, fearing public calamity, deserted to another State, or removed his goods and family. But, except in the times immediately after the battle of Chaeronea, it is improbable that much of this kind of occupation fell to them. At that time extraordinary powers appear to have been voted by the public assembly, contrary to the usual practice according to which special powers were obtained for each case. So at least it is contended by Professor Philippi, who shows that there is no real evidence of their having any right to initiate of their own accord investigations into crimes affecting the State, unless the crimes had been committed by, or involved members of their own board. Finally, with regard to the book itself, it may be said, that though conspicuous for its number of nice distinctions, it yet maintains not a few arguments widely different in their conclusions from those hitherto accepted. In two instances it deals with important material which, if not actually new, had not previously been considered in all its bearings. We refer first, to the fragmentary inscription so brilliantly restored by Köhler in the *Hermes* (1867), setting forth part of the laws of Draco concerning trial for murder; and secondly, to the accumulation in recent years of inscriptions—mostly, it is true, of a late period—recording the consent of the Areopagus as having been obtained for the erection of honorary statues.

ALEXANDER S. MURRAY.

MISCELLANEOUS LITERATURE.

Words and Places; or, Etymological Illustrations of History, Ethnology, and Geography. By Isaac Taylor. Third Edition, revised and compressed. With Maps. (London: Macmillan.) This well-known book has lately been recast by its author, so as to fit it for the use of students and general readers, as well as for philologists. The special care bestowed on the names of our own country makes it an admirable help in the study of English history. The English race has received contributions from many nations, and our local names would bear witness to the fact, even if our annals were lost: those names too in many cases supplement or correct the annals. A glance at Mr. Taylor's chromolithograph map of "the settlements of the Celts, Saxons, Danes, and Norwegians in the British Isles and Northern France," shows the result of centuries of national contests better than any mere description could do. The proportion of the country conquered by the Saxons from the Celts is visible at once, as is also the curious Saxon colony on the French coast near Calais and Boulogne, where throughout a district of about the size of Middlesex the name of almost every village and hamlet is of the pure Anglo-Saxon type. Similarly, the settlements of the Norsemen show that the various English channels were at one time anything but national boundaries, however great their influence has been in the long run. It is difficult to realise the fact, at first, that the Irish Channel was once a Norwegian channel; when the Norsemen held both the English and Irish coasts, and a Norse king ruled in Dublin. Similarly much mediæval history becomes clear when we see how thoroughly the French Channel

was a Norman one for generations. Mr. Taylor has pursued his enquiry into detail, and by the help of statistical lists of names the chance of error is to a great extent excluded. We could have wished that the incorrect or doubtful etymologies had been even more rigidly excluded. Thus, Marazion, opposite St. Michael's Mount, is still mentioned as Phœnician, though doubtfully; but the name has been proved to be the common Celtic plural form of the word "market." Tenby is put down as "Daneby," while it is the Welsh "Denbigh." Such a note as that on the *Glossa Malperga*, p. 158, had better be omitted. But Mr. Taylor supplies the safeguard against mistakes in his excellent rules for the etymology of places. For instance, such a simple rule as that of ascertaining the earliest mode of spelling a name is often neglected. We lately saw the name of a Cornish manor, Alverton, derived from the Latin *alvus*, the French *vert*, and the Anglo-Saxon *ton*. The spelling in *Domesday*, "Alwardestone," at once shows that it was the dwelling of Alward, one of the many English chiefs who lost their land at the Norman Conquest. The old form of the name Nola in Campania, *Norla*, shows that it merely means "Newtown." Bridgewater and Bridgerule might deceive us if we did not know from the old spelling that Norman chiefs called Walter and Raoul gave them their names. If every study ought to have its "Book of Fallacies," much more should etymology; especially as this science has been made the victim of such wild historical views. Many innocent places have been condemned to bear witness to the Druids; thus at p. 223 Redruth is made equal to Dre-druith, the town of the Druids. In chapter xvii., "the dangers which beset the etymologist" are well described; but, perhaps, the positive rules given in the first part of the work are yet more valuable. But to carry out any rules some knowledge of philology is necessary, and more especially a knowledge of the special laws of each language. A change of consonants which is admissible in one language is not necessarily so in another, and it is by strictly attending to such special laws that philology has made its most recent advance in the hands of Curtius and Corssen. Again, the Teutonic mode of compounding names differs from the Celtic, for the former prefixes the defining term, while the latter usually suffixes it: thus New-ton contrasts with Street-an-Nowan, the word "new" being put first in Teutonic, last in Celtic. So again, the Celts spoke of Strathclyde and Abertay, where the Teutonic forms are Clydesdale and Taymouth. Similarly as between tribes, we find that common Cymric prefixes, such as *tre*, *lan*, *nant*, are rare or non-existent in Gaelic. So again, the Danish settlements in England may be distinguished by suffixes such as *by* and *thorpe*, while *thwaite* is distinctively Norwegian: *thwaite*, meaning a forest clearing, occurs forty-three times in Cumberland, and not once in Lincolnshire; while *thorpe*, the chief Danish testword, which occurs sixty-three times in Lincolnshire, is found only once in Cumberland (p. 105). A book like Mr. Taylor's contains something for every reader; thus chapter xi., "The Street Names of London," almost gives a history of the great city; while chapter xiv., "Physical Changes attested by Local Names," possesses a scientific interest of its own. Many of our names show the changes that have taken place in the characteristic plants and animals of the country. This part would admit of much illustration from the valuable tenth chapter in Mr. Tozer's *Lectures on the Geography of Greece*, recently published. But we must content ourselves here with calling attention to the new edition of this interesting book, which is already largely used for educational purposes; and we trust that Mr. Taylor will have many more opportunities of adding to the permanent value of the work.

C. W. BOASE.

La Sériciculture, le Commerce des Soies et des Graines, et l'Industrie de la Soie au Japon, is the title of a work of considerable interest, which has just been published at Lyons, and which owes

its origin to the Vienna Exhibition of last year. In his opening chapter the author (M. Ernest de Bavier) gives some curious native traditions respecting the origin of *sericulture* in Japan. One of these attributes the creation of the silkworm to a Japanese virgin, who drew it from her eyelashes; another tells us that an infant child of the King of India, being exposed by a cruel step-mother and delivered over to the mercy of the waves, was cast on the shores of Japan and there transformed into a silkworm. Japanese historians give different accounts of the introduction of the industry into the country, but the most widely-received opinion is that it was introduced A.D. 280 by Corean and Chinese immigrants. The reigning Mikado, in 472, ordered the planting of mulberry-trees, and otherwise encouraged the art, which was also practised at his court. The industry developed so rapidly that in some parts it interfered most seriously with the cultivation of rice, &c., and as a famine seemed to be impending, the Government was obliged to take restrictive measures; in certain principalities silk culture was consequently forbidden, and in the Satsuma district the prohibition even extended to the wearing of silk dresses. In the third section of his work, M. de Bavier gives his readers some information about the apparatus which is employed in the Japanese silk districts for spinning and weaving purposes, and which seems to be of a primitive nature. He observes that, notwithstanding the importance of Japan as a silk-producing country, the improvements in spinning machinery were quite unknown there till 1872, when two spinning mills, fitted up on the French plan, were constructed, the larger one at Tomioka and the smaller at Yedo. These, however, only turn out a very small portion of the silk annually produced in Japan, and the simple machinery which has been in use for centuries is still employed for the production of nearly the whole of the raw silk of the country. M. de Bavier further remarks that in the north of Japan he saw apparatus of even a more primitive nature than that of which he gives a detailed description. He was often astonished at the magnificent stuffs produced by the aid of such old-fashioned machines, and which, in his opinion, could only have been produced by the taste, diligence, and persevering industry of the Japanese workmen, who are certainly more skilful than their brethren in the West. Considering the very primitive machinery of which M. de Bavier speaks, it seems strange that the Japanese silks and silk-stuffs, which appeared on the foreign markets after the first opening of the country to intercourse with the outside world, should have been found so fully up to the European mark. We may mention that the silks and silk stuffs exhibited at Vienna were sent almost entirely by the Japanese Government and native merchants, there being only one European exhibitor.

An Elementary Treatise on Steam. By John Perry, B.E., Whitworth Scholar. 18mo, 404 pp. (London: Macmillan & Co., 1874).—This work belongs to Messrs. Macmillan's well-known "School Class-Book" series. It is intended for the use of classes in engineering and other schools, and for the general student. The title affords us but little clue to the contents, for we may speculate as to whether the author discusses steam from a purely chemical or physical point of view as water-gas, or whether he treats of the applications of steam power, or of the history of steam engines. In fact, these things are more or less combined in the little volume. We have in the first of the four books an account of the general effects of heat upon matter: expansion, conduction, and convection, and the connexion between work and heat. The author does not here appear to have sufficiently grasped the idea that heat is motion; he constantly speaks of heat as "entering into" a body, as if it were something material; yet he is evidently well aware that the material theory has long been abandoned. In the following definition, which is an important one, he is clumsy in style,

archaic in mode of expression, and inaccurate in detail:—"Latent heat is the heat which enters into a body without increasing its temperature, being necessary for its condition, or in producing a change in the state of aggregation of its molecules." Is Mr. Perry unacquainted with the "internal work of a mass of matter" of Clausius, and such expressions as "molecular potential energy"? Again, to what does the sentence commencing "or in producing," &c., refer? We must object, too, to the following statement, which, we confess, we cannot understand:—"We see, then, that before oxygen unites with any other body, some energy must be spent in separating the atoms from each other, or they will be unable to make any new arrangement; and this separation is effected by means of an increase in temperature."

The second book treats of "Steam Engines and Boilers," and commences with an early history of the steam engine. We notice the omission of the names of Giovanni Branca and Sir Samuel Moreland, also of Denis Papin, who is sometimes claimed as the inventor of the steam engine. At least, we know that the *Acta Eruditorum* of Leipzig for 1685 contains notices of a new machine for raising water by means of the pressure of steam invented by Papin. Our author passes rapidly from Newcomen's engine to Watt's first improvement of it (dates unfortunately omitted), and then to further improvements. Then he plunges at once into details of construction, and chapters are devoted to the valve, cylinder, condenser, air-pump, piston, connecting rod, fly-wheel, governor, boiler and its appendages. Chapter IX. contains a capital account of parallel motion. Useful chapters on the efficiency of engines conclude the book.

The third book treats of the locomotive, and gives an interesting and fairly complete account of all the details of the machinery, and of the permanent way and points. The fourth division of the work is devoted to marine engines; it contains a noticeably comprehensive chapter on the working of marine engines. An appendix contains various useful tables. Throughout the book a number of useful exercises are given, with the answers to the various questions they contain. Considering the necessary condensation in a work of this size we think the author has managed to introduce a great deal of very useful matter into a small space. The chief defects of the book—want of style, and a not always methodical arrangement of matter—can be remedied in a second edition. Meanwhile we feel assured that the work, even in its present form, will supply a want which has been often felt, and which the larger and more mathematical treatises of Rankine, Bourne, and Clark do not meet.

Moorleichenfunde in Schleswig-Holstein. Von Heinrich Handelmann und Ad. Pansch. (Kiel: Schweser).—The bogs of Ireland and the turf-moors of Northern Germany and Scandinavia have from time to time given back to the world, in a marvellously well-preserved condition, the bodies of dead men and women, who, for aught we know, may have lain for ages entombed in their dark and humid depths. The life-like appearance of these blackened mummies, which often bear unmistakable evidence to the violence to which they have owed their death, has long attracted the attention of scientific men no less than it has excited the wonder and terror of the ignorant and superstitious, and hence every fresh discovery of a moor-buried body is certain to arouse strong local curiosity and interest. The question of the chemical agency by which certain parts of the animal frame are preserved, whilst metallic substances and textile fabrics exposed to similar agencies are in some cases wholly destroyed or greatly modified in consistency and texture, is deserving of careful attention, and any attempt to throw new light upon the subject is acceptable to the archaeologist no less than to the chemist, since no trustworthy test has as yet been suggested for determining the length of

time required to produce the effects perceptible in bog-preserved bodies. On this account good service to science has been rendered by Dr. Heinrich Handelmann and A. Pansch in this *brochure*, in which they have given us a minute report of the appearance, state of preservation, position, and place of discovery of several bodies which have in the course of the last three years been brought to light from different Schleswig and Holstein moors. In most cases these bodies were found to be wrapped in hides or skins to which the hair or wool was still attached. In a few instances, the coverings were of woven woollen texture, like tartan plaids, fringed all round and exhibiting traces of stripes or squares. Roman coins belonging to the time of Septimius Severus (194 A.D.) were found near one of the bodies discovered in the South-Brarup moor, together with stamped and otherwise ornamented leather shoes, beads, iron weapons, and many other objects; while at Corselitze (Falster) a bronze fibula and seven glass beads were recovered. Dr. Handelmann found that in all cases where the bodies were submitted to his notice before they had been too long exposed to the action of the air, they were thoroughly saturated and infiltrated by the bog-liquids, and were of a blackish brown colour. The skin and the hair had been the best preserved, the former being thoroughly tanned, while the latter retained even a flaxen or reddish colour. The bones had been outwardly preserved, but they had become discoloured and soft throughout, had lost weight, and could be cut through like the softest wood. The cranial bones were generally the most changed, being friable and easily crumbled to dust. At first sight the bodies seemed to have preserved muscle as well as bones and skin, but this was rather apparent than real, for on removing the skin the muscular substance was found to have almost wholly disappeared, leaving only the tendons stretched out as a kind of framework. Thus the sternal cavity was usually empty, while the viscera were so nearly destroyed that the liver was generally shrunk into a small shrivelled mass of tissue, and the spleen scarcely recognisable.

The authors are of opinion that some bogs exert a far more strongly marked preservative action on the human body than others. If this hypothesis should be found correct, it will place another impediment in the way of determining chemically the age of moor deposits, a question which it seems impossible in the present day to decide upon any but the still very uncertain grounds of palaeontological and archaeological speculations on the assumed age of the animal bones, industrial products, and other remains found buried with, or near the bodies.

EDITOR.

NOTES AND NEWS.

Macmillan for October will contain Professor Huxley's Birmingham address on Priestley, with considerable additions. Also a sketch of Lady Duff Gordon's life by her daughter.

THE Rev. Dr. Redmond, of Chudleigh, points out an inaccuracy in our last note on the late Father Theiner (ACADEMY, p. 292). Theiner was not a member of the same order as Gratry. The Oratory founded by St. Philip Neri, and called after him, has no connexion with the French Oratory founded by Cardinal de Berulle. Theiner belonged to the former, Gratry to the latter congregation. The English Oratorians are an offshoot from the Italian, not from the French institution.

THE following are among the most noteworthy of recent additions to the manuscripts in the British Museum:—

The autograph will, dated May 27, 1766, of Jean-Jacques Rousseau, and a series of letters of Rousseau, David Hume, R. Davenport, L. Dutens and others, connected with the residence of Rousseau in England, and his quarrel with Hume. Letter-book of Silvester Jenks, of Albrington, co.

Salop, partly relating to proceedings of the English Catholic Chapter, 1703-1707. A parchment roll, being the Receiver's Account of the Duchess of Buckingham, 1474. Letters of Henry VIII. to Sir Nicholas Carewe, Ambassador at Vienna (1530), and other State papers to 1734. Some original letters of Camden, J. Donne, Lady Raleigh, &c.

WE understand that Mr. E. Dowden, Professor of English Literature at the University of Dublin, is preparing for publication a series of lectures which he has delivered at that Institution on "The Mind and Art of Shakspeare." The work will be published by Messrs. Henry S. King & Co.

A WORK will shortly be issued by Messrs. Henry S. King & Co., from the pen of Mr. H. Curwen, in which the main idea has been to select the most typical examples of *Literary Strugglers* in the chief countries of the world. The writers treated of are:—Novalis, as representing Germany; Henri Murger and André Chénier, France; Edgar Allan Poe, America; Alexander Petöfi, Hungary; Chatterton, England; and Tannahill, Scotland.

MESSRS. WILLIAMS and NORGATE are about to publish *Lost and Hostile Gospels*, by the Rev. S. Baring-Gould, containing an account of the Toldoth Jescher, two Hebrew Gospels circulating among the Jews in the Middle Ages; with a critical investigation of the notices of Christ in the Talmud, as well as in Josephus and Justus of Tiberias. To this is added an investigation into the extant fragments of Gospels circulating in the first three centuries, which the author believes to have been drawn up either under Petrine or Pauline influence, whilst the canonical Gospels sprung from a Johannite party of conciliation.

THE same author has in the press *Yorkshire Oddities and Strange Events* (Hodges), the materials of which were collected during a residence of many years in the county.

THE *Times* on behalf of Mr. Wilberforce asks all those who have any letters written by his father, the late Bishop of Winchester, which in their opinion would be useful to a biographer, to be kind enough to send them to Canon Ashwell, Canon Lane, Chichester.

MESSRS. GEORGE BELL AND SONS having been applied to by some leading members of the New Shakspeare Society to issue, at a moderate price, one of their post 8vo editions of Shakspeare in a readable type that will not destroy the eyes, like the mischievous double-columned editions so popular of late, have determined to re-issue their handsome Singer's edition of 1856, with notes, and probably a supplementary volume of the "Critical Essays on the Plays," by the late William Watkiss Lloyd. The work will be from Whittingham's type, in nine volumes—or, with Lloyd's Essays, ten—at half-a-crown apiece, and will be a boon to readers of Shakspeare.

FELLOWS of scientific societies will be interested to hear that Messrs. Henry S. King & Co. will shortly publish, under the title of *Scientific London*, a volume of memoirs of the most prominent scientific institutions in the metropolis, including the Royal Society, the Royal Institution, the Society of Arts, the Institution of Civil Engineers, the Statistical, the Royal Geographical, and other Societies. In collecting and arranging his material, the author has received invaluable aid from the secretaries of the learned bodies specified, who have spared no pains to ensure the absolute accuracy of his statements. The volume is from the pen of Mr. Bernard H. Becker, a well-known contributor to scientific journals.

WE are compelled to defer a full report of Brugsch Bey's lecture before the Oriental Congress, on "The site of the lake, or sea, passed by the Israelites at the Exodus;" but the substance of it may be read in the ACADEMY of May 2, 1874.

SIR WALTER ELLIOT, K.C.S.I., the President of the Turanian section, has also handed to us the manuscript of the address which he had prepared, but did not read, in order to allow more time for the work of the section.

THE Hunterian Club, of Glasgow, have just sent out the four concluding parts of their issue for the season 1872-3, namely: No. XVII. Sir Thomas Overburies Vision, by Richard Niccols, reprinted from the first edition, 1616 (of which there is no copy in the British Museum), with a very interesting Introduction by Mr. James Maidment, tracking the rise of the young Ker to the Earldom of Somerset, his profligate wife's poisoning of Overbury, and her getting him smothered in the Tower; also the descent of the present Duke of Bedford from her daughter. This volume is presented by Mr. Alexander Young. No. XIX. Martin Mark-All, Beadle of Bridewell; His Defence and Answer to the Belman of London. Discovering the long-concealed Original and Regiment of Rogues, when they first began to take head, and how they have succeeded one the other successively unto the sixe and twentieth yeare of King Henry the eight, gathered out of the Chronicle of Crackeropes, and (as they terme it) the Legend of Lossels. By S. R. 1610. No. XX. The Letting of Iymovrs Blood in the Head-Vaine. With a new Morisco, vpon the bottome of Diogenes Tubbe. 1600. No. XXI. A Terrible Battell betweene the two consumers of the whole World: Time and Death. By Samuell Rowlands (by whom also are Nos. XIX. and XX.). The Club books are handsome quartos on ribbed paper, with copies of the original woodcuts. For the present season, 1873-4, the committee hope to issue nearly all the rest of Rowlands's works, with a large instalment of the Bannatyne Manuscript; and Mr. Thomas Russell, of Glasgow, will present the members with a volume of Patrick Hannay's Poetical Works. The Club needs some thirty members to complete its limit of two hundred. Application for membership should be made to the honorary secretary, Mr. Alexander Smith, Laurelbank Place, Shawlands, Glasgow.

THE work by Léon Walras, Professor of Political Economy at Lausanne, of which we made an announcement some months ago, has been published. It is entitled *Éléments d'Economie Politique*, and will much interest such economists as are also expert mathematicians—rather a limited section of the economic world, we think. But the work may be found interesting to mathematicians who make no claim to be considered economists; and, in England at least, it is likely to find more mathematical than economic readers.

WE have already alluded (ACADEMY, June 13) to the Insect Exhibition held, not, as stated, in the Palais de l'Industrie, but in the Orangerie in the Tuileries gardens. It was opened on Sunday, the 6th, by a *déjeuner*, and all due formalities, by M. Dugué, the President of the Agricultural Society, in presence of the Minister of Commerce and Agriculture. There is little to add respecting it beyond the programme already given. A ticket is affixed to each insect, stating its habits, its uses, or the mischief it commits. The Phylloxera of the vines is, of course, a prominent object of interest; and in addition to the insects, in an "annexe," we have the insect-eating birds, each with a card round its neck, giving its habits, uses, appetites, &c. The cultivation of the edible snail, of leeches, and crayfish, form a supplementary division.

THE Russian Government is about to publish at Tiflis a collection of materials for the history of the war of the Caucasus and Trans-Caucasus, and of the Russian domination in that district. An official notification, dated August 25, the fifteenth anniversary of the capture of Schamyl by the troops of Prince Bariatsky, asks for the loan of any documents relating to the war in the hands of those who took part in the struggle or of their representatives.

PROFESSOR ZUPITZA has resolved to re-edit Aelfric's Anglo-Saxon Grammar. He will probably publish it for the Vienna Academy.

A MANUSCRIPT by Francis Thynn, the herald, and the author of the well-known *Animadversions* on Speght's first edition of Chaucer's works, has been lately added to his collection at Longleat by the Marquis of Bath. It is a small quarto, entitled, "Miscellanea, conteyning matters concerning the Treasures of England or of the Exchequer in coyne and many other things belonging to the Exchequer. Collected and warranted oute [of] and by aunciente Records and approved Histories, by Francis Thynn, 1599."

In his edition of the various versions of the old romance of Guy of Warwick, for the Early English Text Society, Professor Zupitza of Vienna intends to publish first the paper manuscript in the Cambridge University Library, though it is probably the latest, say 1450 A.D., because it is complete. His second text will be the oldest fragment of the romance, that in the vellum Auchinleck MS. of about 1320 A.D.; and this will probably have beside it, in parallel columns, those parts of the vellum Caius manuscript (of perhaps about 1430-40 A.D.), which belong to the same version, though they have been much corrupted. The very late independent version by John Lane in the Harleian MS. 5243, will be issued afterwards as a separate publication, as its linguistic value is but small.

PROFESSOR PAUL MEYER has in the press the second part of his *Recueil d'Anciens Textes Bas-latins, Provençaux et Français*, and will give in it all the versions of the Chansons de Roland. M. Meyer approves of the English method of printing parallel texts, or all the texts of old poems, and leaving them to tell their own story. He denounces the German way of treating the Niebelungen Lied, for instance, of which Lachmann declares that MS. A best represents the original, which he accordingly rewrites according to his own fancy; Professor Hofrath Bartsch declares that MS. B is the best, and therefore rewrites that on his own theory; and lastly, Professor Holtzmann asserts that MS. C is the true representative of the original, and he rewrites that. The three doctors agree in only one point—that the Poem *must* be rewritten by a modern German Professor, to be properly appreciated. (It need hardly be said that the Germans themselves quiz this proceeding.) M. Meyer will also complete shortly his work on the old French *Chansons de Geste*, which has been five years in the press; and he will continue his Reports on Old French MSS. in England. He has lately found some very rare ones in Pembroke College, Cambridge.

JUST now, while it seems to be in fashion to revive the history of some of the decaying squares of the metropolis, it may be interesting to draw attention to a legend connected with one of them, which is little, if at all, known to the curious in such matters. The friends of Oliver Cromwell are said to have secured his remains after exposure at Tyburn, and to have buried them in a meadow to the north of Holborn. The precise spot has been declared by some to be at this time the centre of Red Lion Square, and the obelisk (which has now disappeared, or is covered by a sort of summer-house) was thought to be a memorial erected to him by an apothecary who was attached to Cromwell's principles, and had so much influence in the building of the square as to manage the marking out of the ground; thus further contriving to pay this tribute to his favourite. This story is told in *Anecdotes and Biography*, by L. T. Rede, a second edition of which appeared in 1799—a work, perhaps, of not much authority. Curiously enough, however, it has been discovered that an apothecary named Ebenezer Heathcote, who married the daughter of one of Ireton's sub-commissaries, was living at the King's Gate, Holborn, soon after the Restoration. Cunningham makes no allusion to this tra-

dilion, but gives authority for saying that the bodies of Cromwell, Ireton, and Bradshaw were carried from Westminster Abbey to the Red Lion Inn in Holborn, at that time the largest and best frequented in that thoroughfare; from thence they were dragged on sledges to Tyburn.

Leigh Hunt has left a curious reminiscence of an "old lady of quality," who lived in this square, "a quarter in different estimation from what it is now." She astounded him one day by letting her false teeth slip, and clapping them in again. It was at her house, he adds, that his father one evening met John Wilkes. Not knowing him by sight, and happening to fall into conversation with him, while the latter sat looking down, he said something in Wilkes's disparagement; on which the jovial demagogue looked up in his face, and burst out laughing. Jonas Hanway lived and died in a house in this square, the principal rooms of which he filled with paintings and emblematical devices in a style peculiar to himself, as his biographer expresses it.

THE first of the Early English Text Society's publications for this year, in its Extra Series, is Part I. of Mr. Furnivall's edition of the rhymed *History of the Holy Grail*, by Lancelot, a skinner of the time of Henry VI. The Cambridge (Corpus) MS. containing it being unique and having lost its beginning, the first hundred pages of this volume are occupied by a print of the corresponding part of the prose French original of Walter Map (not of Robert de Boron, as stated in the Society's report *), from a British Museum MS., with occasional readings of another; it is a tolerably pure, though not early specimen of the Picard dialect, and was given in full with the English poem in the *Scynt Graal*, edited twelve years ago by Mr. Furnivall for the Roxburghe Club. Lancelot's verse, of which the part now published is an account of the fabled adventures of Joseph of Arimathea and his party on their way with the sacred dish from Palestine to England, is important and interesting as the only full English version of the romance as expanded by Map, and as a monument of the language of the fifteenth century; but its careless rhymes, very rough metre, and abundance of rhyme-padding, of no use for either metre or meaning, make it much less poetical than the old French prose, which has a freedom and simplicity foreign to the modern tongue, and pleasing in their quaintness. A review of the book must be deferred till the appearance of the remainder, with the editor's introduction and notes; in the meantime we would refer those who wish to have the latest results of a competent scholar's researches on the strange development of this remarkable and important Arthurian legend, to the first of M. Paulin Paris's Essays on the Romances of the Round Table, *Le Saint Graal*, in vol. i. of the *Romania*, pp. 457-482 (No. 4, Paris, October 1872). An earlier English poem from the same original was edited by Mr. Skeat for the same Society in 1871, under the title of *Joseph of Arimathea*, and should be compared with the present version; Mr. Skeat's excellent introduction requires, however, to be altered in several points to make it harmonise with the facts brought out by M. Paris's more recent investigation.

THE soul of Francis Rabelais, writes Hazlitt in one of his most amusing essays in *The Round Table*, passed into Thomas Amory, the author of the *Life and Adventures of John Bunce*.

"Both were physicians, and enemies of too much gravity. Their great business was to enjoy life. Rabelais indulges his spirit of sensuality in wine, in dried neat's tongues, in Bologna sausages, in botargos. John Bunce shows the same symptoms of inordinate satisfaction in tea and bread and butter. While

Rabelais roared with Friar John and the Monks, John Bunce gossiped with the ladies; and with equal and uncontrolled gaiety."

The work which Hazlitt, after this introduction, proceeds to analyse, has long since passed into oblivion; together with another by the same writer, called *Memoirs of Several Ladies of Great Britain*, though styled, by a critic in the *Retrospective Review*, two of the most extraordinary productions of British intellect. A long and curious account of Amory is to be found in *Chalmers' Bibliographical Dictionary*; but what has served to bring back our recollection of him is the sight of an autograph letter recently added to the collections in the British Museum, written by him to Francis Blackburne, Archdeacon of Cleveland. The latter published anonymously, in 1766, a work entitled *The Confessional*, which raised a great stir in polemical circles, and ran through several editions; and, as appears from an endorsement on the letter in question, Blackburne was anxious to get from Amory an independent judgment upon it. Amory's reply is much too long and too tinged with his peculiar theological views to be given entire, but some portions of an autobiographical nature are curious enough to deserve printing. It is dated July 29, 1769, from Wakefield, where Robert Amory, his son, practised as a physician. We give here a few extracts:—

"It is forty years since I supped with you at Mr. Wilson's Lodgings, & more from our first acquaintance; for, I think I talked with you on the walls of York in 1728. I do not remember to be sure the name of the Gentleman, but it was a young clergyman; however y^e year after, on my coming again to York, most certainly I was several times in y^e company. It could not be after, because I went away that year, and returned no more. . . . forty year then I say it is since that time, & as I went the next day after the night we last supped together towards Chester for Ireland, which I travelled all over; then to France & Spain; & from Cadiz in Andalusia sailed into the Main; crossed the Line y^e 22^d December '36, & proceeded through a vast variety of difficulties, perils, & dangers, to many places on the south side of the Globe;—could I have a thought, that after all, & such a length of time, I should ever see you again; as I had no notion of your position, nor any intention to be in Yorkshire, if I did live to grow old? But so it has come to pass. Heaven protected me, & providence brought me here at last; pretty well at 72, though 40 years ago, by falling down a precipice on Blackstone edge, I was carried into this town as an Xpiring man; several bones broken, & bruised all over in a miserable manner. What Numbers of the young, the fair, the wise, the good, have I seen fall on either hand of me to rise no more—& I, up still! And as you are the only one living who knew me almost half a century past, a friendship naturally sprouts from so good a ground, I hope to see you soon, for I design for Richmond, & in the mean time, shall be glad to hear from you. Your Letters will be always pleasing to me.

"As to the Author of the Confessional, I have not heard for certain who he is: but as it is a fine book, I greatly esteem y^e writer, & think if it was generally read with attention, & rightly understood, it would be of eminent use to Christians; by making them such upon a rational & wise choice, & by ruining faction in religion.

"It is astonishing, but very true what I am going to say, that in a conversation I had with the Royal Daughter of Jett, the young black Queen of Borneo, I heard more sense from her lips, relative to Religion, than I ever did from the greatest Divines in Europe, the choice few excepted. The subjects of this Monarch are Mahometans, but their Prince was a *pure theist*, & looked upon the Koran as a *Piece of Policy*—so far very useful. She had the most beautiful notions of Deity and Morality, from the light of Nature. Her Understanding was as charming as her features & figure.

"But I detain you too long. *A Dio.*"

THERE are two or three interesting minor matters recorded in Mr. Allan J. Crosby's *Calendar of State Papers, Foreign, 1569-1671*, published this week, which may be allowed to receive

notice from us before the graver historical materials, with which the volume is chiefly filled, are reviewed. Among the names incidentally occurring in these papers is that of John Stow, "a collector of chronicles," who figures in an examination taken before the Lord Mayor "of such as knew the Spanish Ambassador's writings." These "writings," it seems, were being circulated about the City in justification of Alva's embargo on the English merchant ships. We meet, too, with Daniel Rogers, whose manuscript volume of Latin poetical compositions we recently noticed as being in the possession of the Marquis of Hertford; he is here described by Sir Henry Norris as steward of his house, and instructor of his children, a man very well learned in the Greek and Latin, whose father was burnt for the religion. There are, also, two affecting letters from the philosopher Peter Ramus or De la Ramée, to the Cardinal of Lorraine, in which he reminds him of their friendships five and thirty years before, and prays that he will not deprive him of his professorship and all other rewards and fruits of his former studies; he also defends himself from the charge of hastily changing his religion. In spite of this appeal Ramus is shortly afterwards served with a notice to quit the College of Presles, and on the same day (October 8, 1570) a proclamation is issued by Charles IX., forbidding any of the reformed religion from holding office or teaching in the University of Paris. Ramus returned to Paris in the following year, and was one of the victims in the massacre of St. Bartholomew. Sir Henry Norris writes from Paris to Cecil in August, 1569, that Robert Etienne, the King's printer, who for his religion is forced to abandon his country, has required him to present to Queen Elizabeth the fruit of his last labour (a copy of the Scriptures), as a token of the service he owes to her as the chief patroness of the Gospel. Bound up with the Scottish correspondence, examined by Mr. Crosby for the purposes of this *Calendar*, we learn there is a curious collection of black-letter ballads, printed at Edinburgh by Robert Lekpreuik; they are of a political character, and extremely quaint in their metre, language, and ideas. There is also another most indecent ballad in manuscript, ridiculing John Knox and the reformed party, the endorsement of which—"a lewd ballet"—aptly describes its contents.

THE second part of vol. xiv. of the *Numismatic Chronicle* opens with an article by the Rev. Prof. Churchill Babington, a list of some unpublished or little-known coins of the Romans relating to Britain; a branch of numismatics, which, as the Professor observes, is in need of more attention than it at present receives. The next paper, by Mr. C. F. Keary, of the British Museum, is a well-directed attack upon a theory proposed by Mr. Rashleigh with regard to coins bearing the name of Ethelred (or Ethilred) which have generally been attributed *en bloc* to the second of the kings of Northumbria of that name, but which Mr. Rashleigh distributes between the first and the second Ethelred by a principle of discrimination which, as Mr. Keary abundantly shows, is open to the gravest objections. Mr. Henfrey contributes three papers. The first is an interesting account of the collection of coins belonging to King Charles I., who inherited them from his brother Prince Henry. After going through various vicissitudes the collection, which was supposed by Joseph Scaliger to contain 30,000 pieces at the time when Prince Henry purchased them of Gorlaeus, finally perished in the fire which consumed Whitehall in 1697-8. Mr. Henfrey's second article is on a half-crown die of Charles I., and the subject of his third is the connexion of T. Simon the medallist with Guernsey, a paper which will prove interesting to numismatic biographers. A curious notice is contributed by Captain E. Hoare, on a document relating to the copper coinage of 1672-3, being the account and balance-sheet (for nine months of 1672-3) of James Hoare, comptroller and subsequently warden of

* The MS., about 1320 A.D., states that its version is by Robert de Boron; but M. Paulin Paris contends that this is a mistake. The authorship is very doubtful.

the Mint. This James Hoare is not only to be noted on account of his connexion with the Mint, in which he was Surveyor of the Meltings and Clerk of the Irons as early as 1641, but is also deserving of renown as the founder of Hoare's bank, about the year 1640. He is mentioned (Capt. Hoare remarks) in the *London Directory* for 1677 as "James Hore, at the sign of the Golden Bottle, in Cheapside," one of the "goldsmiths who keep running cashes." The "Golden Bottle" is now over the door of the bank in Fleet Street, having been removed thither a little before the year 1700. The sixth instalment of Mr. Cochran Patrick's "Notes on the Annals of the Scottish Coinage" is the last paper. It deals with the records of the coinages of James VI., and forms an interesting part of what will be, when completed, a very important work. The number concludes with notices of books, &c., and with an account of Snelling's Plates, by Mr. Henfrey, and a note on the forthcoming edition of Marsden's *Numismata Orientalia*.

M. FUSTEL DE COULANGES continues in a recent number of the *Revue des Deux Mondes* his researches into the Origines du Régime Féodal, begun in the *Revue* of May 15, 1873. The present article is chiefly remarkable for referring the foundation of the feudal system almost exclusively to voluntary "commendation," the result of the natural desire of the weak to seek the protection of the strong. As this feeling is universal (though not, perhaps, more so than the contrary desire of the strong to oppress the weak) M. de Coulanges consistently maintains that the system is no more German in origin than Gallic or Roman, but was developed by the several nations of Europe independently, but from the action of the same causes. However this may be, his history of the institution of patronage in Gaul from the time of Caesar to that of the Carolingian kings, is eminently interesting and suggestive, and the whole article deserves careful perusal.

M. GEFFROY's article on Amédée Thierry in the same number of the *Revue* does full justice to its subject. Though throughout an *éloge*, it is moderate in tone, and the criticism of the deceased historian's work is as able as it is sympathetic. With the objections urged against the ethnological theories of the *Histoire des Gaules*, the writer does not altogether agree, though he admits that this, Thierry's first important work, is now to a certain extent "dépassé." He is on firmer ground when he comes to the author's later writings, especially those which have to do with the fourth and fifth centuries, Thierry's "vrai domaine" as an historian. The extent and value of his researches in this period of history, hitherto (Gibbon and Tillemont notwithstanding) almost a *terra incognita*, are shown by M. Geffroy with admirable clearness and force. Premising that the three dominant facts of the epoch were the triumph of Christianity, the decadence of the Empire, and the invasions of the barbarians, he claims for Thierry the credit of having been the first, in his *Lives of St. Jerome and St. Chrysostom*, his *Récits et Nouveaux Récits de l'Histoire Romaine*, and his *Vie d'Attila et de ses Successeurs*, to analyse fully these several phenomena in all their complex causes and effects. In his interesting *résumé* of the above works, M. Geffroy inclines to regard the *Nouveaux Récits* as exhibiting most conspicuously the author's talent and art in vivid grouping of details; while his final estimate of Thierry as a writer assigns to him a high place among the "historiens des origines de la société moderne" by the side of Guizot and his own brother, Augustin.

NOTES OF TRAVEL.

FROM the Egyptian correspondent of the *Journal des Débats* we learn that Europe is threatened with the visitation of a terrible scourge, forgotten for centuries past. This is none other than the black death, which depopulated Florence in olden

times, and which Boccaccio rendered famous in his *Decameron*. The pestilence is spreading rapidly in the neighbourhood of Medina and Mecca, its chief feature, the dreaded plague spot, which, once it appears, is almost universally fatal. The Egyptian Government is exerting itself to the utmost to prevent the spread of the contagion; but unfortunately the Ramadan is at hand, when thousands of Mussulman pilgrims flock to the shrine at Mecca, and it is feared they will not only help to spread the contagion there, but also bring it back with them to Europe. The greatest anxiety is felt in Italy, on account of its frequent intercourse with Egypt and the coasts of Asia Minor. The only means of averting the danger would be a stringent prohibition to the pilgrims to return direct to the countries from which they came; but this measure would require the united action of the European governments, in order to gain the consent of the various Mussulman governments.

THE U.S. man-of-war *Ashuelot* has been cruising for about a month in the waters of the Upper Yangtze, and the results of this expedition appear to be in every way satisfactory. From the *North China Herald* we learn that the *Ashuelot* went "up the river for a distance of over 1,000 miles, or more than 360 miles above Hankow, and considerably above the point hitherto reached by foreign vessels." During the *Ashuelot*'s stay at I-chang, courtesies were exchanged between the officers and the Chinese officials, and "a party from the ship went overland on an exploring expedition, and met with the greatest kindness and good feeling everywhere." The vessel then steamed up as far as the first Gorge, fifteen miles above I-chang, after passing which point the navigation, we believe, becomes difficult, owing to the occurrence of dangerous rapids. On several occasions during her voyage, great curiosity was displayed by the natives at the sight of the *Ashuelot*. "At one time the assemblage on the banks was computed at 50,000 to 60,000, immense numbers having repaired to I-chang from the districts round to see the extraordinary visitor." Commander Matthews reports that he everywhere found sufficient water to float the largest class of merchant vessels, and also that "portions of the country above Hankow were very much inundated." This, however, is commonly the case during the summer months.

It is stated that the Government of Sarawak intends to found another settlement, 150 miles up the Rejang, which is navigable to that distance by small vessels. There are already two settlements on this river, distant 100 and 60 miles respectively from its mouth. The trade on the river has increased considerably during the past few years; the principal articles of export are gutta-percha, camphor, and bezoar stones, which are said to be sold at their weight in gold. The Rejang is the principal river on the northern coast of Borneo, and is some 70 miles distant from Kuching, the capital of Sarawak. As steamers have now begun to frequent this part of the territory, it is hoped that its trade will soon be more fully developed.

EARTHQUAKES are beginning to be reported from Germany, and recently the village of Wurm, near Herzogenrath, has been disturbed by sharp shocks.

THE eruptions of Mount Etna continue, and, although at present there seems no real cause for apprehension of danger to life, the villagers of Randazzo and Linguagrossa have left their homes and fled to the lower settlements.

ACCORDING to the *Levant Herald*, the Circassian settlers at Tchoru, Tchataldja, and Silivria appear to be giving a great deal of trouble and annoyance to the peaceable population among whom they are quartered. A temporary respite from the aggressiveness of the settlers was afforded to them a short while ago, when the Circassians quarrelled and came to blows with one another; but, their internal differences having been settled by the authorities, by the imprisonment of the chief agitators,

the Circassians have returned with redoubled energy to their national diversion of stealing horses. Besides which, probably with a desire to extend the scope of their occupations, they have begun to show themselves in armed bands on the most frequented roads, where they plunder travellers after a fashion that might excite the envy of an Arvanitaki.

THE *Finanza* of Alexandria reports a remarkable journey on foot, undertaken recently by an Italian of the name of Ricci, who has walked from Constantinople (after crossing the Bosphorus) across Asia Minor, and along the coasts of Syria and Palestine to Alexandria; the whole journey occupying 158 days.

THE third *Zeitschrift* of the Berlin Geographical Society opens with a series of letters from Dr. A. Buchholz, who started in July 1872, in company with Drs. E. Reichenow and W. Lühder to the Cameroon river in West Africa. He had previously been attached as scientific member to the Koldey Polar expedition on its voyage along the eastern coast of Greenland, and after the shipwreck of the *Itana* was one of the party which drifted southwards on the ice floe. Since Dr. Buchholz's arrival in Africa, Dr. Lühder has unfortunately succumbed to the influence of the climate, and Dr. Reichenow has returned home. Dr. Buchholz has thus been left to conduct his researches single-handed and has transmitted several valuable collections to the Berlin Museum. Next finds place a short monograph, by Professor Sadebeck, on the Meissner mountain, near Cassel, the height of which has been lately fixed by triangulation and found to be 2,462 feet. A translation of Mr. Clements Markham's paper, read before the Royal Geographical Society, on the railway from Mollendo to Lake Titicaca, in Peru, follows next, with a sketch map showing the astonishingly steep gradient of this great engineering feat; and the number concludes with a short communication from the African traveller Dr. Nachtigal, dated Abeshr, July 31, 1873, which affords some information respecting the Wadar country, and gives a somewhat alarming picture of the Doctor's exchequer, which was so reduced as to necessitate a speedy return.

A GERMAN translation of Paul Hunfalvy's *Travels in the Eastern Provinces of Russia* has just been published at Leipzig by the firm of Duncker and Humblot, which is also bringing out a German version of the *History of Finland from the earliest Ages to the present Time*, by Professor Yrjö Koskinen. Herr Hunfalvy's work is especially valuable with regard to the study of the affinities between Hungarian and the dialects spoken in the territories of the Old Slaves of Livonia, Esthonia, and other parts of the coast-lands of the Baltic and the Gulf of Finland. The author's observations on the habits, speech, national characteristics and literature of these people are especially important at the present time, when philologists are directing their attention so successfully to the elucidation of the origin and ramifications of the ancient Etruscan, and are trying to trace its affinity with, if not direct descent from, the Ugric branch of the Turanian, which comprises the languages of those numerous and nearly extinct races whose descendants still occupy the Arctic regions of Asia and Europe. Although treading on the less purely conjectural ground of speculative linguistic analogy, Professor Koskinen's work may be said to aid that of Herr Hunfalvy, since in his Finnish *History of Finland* he throws considerable light on the ethnological condition of the people in past ages generally, while he specially considers, and brings very vividly before his readers, the varying political aspects of their national destiny in recent and present times.

THE Geographical Society of Paris have received further details respecting the murder of MM. Dournaux-Dupéré and Joubert by deserters of the Chamba tribe, which add little to the account given in the *ACADEMY* of July 25. It

would appear that, when about seven days' journey from Ghadamès, they were met by seven individuals who declared they were perishing from hunger, and asked their hospitality. Their account seemed so satisfactory that, after being furnished with food, they were admitted into the caravan, when, suddenly taking advantage of an unguarded moment, the new comers threw themselves upon MM. Dupéré and Joubert, and their servant Ahmed-ben-Zerna, and murdered them. The Chambas then stripped them of their clothes and carried off all their property, with the exception of a few printed European books which they left upon the ground. The account was brought back to Ghadamès by the camel drivers, witnesses of the murder, who were spared by the assassins as neutrals. Had the unfortunate travellers not fallen victims to the Chambas, it is most probable they would never have reached the end of their journey, as a band of ten Tuareg Huggars were also on their track, but turned back when they heard the Chambas had effected their purpose. The guide Nahéur-ben-Ettahur, who had arranged their murder with the Chambas, had been sent to prison by the caïmacam of Ghadamès previous to their departure, his bad faith having been discovered by the travellers. It appears that the caïmacam of Ghadamès had entreated them to desist from their journey to Ghat. Notwithstanding this catastrophe, another exploration of the Sahara towards Timbuctoo is being organised by M. Largeau, of Geneva.

THE LATE M. GUIZOT.

THE story of M. Guizot's life is the political history of two reigns, and the natural history of a class. It is recounted with perhaps inevitable partiality in the *Mémoires pour servir à l'Histoire de mon Temps*, and it needs a canvas as broad as that furnished by those monster volumes to be rendered faithful as a portrait, or instructive as a lesson. The great parliamentarian—whose rule did most to ruin the reputation of parliamentarianism in France—would have strongly objected to a miniature; and he was fortunate in living a life, in presenting a personality, that cannot be compressed. Most French statesmen and active political writers of the younger schools can be sketched in a few strokes of the pen; an epigram can define them—and that definition has seldom been wanting. They have been servants of an *idée fixe*, men with a settled pet system and panacea; and the lives and characters of such men may be generally summed up without injustice in a few sentences. M. Guizot was the type of a more ancient and more complex species. He brought the logic of the schools to bear upon the debates of a parliament; he argued from far-off historical examples to audiences that seldom went further back in history than the file of last year's *Moniteur Officiel*; he quoted Tacitus in the Chamber of Deputies—an indignity to which no member would venture to subject the present Assembly at Versailles. He was cast in the ancient rigid English mould, with all the Anglo-Saxon inclination towards cautious compromise. He was the last—for M. Thiers is a very vaudevillist beside him—classic statesman, and contrasted strangely with the fierce Romantic legislators who—be they De Morny or Jules Favre, Louis Blanc or Changarnier—have held the tribune since the February Revolution. Politically, he adopted Mazarin's motto *le temps et moi*, and M. Guizot probably laid the greatest stress on the last monosyllable. His continual and emphatic self-assumption was undoubtedly one of the chief causes of the dislike with which his own party regarded him. His unpopularity outside the Chambers was simply due to the fact that he despised popularity, and showed his contempt. Conservative, Republican, or Imperialist, few of the many prime ministers who have held portfolios in France during the last sixty years have dropped them without having enjoyed their hour of ovation, their share of *vicats*. Liberal, Im-

perialist, or Orleanist, Guizot never obtained more than the added eggs. Nor as an historian and pamphleteer was Guizot's reward ever equal to the effort and long labour of production—that is to say, supposing the crown of a literary life to be the praise and gratitude of men, and not the power and emolument of office. Guizot was ever suspected of using every volume he produced as a stepping-stone to a political pedestal; and the outlines of his life, the enumeration of his many works does not altogether allay the suspicion.

Pierre François Guillaume Guizot was born at Nîmes in 1787. A child of seven, he saw his father led by the Terrorists to the guillotine, and immediately afterwards was taken with his proscribed family to Switzerland. There the Calvinists could live in peace, and there Guizot probably acquired much of that frigid sternness of demeanour, that impassable hardness of character that made Royer Collard—himself no well of the milk of human kindness—say of him, “De la tête, beaucoup de tête, et peu de cœur.” He was educated gratuitously at the Gymnasium of Geneva, and at nineteen went to Paris to study for the bar. But the studies were soon discontinued. The student was too poor, too ambitious to waste five years of his life in earning the barren title of Doctor of Law. M. Stopfer, a former member of the Swiss Government, employed him as tutor to his children, but here Guizot's pride rebelled at some of the minor consequences of his dependent position, and he left his charges, taking with him a work that had been planned to facilitate their studies. This work, the *Dictionnaire des Synonymes*, was published, and procured for him an introduction to Suard, the Secretary of the Institute, and the Censor, who, in 1774, waged a fierce war with scissors against Beaumarchais' Essays. This patron procured for Guizot an entry into the principal literary and political journals of the epoch, and it was at his instigation, if not with his help, that he wrote his first literary works, *Annales de l'Éducation*; *Vie des Poètes Français du Siècle de Louis XIV.*; and *L'Espagne en 1808*; but the monumental translation of Gibbon's *Decline and Fall* was planned and executed by Guizot alone. Academical circles opened their arms to the young author, but he resisted their solicitations for yet a little while, and tried his hand at lighter literature in *L'État des Beaux-Arts en France*, and a pamphlet on the Salon of 1810—works which drew down upon him the scathing satire of his master in criticism, Gustave Planche. Then Guizot took refuge in the University, and was appointed Professor of Modern History. About this time, 1812, there were ominous cracks and tremors in the elaborate edifice of the Empire, and M. Guizot was not slow in interpreting the symptoms. His marriage with Mlle. de Meulan, a writer in the *Publiciste*, of decided Legitimist opinions, procured him a seat in the secret councils of the Club de Clichy—the centre of the Bourbon conspiracy, conducted by Montesquiou and Royer Collard. Both proved their gratitude to the neophyte. Called to the Ministry of the Interior on the return of the Bourbons, Montesquiou appointed Guizot his general secretary, and subsequently Royer Collard entrusted him with the framing of the famous Press Law, which sixteen years later served as the model of Charles X.'s tyrannous *ordonnances*—when, by the by, M. Guizot found himself enrolled in the ranks of the Opposition. Guizot was Censeur Royal when Napoleon returned from Elba—and for six weeks managed to retain his place on the Ministerial staff. Scandalous stories have been based on this circumstance, and grave doubts were entertained as to the Censor's fidelity to the Monarchy. They were, however, dispelled when he took refuge at Gand and edited the *Moniteur de Gand* in the Royalist interest. At the second Restoration he resigned his post of Censor, and was named *Maitre des Requêtes* and Councillor of State—functions which

permitted him to resume his literary labours. The result was a few political pamphlets and essays of a pseudo-Liberal kind: *Quelques Idées sur la Liberté de la Presse*; *Essai sur l'Instruction Publique*; *De la Souveraineté et des Formes du Gouvernement*. He obtained promotion by the publication of a subtly disguised plan of electoral corruption, which he was appointed to carry out under the title of Director General of Communal and Departmental Administration. From this moment he possessed political influence, and with Royer Collard, the Duc de Broglie, and M. Molé formed the party of the Doctrinaires—a word created to describe Guizot. It was the nucleus of the “Juste Milieu” which acquired such importance a few years later. Guizot set his face sternly against the ultra-Royalist reaction that followed the assassination of the Duc de Berri, and thenceforth the Doctrinaires were Orleanists, all but revolutionists. It is at this date that Guizot published the powerful criticisms: *Examen du Gouvernement de la France depuis la Restauration*, in which he abjures his Legitimist faith; *Des Conspirations et de la Justice Politique*, a plea which he practically denied under Louis Philippe; and *Des Moyens de Gouvernement et d'Opposition dans l'État actuel de la France*. His chair at the University became a political tribune, and his lectures were prohibited. These lectures were subsequently published as essays on *La Civilisation en Europe*, and *La Civilisation en France*, which are among his best known works. In his enforced leisure he edited the *Encyclopédie Progressive* and the *Revue Française*, and wrote his *Histoire du Gouvernement Représentatif*, a treatise on capital punishment for political crimes, an essay on Calvin, and numerous works on the English history and literature.

It is scarcely possible to follow Guizot through all the parliamentary intrigues and ministerial crises of the Orleanist era. He stamped the reign with his dominant vice—cool and impenetrable egotism. He raised the cry “Enrichissez vous!” He made venal ministers and a venal Parliament; he made corruption deliberate, and systematised a theory of government; as Cormenin said of him, “il faisait pourrir son siècle,” and those who were startled by the nerveless, soulless way in which France accepted the yoke of the Second Empire, by the quick collapse of all the national energies at the outset of the last war, have not read the history of the Guizot régime aright. M. Rouher did little worse than complete and extend the system of Louis Philippe's minister. To add that while the minister corrupted and preached corruption, he remained himself incorruptible, is to say little in his favour: he is a clumsy fisher of men who hungers for the bait upon his hooks. M. Guizot remained to the last the doctrinaire Minister of Louis Philippe, learnt nothing and forgot nothing, while his rival Thiers learnt as many parts as he forgot. At the *coup d'état* his political life was virtually at an end. In the quietude that followed expulsion from power his most enduring works were composed: *L'Histoire de la Révolution d'Angleterre*; *L'Amour dans le Mariage*, Guillaume le Conquérant, Edouard III. et les Bourgeois de Calais, *Mémoires pour servir à l'Histoire de mon Temps*; *L'Eglise et la Société Chrétienne*, the famous defence of the Papacy; *Histoire Parlementaire de France*, *Méditations sur l'Essence de la Religion*, and *Histoire de France racontée à mes Petits Enfants*, a work which we believe the author has left nearly completed. Save *Guillaume le Conquérant*, *L'Eglise et la Société Chrétienne*, his last work, and one or two productions destined for the use of schools, Guizot's works are very little read in France. With the mass of the public his reputation was purely political; his literary authority was accepted without enquiry on the strength of the Academical approbation. The first element of contemporary popularity is the power of entertaining. Guizot had much to tell, but he had never perfected himself in the best way of telling it.

CORRESPONDENCE.

HEBREW COINS.

Guildford: Sept. 15, 1874.

The question raised in your columns as to the authenticity of certain Hebrew coins lies in a nutshell. Any coins of a specific gravity not exceeding that of pure silver have, so far, a good, though not a conclusive title to be regarded as genuine. Any coins of a specific gravity in excess of that of pure silver must be of other than legal issue. The question is one solely of fact; and I cannot conceive that it should be pursued with any aim but one, that of the discovery of the truth.

It is in this light that the discovery of any new Jewish coin has an importance far higher than that of the individual value of such a coin. It is as an element in the general theory of Hebrew coinage, that it is most essential to regard it. This theory I venture to consider as extremely unsatisfactory; not only from the discrepancies between such high authorities as M. de Saulcy and Mr. Madden as to the attribution of certain coins, but still more from the entire disregard of the full and definite information which Hebrew literature supplies as to denominations and weights.

In the works of the writers to whom I have referred we only read of shekels, and their fractional parts; the same word being applied to both silver and copper money. But in the Talmud we find no less than thirty words used to denote money. We have nine denominations of silver coin, of which the definite weights are given; and we have an equal number of copper coins specified, of which the mutual relations, and the relation to silver, are stated, although the absolute weight is not added. A very perfect and symmetric monetary system is thus shown, on indisputable authority, to have existed for a very long period of time. It does not seem to me satisfactory to ignore this

literary fact, in discussing the subject of Hebrew money.

The weight of the coin now usually called the shekel is only one element in this general system. The coins usually termed shekels do not amount to more than three-fourths of the legal weight of that piece of money. The normal weight of 220 grains troy has been assigned by Mr. Madden to this coin, although specimens exist of 224 and 228 grains weight; and it is a good numismatic rule that coins are found below, but not above, their proper weight. The book of Exodus assures us that the Ciccar, or talent, contained 3,000 shekels. The Talmud fixes the weight of the shekel in question at 320 grains. The Babylonian talent, in best preservation at the British Museum, is within one *per mille* of this determination, being 959,040 grains, instead of 960,000. Surely these evidences are conclusive.

I must not now intrude on your space further than by a brief reference to the use of the word "stater" by St. Luke, as the coin paid in satisfaction of the Temple tax for two persons. This word is the translation of the Chaldaic "righia," or three-quarter shekel, which we learn from the Talmud was, at a comparatively late period, adopted as a compromise to regulate the Temple tax; the priests demanding the Sela shekel, and the people proposing to regulate their payment by the zuza, or quarter shekel. As to the presence of the words "Shekel Israel" on these coins, I have found them on a silver coin of sixty-three grains weight. They cannot, therefore, denote the name or denomination of the coin, at all events absolutely.

Even more important than the question of weight, is that of date; and this is one on which each new specimen of a Hebrew coin may throw light. From the time of John Hyrcanus to that of Agrippa II., a tolerably regular series of coins exists, from the careful study of which some information is to be derived as to the gradual palaeographic change in the letters employed. These eponymous coins amount, according to M. de Saulcy, to seventy-eight (in 1854); and, according to Mr. Madden, to ninety-eight (in 1864). Fifty-three anonymous coins according to the former, and forty-five according to the latter writer, are attributed to three brief periods of Jewish history, amounting in all to eight or to nine years; these periods, moreover, being widely separated by dated coins. It seems to me that this assumption has the tendency to arrest the study of a branch of enquiry from which the most important historic results may be expected by the aid of patient investigation. With this view, every coin, and every variety of coin, deserves a study, and may prove to have an importance far higher than can be assigned to it if we take as determinate the actual theories of even the most elegant writers on the subject of Hebrew weights and coins.

FRANCIS R. CONDER, C.E.

"SCIENTIST," &c.

26 Argyll Road, Kensington, W.

The convenience of the American word "scientist" for "man of science, scientific man," is bringing it into use, notwithstanding its barbarity. If *-ist* is to be considered a simply English, and not a Greek termination (and why should it not?), then "scientist" would be the word, like "physicist," "purist," and so on. But in "scientist" we have *-ist* added on to a root, "scient," which does not exist in English. But why should not that word exist, precisely in the sense we want, the translation of the French *savant*? Have we not an incumbent, an innocent, a crescent, a precedent, an antecedent, an accident, an incident, a resident, a president, a respondent (and alas! a co-respondent), a correspondent (a much happier man), a student, an agent, a regent (at least we had one when I was a boy), a tangent, a client, the orient, a patient, a deponent, an ex-

ponent, a serpent, an adherent, a current, a patent, a penitent, a fluent (in fluxions), an affluent, an insolvent (alas!), all formed from Latin participles in precisely the same manner? Hence, I beg leave formally to introduce a *SCIENT* into this heterogeneous company (from "an incumbent," through "a president," to "an insolvent"), and to propose that this strictly formed dissyllable should take the place of the American barbaric trisyllable "scientist." A "scient" would not mean one who "possesses knowledge in general," so much as one who rejects all but knowledge for the foundation of hypotheses, and therefore constructs only with such materials as he already "knows." A "scientist" would then be an "adherent to sciences."

A gentleman wrote to me the other day to know whether he might say *pharmacist* in place of *pharmaceutist*, because of its more evident relation to *pharmacy*. I could only answer, why not? All the words have fallen from their Greek sense. "Pharmaceutical," which the same gentleman tells me is in America reduced to "pharmaca," has a Latin appendage to a Greek word, while the Americanism takes the Greek root "pharmak" (the origin of which is more than doubtful, though its meaning as "poison" is only too well fitted to characterise the wares of a modern "pharmacy"), and claps an English (no longer a Latin) *-al* to the end. Here America is not only shorter but more legitimate—if there is such a thing as legitimacy in word-formation, which I have long doubted for reasons far too many to unfold. "Pharmaceutic" or "pharmacie," without the *al*, would be more Greek, and, comparing "therapeutic" and "thoracic," more (medical) English. But on a recent occasion I have found it necessary to make many compound words out of syllables which refer to other words, like chloroform = *terchloride* + *of* + *formyle* (as we may suppose), and chloral = *chlorine* + *alum* (as we know). When I was at Cambridge, there was the *Camus*, looking very like a Latinisation of the river *Cam*, but really representing Cambridge Amateur Musical University Society—the order of the words a little twisted for euphony, as "cuams" would have been puzzling. In the same way we remember Charles II.'s *Cabal* Ministry. We want words of a reasonable length to express conceptions which often require a treatise to develop, and which consequently cannot be expressed by that very rough and rude system of compounding words which we have inherited from our Aryan ancestors, and which some of the German sesquipedalian, and modern chemical "sea-serpent" polysyllables have reduced to an absurdity. There is that fearful word "utilitarianism," invented by Mill, and utterly unintelligible without a book on its long back. The root is "ūt," and the simple "uty," rhyming to "duty" (a most significant rhyme, by the bye, in this case, leading to the foundation of *duty* on *uty*), would answer all the purpose, while "utilitarians" (another awful word of the *-arian*, or Aryan class) would be reduced to "utians." Long ago De Morgan wished to contract "quantitative" and "qualitative," which are difficult words for the tongue, into "quantitive" and "qualitive," but "quanty, quantive, qualty, qualive" would be enough for "quantity, quantitative, quality, qualitative," and such onissions of unaccented syllables are the life of modern Romance words.

As a philologist, in the strict sense of a word-lover (a "phillog" would be quite enough, and "phillogy" would name the science), I feel that the time has come for meeting the wants of the age by new creations, sufficiently near the old in sound to pass current in speech and on paper. The last great effort in this way, for which all must be thankful, was Van Helmont's invention of the word "gas," which has no further root than his own brain. Pott, who has just completed his *Lexicon of Roots* (and a wonderful work it is, full of suggestion for new formations), and

those who cling to Arvanism, believe that the age of root-formation (like the age of miracles), is stone-dead. I believe both are alive. As in my own half-century of life I have witnessed the change from an eight-penny letter to Cambridge, to a shilling telegram to John o' Groats, or Penzance, or Tipperary, and a three-penny letter to any part of America, or Germany, or France,—I feel to live among what would have once been called miracles. And as the progress of science has continually forced us to invent new terms, and often to adopt the expressive monosyllables invented by workmen for their own use, I feel that root-formation must have a new start, and that root-treatment by derivations through affixes and internal changes, and by compositions of half-words or letters, thus combining in one system the Aryan, Semitic, and North American Indian plans, with, when convenient, the Turanian agglutinations (as in our titles of companies and Acts of Parliament), must undergo a "conscious development," to supplement its former unconscious development. The Aryans had not much else but war and agriculture to guide them. We have not only these, but poetry, philosophy, science, art, commerce, and politics. The "phillog" must become a "scient." These two classes of thinkers have been so widely separated that it has hitherto been almost thought a *lusus naturae* or "sport" (a most expressive botanical term) when a University man took a good "double first." But we are "changing all that," and "phillogy" and science will henceforth go hand in hand. "Barbarity," which I used in my first sentence, should in "phillogy" merely mean a foreigner's application of his own habits of speech to roots taken from another language. The secondary meaning of "savage and uncivilised life" has nothing to do with "phillogy," that is, is "unphillogic." But remembering that all our present word-system is a field inherited from the uncivilised, and traditionally tilled without a scrap of scientific cultivation, we should rather shun this secondary sense of barbarity when applied to words, as a defilement of the tombs of our ancestors. Words are the garment of thought; as thought grows, it must have fresh suits.

ALEXANDER J. ELLIS.

THE DATE OF "RICHARD THE REDELES."

Berlin, S.W., York str. 2: Sept. 13, 1874.

Your kind notice in the *ACADEMY* (June 13) of my essay on *King Richard II.*, encourages me, now that I have read Mr. Skeat's valuable notes to *Richard the Redeles*, to address these lines to you; for, guided by those notes, I have re-examined the subject, rectified several of my mistaken notions, and stumbled on a few questions which I should like to see discussed and examined by competent judges. Will you allow me to lay them before you?

As to the authorship of the poem, Mr. Skeat's arguments are so convincing, that no more needs be said about it; but I do not feel equally sure that Mr. Skeat is right in restricting the date of the poem to *September, 1399*. Several passages will admit of a more satisfactory interpretation if we are allowed to refer them to events posterior to Richard's deposition, and I really believe I can show from the poem itself that *Passus III.* and *IV.* were written after Henry IV.'s accession.

In the first instance, there is in *Passus II.* an allusion to a fact which can be proved to have happened in *October, 1399*, several days after Henry's coronation. I mean the fact of Sir W. Bagot's having been publicly reproved at the Parliament. *Pass. II. l. 170*, we read, "This lord"—which by Mr. Skeat's showing, too, means Bagot—"was,"

"l. 174. . . brought to the brydd, and his blames rehersid.

"l. 175. *Previly at the Parlement*, amonge all the people."

Now, the *Parlement* mentioned here cannot

have been that summoned in *September*, which certainly had no time left for Bagot's affairs, for it held only *one* sitting, the famous one of *September 30, 1399*, which was sufficiently filled up with deposing one King and instituting another.

The new Parliament under Henry was summoned for *October 6*, but did not transact any business till Tuesday, *October 14*, the day following Henry's coronation; and it was Thursday, *October 16*, that Sir W. Bagot was called to the bar of the House. On that day his bill against the Duke of Aumerle was read, and he himself charged by the Duke of Exeter with having plotted against Henry of Lancaster's life. Holinshed (ed. London, 1808, vol. iii. p. 5) adds to his account, that to this accusation Bagot made no reply, and states that "on Saturday ensuing Bagot was once more brought to the bar (together with J. Hall, one of the Duke of Gloucester's murderers), examined, and sente ayeine to prison."

Is it possible to doubt that this account, which is followed by Shakspeare, furnishes the key to the passage quoted above? That the "*Parlement*" in l. 175 was Henry's first? That the scenes related by Holinshed were before the author's mind when he wrote, in *Pass. II.*, the lines 164 sqq.; and that, consequently, those lines were written after Henry's accession?

But even without this direct proof as to the time of the composition, a comparison between the first two, and the last two *Passus*, will lead to the conclusion that the former were written before, the latter (*Passus III. and IV.*) after, Richard's formal deposition. The difference between these two parts is striking. At the beginning, in spite of the author's doubt as to "what shulde fall," Richard is treated by him as his liege lord, his lawful Sovereign, and, in conformity with the author's declared intention of writing "him a writte to wissen him better," every line is addressed to the King personally; "thou" and "you," mean, with rare exceptions, no one but Richard himself; for instance: "Now, Richard the Redeles, reweth on yourself," &c. This address to Richard as the misguided sovereign persisted in till near the end of *Passus II.* *Passus III.*, however, most significantly opens with an investigation into the causes of Richard's fall (*Pass. III. l. 3*, p. 486: "whi the hie hertis her hele so mysside"); and immediately after there follows the fable of the partridge, in which Richard—now no more *spoken to*, but *spoken of*, as a third person; for instance, *P. III. l. 110*, p. 490: "Arere now to Richard and reste here awhile"—is represented almost in the light of an intruder, as the "wrong leader," whilst Henry is depicted as the true father, and openly declared to be (l. 92, p. 489):—

"The heed of hem all and hieste of kynde
To kepe the Croune, as cronecle tellith."

It is impossible to believe that these words, an evident vindication of Henry's claim to the crown, should have been written in an address meant to reach Richard's hands as long as he was the lawful sovereign; however, it is easy to account for them, and for the fact that in *Passus III. sqq.*, the author no longer addresses himself to Richard, but to a general reader, if we suppose that, in the midst of his writing, he was surprised by the news of Richard's deposition. This news would naturally interfere with his plan of sending a letter of advice to Richard, but could not dispose him to give up writing altogether; for when W. Langland, the moralist and public instructor, took up his pen, he did not think of Richard only, but he "travelled on his tretis to teche men hereafter" (*Prol. 51*); his "will" was that it should be read by a great many young and old (*Prol. 64 sqq.*, p. 472), and that, the laying open of the faults of Richard's reign should be "for the best" even of "Kyngis and Kayseris comynge" hereafter (*l. 85*, p. 476).

We may, therefore, safely presume that the announcement of the deposition did not put an end to the poem. The author simply drops his

address to Richard, and, turning from him to the public, continues to show the evils of Richard's lawless and unprincipled government, and point at the blessings to be expected from Henry, the friend of the people.

This view, allowing the author a longer space of time for his composition, and a wider scope for the interpreter, is consistent in itself, seems in harmony with Langland's character as a careful writer, and removes several difficulties in the interpretation of the poem.

C. ZIEPEL.

NEW SHAKSPEARE SOCIETY.

Skipton: Sept. 12, 1874.

Will you allow me to inform your readers that the non-appearance of the editions of *Henry VI.* and *Romeo and Juliet*, announced so long since in your journal, is not due to any neglect of mine? They have been ready for the press a long while, and I had put myself to much personal inconvenience to get them so. On the *Henry VI.*, in particular, I have spent more than 500 hours of hard work. Yet this evening I receive notice from the Committee of the Society that they do not intend to proceed with its publication. No reason is assigned; although the very last communication I received from the Director was to the effect that Messrs. Childs had now procured a very large fount of old type, and were ready to go on with printing this play.

F. G. FLEAY.

POSTHUMUS IN "CYMBELINE."—A "CORRECTION" CONFIRMED.

3 St. George's Square, N.W.: Sept. 12, 1874.

Mr. Fleay has done his best to make my instances—

"The res|idence | of Pös|thumus: | so nigh | at least."
—III. iv.

"A head|less man! | The gar|mments of | Posthúmus."
—IV. ii.

"fit his theory" that the first is Posthúmus, and the second Pósthumus. Can he deny that the accent is on the first syllable in one, if not both, of the following lines:—

"Thy heart | to find it. | Is she | with Pös|thumus."—
III. v. 87.

"Unless | thou wouldst | griete quickly. | This Pös|thumus."—V. v. 170.

Only one instance is needed to upset Mr. Fleay's "almost decisive" test, and to show that Shakspeare used Pósthumus and Posthúmus in *Cymbeline*, just as he used Dúnsináne and Dunsinane in *Macbeth* (see *Notes and Queries*, September 5), to suit the varying needs of the beat of his verse. Mr. Fleay's other arguments in favour of the earlier date of this scene ii. of act iv. of *Cymbeline* have exactly the same value, in my opinion, as his Posthumus one—that is, none at all. Because II. i. of the *Tempest* "has a much greater proportion of rhymes [in the 5-measure blank verse] than any other scene in the play;" two: "done, son," the rest having none—is that a reason for the earlier date of this scene? Because a noble dirge is afterwards inserted for a weaker one, or a blank, in *Cymbeline* IV. ii., is that a reason for the whole scene being earlier than the rest of the play? I do regret greatly Mr. Fleay's riding his rhyme-hobby so hard as to make him catch hastily at any seeming support for his views and thus ruin his criticism of special plays. His paper on *Julius Caesar* is the weakest I ever read. It has been the main cause of my epithet "incautious" (so printed in my comments on his *Macbeth* and *Julius Caesar* paper) for at least eighteen of his statements in the proofs of his later papers for the New Shakspeare Society, of which he has already withdrawn or modified twelve. But this general question, which I only allude to at Mr. Fleay's request, cannot be discussed in the *ACADEMY*. The special point which I have proved is, the one I originally maintained in *ACADEMY*, September 5, that "at any rate, one of Mr. Fleay's

statements (as to Posthumus in *Cymbeline*) is wrong, if not both," so that his "almost decisive" test altogether fails.

FREDERICK J. FURNIVALL.

* * We cannot receive any further letters on this subject.—ED.

SCIENCE.

THE MEETING OF THE INTERNATIONAL CONGRESS OF ORIENTALISTS.

THE second meeting of this Congress was opened in London on Monday evening last by a moderately full gathering in the theatre of the Royal Institution in Albemarle Street.

Representatives have been sent to the Congress on the part of the following countries: Germany, (Prof. Lepsius), the United States of America, (Prof. W. D. Whitney), France, Algeria and the French Colonies (3), Russia, Finland, and Poland (3), Holland, Belgium, Italy, Switzerland, Sweden and Norway (2), Hungary, Luxembourg, Portugal, Roumania, and Japan.

Among English philologists who have attended the Congress, we may mention—Dr. Birch (President), Professor Max Müller, Sir Henry Rawlinson, Sir W. Elliot, Dr. Muir, Dr. Rieu, Dr. Rost, Mr. Cheyne, Professor Childers, Mr. Sayce, Mr. Cull, Professor Wright, Dr. Legge, Mr. Edkins, Professor Cowell, Professor Douglas (Secretary), Mr. Caldwell, Bishop Callaway, Mr. Alexander Ellis, Professor Eggeling, Mr. Bensley; as well as the following persons eminent in other branches of knowledge—Sir John Lubbock, Mr. Grant Duff (President of the Archaeological section), Professor Owen (President of the Ethnological section), Mr. E. B. Tylor, Mr. Newton, Mr. Vaux, Mr. Bonomi, &c.

Among foreigners who have arrived, the following names will be most familiar to English readers:—Brugsch Bey, Professors Jules Oppert, Chwolson, Weber, Dillmann, Eisenlohr, Euting, Gosche, Haug, Krehl, Hunfalvy, Lepsius, Merx, Nöldeke, Pertsch, Roth, Schrader, Léon de Rosny, Brockhaus, Stenzler, their Highnesses the Prince and Princess of Roumania, and the Syrian Patriarch with his Suffragan the Bishop of Jerusalem.

The President took his seat at half-past eight, and delivered the following

INAUGURAL ADDRESS.

This second meeting of the International Congress of Orientalists is an event of more than ordinary importance in the annals of Oriental studies. The fortunate idea of bringing together students of congenial pursuits to interchange thoughts, to discuss points of common interest, and to make each other's acquaintance is due to the exertions of M. de Rosny, who, I am happy to say, has given us the favour of his company to-day. It was founded in Paris in 1873. The warm interest ever shown by France in Oriental studies, and the high distinctions long ago attained by the celebrated men of that country, most of whom have unfortunately passed away from us, but whose labours adorned the country to which they belonged, made Paris a most appropriate site for such a Congress. At the close of that Congress—September 6, 1873—the vote of those present determined, notwithstanding brilliant offers and pressing invitations from other countries, that this second Congress should be held in England and in this great city, distinguished for its extent as well as for its devotion to the study of the East, and connected with that East by a thousand ties, the interests of commerce, the spread of civilisation, missionary labours, and the duties of governing Oriental dependencies of various tongues and sites in that East which is to-day the object of our meeting and the subject of our thoughts. In order that the Congress of Paris might have a successor, it was necessary to elect a President in this country, and the nomination fell upon myself. In undertaking the duties of such an office, I

was well aware of the difficulties involved in the task. A President, gentlemen, at the present day is not merely a name or a sinecure, he is a reality, an administrator; and, however ably seconded by his secretaries and his committee, he has yet a great deal of detail to manage and many arrangements to effect. In the presence of so many who are more versed in the duties of affairs than myself there is but one thing to ask you, and that is your cordial co-operation with one who accepted the office under the feeling of his own deficiencies for the task, and of the necessity that some one should promptly step forward to continue the work which had been begun, and which promises to be of such great advantage to Orientalists. Our first duty is to announce the favour with which the movement has been received by the different States and Sovereignities of Europe, delegates from whom are present here to-day. Besides those gentlemen who appear as representatives of the different Powers of the North and West, others have come from the far East to add by their presence, by the information they bring and the objects they display, to the pleasure it will afford us to make their acquaintance. Here, gentlemen, I must tell you that the application made to the Secretary of State for India was received in the most kind and prompt manner, and that the Hindoo *savants* designated as likely to contribute by their presence to the success of the Aryan section were at once consulted by the Indian Government, who offered to send them to Europe to be present to-day at our first meeting. If from various causes they are not here, India is not without its representatives. An eminent civil servant of the Indian Government is here from the Presidency of Bombay, and will, I am sure, carry back with him to that Presidency the remembrance of the warm reception which you will accord him. There has been every desire on the part of the India Office to do all that has either been asked or lies in its power on behalf of the Congress, and you will see on the occasion of your visit to that Office that an admirable museum and an extensive library show that the Office is not indifferent to Oriental learning and studies. The advance of civilisation, is marked by the increased attention paid to the pursuits in which we are engaged. The spread of knowledge has not only rendered that popular which was at one time reserved for a narrow circle, but has elevated these studies in public estimation. In this country the bond which holds us to our Asiatic Empire, the links that connect our commerce with all the nations of the East, have rendered the intimate acquaintance with the languages, thoughts, history, and monuments of these nations not a luxury, but a necessity. Probably persons could be found in so large a city, if required, who could speak any dialect under the sun, or read any writing upon the planet. To whatever branch of Oriental learning any of those who have honoured the Congress with their presence to-day is attached, he will be sure to find some congenial mind to take a warm interest in his pursuits, interchange thoughts with him, or aid in the solution of his difficulties; nay, the pursuit of these studies is a kind of touch of nature—it makes us all akin, just as in the study itself everything that is individual disappears from the mind, except the pursuit itself. Orientalists too are all, so to say, men born of the same family, and, like a family, mutually interested in the success of their respective studies. Before that, as students, all the distinctions of race, creed, and nationality disappear or are forgotten. Even criticism ought neither to be nor become personal, inasmuch as science places for its object the highest scope of the mind—truth—which is in most cases difficult to find and no reproach to miss. The nineteenth century has seen the revival of Oriental learning; and the great discoveries made throughout the East, in Mesopotamia, Egypt, India, and Persia, have thrown an entirely new light on the ancient monarchies, religions, and languages of the East-

ern world as it existed forty centuries ago. This has been due to several causes, chiefly to the improved facilities of access by which travellers and others have visited these countries and their monuments, and have excavated their remains, and partly to the advance made in Europe itself, which has enabled the monuments discovered to be more accurately copied. The extensive excavations made throughout the East, and the continuous explorations of modern travellers have left no accessible monument uncopied; and the quantity of the material now placed at the disposal of the student is consequently immense. With the increased number of texts of the old East has come more accurate knowledge, based on the power of comparison now given to the students. These materials were unknown to enquirers of the previous century. Empires have been exhumed, and for the first time a contemporary history of recorded events has been found. In Egypt the most recent excavations of M. Mariette have added considerably to the knowledge of history and geography, by the discovery of the numerous names on the Pylon of Karnak recording the foreign conquests of Thothmes III. These, in a paper lately read before the Academy of Inscriptions, enabled him to attempt a more accurate classification of the Egyptian names of countries. In Mesopotamia the missions of Mr. G. Smith and his diggings amid Kouyunjik have added extensively to the completion of Assyrian texts, elucidating the history and religion of that people; while in India the labours of General Cunningham promise to bring to light and classify the different monuments and antiquities which he explores and records. The first discoveries, it will be remembered, were due to the unearthing of important monuments, and it appears almost a subject for the consideration of the Congress to recommend that every reasonable facility should be accorded in the East to excavations undertaken purely from a scientific point of view; for those branches of excavations which follow up the hints afforded by monumental information require continually this discovery of fresh materials to stimulate the student, and without them the study languishes. It will also be remembered that the oldest languages are found almost exclusively on monuments, and that with the exception of Egypt, all the ancient records being of fragile and perishable materials, have been lost or destroyed. Continuous excavation is therefore requisite to obtain fresh material; for, as already remarked, without fresh material these studies languish, and the interest in their pursuit diminishes. It is not possible here to enter into details of all the most important of the monuments, and their contribution to the advance of Oriental knowledge, but there are two of supreme importance, discovered in times comparatively recent, which rise to the mind at once—the tablet of Canopus, found by Professor Lepsius amid the ruins of San, the ancient Tanis, and the bilingual inscription of Dali obtained by Mr. R. H. Lang in the ruins of Idalion in Cyprus. The tablet of Canopus has proved beyond a doubt, if such still lingered, the truth of the discovery of the Egyptian language and the decipherment of the hieroglyphs; the inscription of Dali has led to the decipherment and interpretation of the ancient Cyprian language, about which erroneous notions had hitherto prevailed, but which has now been discovered to belong to the Aryan family and to the Hellenic group of that section of languages. These, indeed, are only the most striking examples of the philological value of newly-discovered inscriptions; but those from Mesopotamia and Egypt are scarcely less remarkable for their contributions to the historical knowledge of those ancient empires; while the celebrated Moabite stone or inscription of Dhiban has presented a new page to the history of the Semitic people contemporary with Judaea, and one of the oldest texts in the characters of the Phœnician alphabet and its

different classes. It is a most valuable document of the Palæography of the Semitic family emancipated from the cumbrous and perplexing syllables of the various kinds of cuneiform writing. From the importance of the Congress's encouraging, by its sympathies, further excavations, I turn to another point which might engage its attention, and that is the transliteration of Oriental texts into European characters. Great progress in this direction has been made of late years and many schemes have been proposed. In some instances, the learned societies and scientific journals have insisted on the adoption of particular systems for papers admitted into their pages. There are many members present of all the Oriental Societies and Academies of Europe, and it will be for them to consider if some mutual agreement can be arrived at on this subject, and, for most Oriental languages, a decision favourable to one universal transliteration would be of the highest importance, as it would in many instances supersede the necessity of printing in various characters and different Oriental types, an expensive and difficult process. It would not, indeed, effect this for languages written with syllabic characters, but for those only which have an alphabetic one, and the same mode of transliteration would be an invaluable aid to the simplification and rendering of words in these languages, and making them universally intelligible. This subject will be no doubt submitted to the consideration of one of the sections of the Congress. It is, indeed, one of the subjects which it would be the especial object of the Congress to regulate, or at all events to initiate. That some such necessity exists and is felt is proved by the constant changes made by individuals in their transliteration of the words of Oriental tongues, whether living or extinct; the older systems already adopted not answering to the special notions of the manner in which these languages should be transliterated. Should the Congress be able to pronounce any opinion on this difficult subject, that opinion would no doubt carry with it great weight, even should it not finally decide the question, and lead to a further consideration of this pressing want of philological unity. It is not, perhaps, necessary for the Congress to consider how far it would be desirable to discuss the question of a universal alphabet—such a one as would supersede for Orientals themselves the necessity of writing in their own different characters the different languages distributed over the East. Could such be devised it would be a great advantage for the acquisition of those languages by the West, months and perhaps years being now spent in mastering alphabets and syllabaries of complicated kinds. Among the Polynesian islanders the European script has been successfully introduced and adopted, because they never had, till the appearance of European civilisation among them, a mode of writing; and there was consequently no national *amour-propre* to contend with, nor any script already in use to supersede. It is not so in the East, attached, from various causes, to their respective characters. But it is evident that, clothed in a European alphabet, there would be no greater difficulty in mastering many of the Aryan and Semitic languages by Western scholars than in acquiring the different languages spoken in Europe—a task much facilitated by their having one common mode of printing and writing the same sounds. It may be considered the first step to unity among the European nations will be this adoption of a common alphabet, when entirely carried out, and nothing would more powerfully connect the East and the West than the removal of those barriers which prevent an easy acquisition of those keys of thought necessary for the mutual understanding and happiness of mankind. It is a natural transition to pass from this subject to the consideration of the attempts making to introduce universal communication by means of Psigraphy, or writing by ciphers. This system has been for some time in use in the West, and different ways

have been proposed to arrive at the result. One is the mode of communicating by signals, consisting of numbers, at sea. Certain sentences of general use are numbered and translated into the different European languages. The flag which carries the number speaks the same sentence, when hoisted, to vessels of all other nationalities; in fact, the number is a universal medium of maritime communication. A flag with a few numbers asks a question; another with fewer or more gives the answer. Now, this device contains the elements of a universal language, limited indeed to a few stereotyped sentences such as are generally wanted in maritime intercourse. A modification of this system has been adopted for the purposes of commerce, for the Transatlantic and other telegraphs, to supersede the necessity of long and continuous messages, which would take too much time and trouble in transmission. But the works compiled for this purpose are in the English language only. A modification of this principle will be laid before the Ethnographical Section consisting principally in the substitution of numbers for words, the same number answering to the same equivalent word in all languages. It is evident that when dictionaries on this principle shall have been compiled, it will be possible for a limited communication to be held in writing with Orientals, of whose language the European is ignorant, in the same manner as by maritime signals. It is a step towards universal language, and, although a feeble one, probably the only step which will ever be made. Its value and defects will no doubt occupy the attention of the Ethnographical Section. It is not a language properly so called, but a means of interchange of thought, and might prove of the greatest value where other means were not at hand. Those divided by sounds will be united by numbers. The presidents of the various sections will deliver their inaugural addresses, after which the papers accepted will be read before the different sections, and the verbal communication will then be made. As some of the sections have many more papers than can possibly be read or discussed at a sitting, the president of the section will have it in his power to adjourn the sitting, should he deem it necessary, to another day, so as to admit of other papers being read. But it is evident that, in consideration of the numerous papers and subjects for consideration with which the Congress has been honoured, it may be impossible to read all communications, and some can only be noticed as received. Besides the sittings of the sections, which are detailed in the programme, the Congress will visit in the day-time the principal museums and institutions which contain objects of art and of antiquity connected with the East. Its first visit will be to the British Museum, where such members as are interested in the different sections will find abundant materials of the old and modern East to occupy their attention. The great Egyptian and Assyrian collections deposited in its galleries, and the numerous Phœnician, Punic, Hittite, and other Semitic inscriptions are particularly worthy of notice, and the visit will be preparatory to the sitting of the Semitic section, to which it will form an excellent introduction. In order to reduce the labours of the Congress to a definite order, the meetings have been reduced into sections, one for each of the five days from the 15th to the 19th inclusive. These sections are the Semitic, Turanian, Aryan, Hamitic, Archaeological, and Ethnological. They embrace all the topics, linguistic and scientific, connected with the East. The Semitic section will consider both the extinct and modern Semitic languages; in other words, to that section has been relegated the consideration of such Semitic languages as are written in Cuneiform characters, for the Cuneiform inscriptions include some certainly not of the Semitic family. But the mass of the inscriptions of Assyria and Babylonia are Semitic, and the characters and languages were extant from above twenty centuries B.C. to almost a century A.D., or the days of

the Roman Empire. The discovery of the reading of the Cuneiform by Grotefend in 1803 was one of the most marvellous applications of the intellect to the resolution of the problem of an extinct language of which there existed no bilingual inscription as a key. Since the evolution of the name of Darius, the study has advanced in an unprecedented manner, no fewer than five languages—viz., Persian, Median, Babylonian, and two sorts of Assyrian—having been deciphered and interpreted, and the history of these Oriental Empires having been examined from their original documents and contemporary sources, thus relieving us from the necessity of relying upon secondary information afforded by Greek and other authors. The discovery of the Persian by Grotefend, subsequently perfected by the labours of Lassen, Burnouf, and Rawlinson, was succeeded by those of the Babylonian and Assyrian by Hincks and Rawlinson; and it is precisely these last two languages which have produced a golden harvest of results, when completed by the labours of Professor Oppert, Mr. G. Smith, and Mr. Fox Talbot. A light entirely new has been thrown on the mythology and history of these old Semitic nations. The fact of another language, called the Accadian or Sumirian, extinct like the Assyrian, but not easily referable to a particular stem, although supposed to be of the Turanian stock, is an unexpected addition to the knowledge of the languages of Western Asia. It is not to be supposed that discoveries so startling have been received without incredulity or opposition. The nature of these languages, written in a complex syllabary which only finds its parallel in the abnormal script of Japan, and the difficulties which first attached to the decipherment of the names of gods and kings, caused the first attempts to be coldly received by scholars especially devoted to Semitic studies. These doubts have, however, since given way to convictions, and the truth of Assyrian researches has been finally recognised. The study of these ancient languages, which may be classed as extinct—in contradistinction to those which, though no longer spoken, have yet had their knowledge preserved by tradition, and which are called the dead—is strictly inductive. The examination of the logical deductions to be made from the position of a word in different passages is found to be as important, if not more so, in determining their meaning as their comparison with words in existing or dead languages supposed to be cognate. The consideration of some of these points will occupy the attention of the Semitic section as well as the nature of the grammar and structure of the Sumirian, the Elamite, and the Median. Besides these linguistic questions, others in connexion with the history and mythology of the old Semitic nations will be considered in that section. Nor is it more than necessary to revert to the priority that these early languages have in the study of comparative philology, owing to the undoubtedly remote age of the early monuments on which the languages appear, and their showing its change and development in the course of centuries. It is impossible to exclude these old grammatical structures, these oldest words, from the arena of that study, for without them the study must be considered as incomplete. The same observation also applies to the researches into comparative mythology and the evolution of ancient religions, for it is only by the consideration of the Semitic myths that a true appreciation can be made of the extent to which Western Europe was influenced by the traditionary legends of Babylonia and Assyria. The researches also into the astronomy of Babylon and Assyria are scarcely less interesting, and the evidence of the cuneiform records of these people goes far to confirm the high antiquity traditionally handed down of the astronomical observations of the Chaldeans. If that branch of the subject is at present incomplete, at all events the researches of M. Oppert and Mr. Sayce have

approached the subject, and it will be impossible to write the history of ancient astronomy with the omission of the Babylonian and Assyrian observations and astronomical knowledge. If, indeed, the astronomy of those nations was disfigured by, or due to, a superstitious astrology, intermingled with omens, some bearing a great affinity to the practices of the West, there still remains the comparison of the astronomy with that of Greece, which was derived at a later time from the Alexandrian schools. The historical enquiries have resulted in a still greater conflict of opinion, and M. Oppert will bring these divergencies before the section; for it cannot be concealed that the chronologies of the Jews and the Assyrians as they at present stand, do not harmonise—there is a want of synchronism. It is not possible to decide at present where the error lies, but nothing but an act of violence, such as the alteration of text, or the forced hypothesis of an omission of years in the Assyrian Canon, can at present reduce them to a common level. The difficulty has many bearings, and affects history generally; and could these differences be reconciled, that alone would entitle this Congress to be regarded as marking an epoch in the annals of ancient historical investigation. The unfortunately defective state of the present knowledge of the history of Babylonia, owing to the want of adequate monuments, which still lie inhumed in the country, prevents the investigation of the later history from being more accurately known, and some doubtful chronological and historical points from being settled. Considerable service to the publication of papers and memoirs on this subject has been rendered by the learned societies in this country, especially the Royal Asiatic Society, the Royal Society of Literature, and the Society of Biblical Archaeology, and by different scientific journals, especially the *Zeitschrift für Ägyptische Sprache* of Berlin. The Turanian section comprises all the languages of that class, and will in the present Congress consider subjects connected with the Chinese language and literature. It is not necessary here to do more than briefly allude to the extent of the literature of China, and the mass of old writings which have survived the repeated conflagrations which have overtaken it. Notwithstanding the labours of the French Sinologists, especially M. Stanislas Julien, numerous points of historical interest remain to be considered. One that came under their notice was the history of the Han dynasty, a period remarkable for its relations with other States, and its political reforms; for it was in that remote period that the system of competitive examinations was first introduced into the political organisation of the Chinese Civil Service. A translation of the most important works of that time was proposed at the Paris Congress, 1873, and, could it be carried out, would add considerably to the knowledge of the geography and ethnology of Indo-China. So many subjects of interest about Japan were discussed at the Paris Congress, that there remains scarcely any of great importance to treat of in the present Congress; but the study of Japan, its language and its literature, deserves our highest sympathy, from the remarkable phenomenon of the welcome Japan has offered to Western civilisation, and the fact of its interesting peculiarities of language and writing, notwithstanding the impress it has received from the Chinese script and literature. The comparison of its language with others of the Turanian family deserves great attention. One of the subjects which will be referred to the Turanian section is the interpretation of the Etrurian language. That tongue, which belongs to the extinct class, has exercised the ingenuity of Europe for more than a century, and the difficulty of solving the mystery has always been a reproach to the power of decipherment and interpretation exhibited in the rapid progress made in the Semitic Cuneiform and Hamitic Egyptian. Since the work of Lanzi,

European languages—Lanzi himself to the Greek and Latin, Sir William Betham to the Irish, M. Judas to the Hebrew, another enquirer to the Teutonic, and the Rev. Isaac Taylor to the Turanian stem. Mr. Taylor proposes laying his views before this section, and the subject is one worthy of the attention of the Congress, as in the discussion that will very likely ensue it will probably be shown whether it should be considered a Turanian or an Italian dialect, to which latter class the opinions of scholars have generally inclined to assign it. The views of Mr. Taylor will, however, have specially to be considered, and the proofs he wishes to bring forward in favour of his hypothesis will be passed under examination. The great difficulty about the Etruscan language is that the words do not appear to be directly connected with the Italian dialects as they are at present known, and the inscriptions are, although numerous, too short to enable sufficient comparisons to be made to determine logically the meaning of words not being proper names which are found in the different texts. The Aryan section will have papers on the Sanskrit literature and subjects connected with it, and the flood of light which the study of this language has thrown on the history of European languages has made it the most favoured of Oriental languages. There is supposed to be found the original source of the very tongue in which this address is delivered. It is, as all are aware, a literary not a monumental language, as no monuments inscribed in Sanskrit or its nearest dialects are older than the fourth century B.C. It is a problem yet to be solved what was the oldest Aryan alphabet. Was it Greek, Syriac, or Lycian? As yet none is known older than the seventh century B.C., and of course they are all comparatively recent compared with the Egyptian and Babylonian. Among the languages of the Aryan section, attention should be directed to the Lycian, as it is certainly one of the oldest which appear on the monuments. This dialect, limited to a small locality in the south-western coast of Asia Minor, and written in a mixed Greek and Phoenician alphabet, has not yet been interpreted to any extent, although the alphabet has been deciphered. It was in 1839 that the late Sir C. Fellows first brought to England trustworthy copies of Lycian inscriptions. Several of these were bilingual, and the language has been supposed to resemble the Zend; but the interpretation has been suspended, and although attempts have been recently made to affiliate it to the Slavonic, and even to one of the Norse languages, it must still be classed, like the cognate Carian, among the extinct or unknown languages of Asia Minor.

The Hamitic Section will represent the progress made in Egyptology since the first discovery of the mode of deciphering and reading this pictorial language of ancient Egypt in 1817. It is not necessary here to enter into a detailed exposition of the mode of decipherment and interpretation of the hieroglyphs which was aided by the trilingual inscription of Rosetta, and did not require so great an effort of the mind to discover as the cuneiform. The only difficulty was to divest the mind of the idea that figures and representations of objects were not used as pictures, but as phonetic ciphers. That point reached, the difficulties rapidly disappeared, and the inductive method, pursued with a mathematical rigour by the first enquirers and by later students has evolved alike from the grammar and the dictionary the relation of the ancient Egyptian to the Coptic. So great has been the progress made, that the purport of all texts, and the entire translation of most, is no longer an object of insurmountable difficulty. As in the case of Assyria, the history of Egypt has been revealed from the monuments, and a mist which hung over the learned labours of the past century has been dispelled, and although the chronology of Egypt presents unfortunately too many gaps to justify precise determinations, yet sufficient evidence has been obtained to prove the immense duration of the Egyptian empire. It is,

however, one of the marvels of Egypt and its early civilisation that it starts already full grown into life in the valley of the Nile as a nation highly advanced in language, painting, and sculpture, and offers the enigma as to whence it attained so high a point of development. There is no monumental nation which can compete with it for antiquity, except, perhaps, Babylonia, and evidence is yet required to determine which of the two empires is the older. As far as an opinion can be formed from archaeological considerations, there is a greater weight of evidence in favour of gradual development in Babylonia. Some of the linguistic tablets in terra-cotta found in that country have recorded the transition in that region in characters gradually developing from the pure pictorial into the conventional cuneiform, but no Egyptian inscriptions, as yet discovered, are written exclusively, or even mainly, in hieroglyphs used as pictures only in contradistinction to sounds. All, even those of the most remote antiquity, are full of phonetic hieroglyphs. The arts of Egypt exercised an all-powerful influence on the ancient world—the Phoenicians copied their types, and Greece adopted the early Oriental style of architecture, for the Doric style came from Egypt, the Ionic from Assyria, the later Corinthian from Egypt. If Phoenicia conferred an alphabet on Greece, Egypt suggested the use of such characters to Phoenicia. Already, in the seventh century before Christ, the hieroglyphs represented a dead form of the Egyptian language, one which had ceased to be spoken, and the Egyptians introduced a conventional mode of writing simpler than the older forms, and better adapted for the purposes of the vernacular idiom. Egyptian philosophy—the transmigration doctrine of Pythagoras—that of the immortality of the soul of Plato, pervaded the Hellenic mind from the colleges of Thebes. The wisdom of the Egyptians was embodied in Ethical works of proverbs and maxims as old as the pyramids and as venerable for their hoar antiquity even in the days of the Exodus. The frail papyrus, the living rock, the temple, and the tomb, have all preserved an extent of literature found nowhere else. The motive was a religion which looked forward to an eternal duration or the return of the past to the future. The national poem of Pentaur is found on the walls of Thebes, and the papyrus of Sallier. The Book of the Dead was alike sculptured on the tombs and written on the roll—it embodied much of the symbolic though less of the esoteric doctrine. The Elysian fields, the streams of Styx, burning Phlegethon, the judges of the dead, are Egyptian conceptions; the sun-worship is Egyptian; medicine and astronomy, geometry, truthful history, and romantic fictions are found in an extensive literature. Many dogmas and practices of an Egyptian origin have descended to the present day, and exercise more influence than is generally supposed on modern religious thought. Here it is not possible to do more than allude to the services rendered to Egyptian interpretation by Professors Lepsius, Brugsch, Lauth, Ebers, and Eisenlohr, in Germany; M. Chabas, the late Vicomte de Rougé, and M. Maspéro, in France; and Mr. C. W. Goodwin and Mr. Le Page Renouf, in this country. But it is in Berlin alone that a journal specially devoted to Egyptology appeals to us as the recognised organ of students of the language and antiquities of the valley of the Nile. From Brugsch Bey, who attends this Congress as the representative of that enlightened ruler the Khedive of Egypt (who has done so much for the revival of the knowledge of the ancient condition of the country over which he rules by the excavations he has sanctioned or undertaken at the suggestion of M. Mariette, and by the valuable publications of Brugsch Bey and M. Mariette, whose heavy cost His Highness has undertaken), the Hamitic section will hear a lecture of great interest on the point of departure of the Exodus from the land of bondage. The subject of Archaeology, both local and

general, has been the object of so many Congresses that only a small part of this vast subject can fall into the scope of the present Congress. Archaeology treats of the ancient Oriental ethnology—of the earliest and the existing civilisation of the East. Both enter extensively into the history of the human race, and without their aid no description of ancient life, however brilliant, is complete. The ancient monuments of India will come under the consideration of the Archaeological section, as also the always interesting subject of the great Pyramid, about which many opinions have prevailed, although the only one received by Egyptologists is that it was the sepulchre of a monarch of the fourth dynasty. There is one subject connected with the archaeology of the East to which your attention should be specially directed, and that is the extensive forgeries of Oriental inscriptions and other objects, perpetrated in late years at Jerusalem and in Arabia. With the increased value placed on works of ancient art the attention of forgers has been directed to the production of spurious monuments. Some of these are too gross to effect the deception they wish to effect, but others require a considerable practical knowledge of works of ancient art to detect. Now, the labours of the philologist are incomplete without the advice and assistance of the archaeologist, without which erroneous ideas may be entertained as to the relative value, the truth or falsity of ancient monuments. Hence an Archaeological section which shall discuss such difficult points is essential; besides that, it serves also to connect the studies of art and literature. In some branches of archaeology—such, for example, as the study of gems or engraved stones—the number of recent imitations is greater than that of the really ancient remains, and this unfortunately in proportion to their beauty and excellence; so that archaeologists are accustomed to look with great scrutiny and suspicion at these works of ancient art. Nor are there present in these objects those criteria which, as in the instance of coins, aid to determine the authenticity of the particular object under consideration. The philological enquirer often, on the other hand, renders equal aid to the archaeologist by determining the relative age of different objects of antiquity. A section of the Congress is devoted to Ethnology—that is, the consideration of the present actual condition of the different races of the East—just as archaeology considers their past civilisation. Ethnology is intimately connected with another branch of enquiry—viz., Anthropology, which is limited to the relative physical conditions of the races of men. In the Ethnological section those subjects will be considered which do not belong to the province of philology or archaeology. They are all most intimately connected. In fact, a knowledge of ethnography is essential to the study of archaeology, just as in the natural sciences the intimate acquaintance with living species, fauna, and flora, is essential to the due comprehension of extinct races of animals. Many obscure points in archaeology are cleared up by ethnological studies, which teach what is going on at the present day among peoples not more highly advanced in civilisation than the predecessors of the most highly civilised races at the most remote periods to which archaeology can point as the most hoary historical ages. In the consideration of the diversities of race, ethnography also renders invaluable aid to the philological considerations which guide us in the determination of the relative periods of the oldest civilisations of the East. For language alone is not a sufficient criterion for deciding a point so remote from observation and so delicate, change of language not always implying diversity of race. It is to ethnology as well as to archaeology and philology that we must look for the solution of the problems, whence came the first inhabitants of the valley of the Nile, the alluvial plains of Mesopotamia, the valleys of the Himalayas, and the banks of the Yangtze-kiang, the isles of Japan, the shores of Indo-China, with

all their internal varieties, the Ainos, the Miautsze, the natives of the Andaman Islands—in short, the general state of the question of the early immigrations which were made before history was written, or tradition definitely handed down. Some of these questions will occupy the attention of the Ethnological section, and will receive ample illustration from the contributions and memoirs offered to it. Under the head of ethnology have been classed the science and the products, natural and artificial, of the East. The glyphic and graphic arts have indeed been assigned to the Archaeological section; but the arms, natural weapons, the manufactures, the products of human ingenuity in any shape are portions of the study of Ethnology, and as such will be considered under that department. The development of the so-called Stone and Bronze ages of the East, their contributions to the general knowledge of the conditions of the first inhabitants of the globe, are particularly interesting to all enquirers, when it is borne in mind that the cradle of mankind has, by universal consent and uniform tradition, supported by direct historic proofs, always been placed in the East, and that the early European races emerged subsequently from an originally uncivilized condition. These younger children of time derived the first elements of their civilization from contact with the East, then, relatively, far more advanced, placed under more favourable circumstances, and surrounded by those productions of nature which have ever contributed to the comfort, luxury, and refinement of mankind, and to the development of the arts and sciences. These natural products it is impossible to do more than allude to, they are so numerous—valuable metals, precious woods, gums, spices, the teeth of animals, the ivory of the hippopotamus and the elephant, the nutritive fruits almost superseding the necessity of the cultivation of grain. The thousands of products of the animal, vegetable, and mineral kingdoms have at all times directed the attention of the West to the East, just as in the East itself they have called forth some of the greatest efforts of human ingenuity, and have given rise in past ages to discoveries relatively as great and important as those which, in modern Europe, cease to astonish us, simply because of their universal diffusion and daily use. All these can be made objects of enquiry, but it will be impossible in a single sitting to do more than allude to the subject, or to read such papers on these points as may be submitted to the section. In the present Congress, however, there are many present who can throw light upon whatever it may seem desirable to discuss under these several heads. There only now remains to mention the assistance rendered to Oriental studies by the universities and learned societies of Europe, who, in addition to the interest with which they have received memoirs on subjects connected with the East, have many of them sent delegates and representatives to the present Congress. In this country the Royal Asiatic Society has generally encouraged the advance of Oriental learning, especially the Aryan and Turanian sections. The Royal Society of Literature has also, besides Greek and Roman antiquities, promoted the study of Egyptian hieroglyphs. The new Society of Biblical Archaeology has also, though last, entered with the greatest interest on the route of Semitic and Hamitic languages, as well as the archaeology of lands connected with the Bible. In order to bring this knowledge before all classes of the public by the publication of the *Records of the Past*, and in order to revive the study of Oriental learning, it has proposed a series of lectures on Assyrian and Egyptian philology. The *Journal Asiatique* in France, and that of the German Oriental Society at Leipsic, are the known organs of all Oriental languages in those countries, and the special sections of Egyptian and Assyrian have been well represented in the *Zeitschrift für Aegyptische Sprache und Alterthumskunde* of Berlin. It is to be hoped that all these exertions will not have been in vain, and that this Congress,

demonstrating the growing importance of Oriental studies, will attract fresh enquiries to these studies, and such as will sustain hereafter the brilliant reputation achieved by those now present in the pursuit. Nor can this address be closed without asking you to join with me in an expression of our thanks for the countenance afforded to this Congress and this country by the Governments of Europe—by Germany, Italy, Portugal, Russia, Egypt, and others, whose enlightened rulers have sent representatives from universities and other public institutions.

TUESDAY, September 15.

The morning of this day was occupied with a visit to the British Museum. At 2.30 P.M. took place the meeting of the

SEMITIC SECTION.

The rooms of the Royal Society of Literature, the appointed meeting-place of the Semitic section, having proved too small for the large numbers who had been attracted by the promise of several interesting papers, the section adjourned to the Royal Institution; and there the President, Sir H. Rawlinson, recommenced his half-finished address. Sir Henry Rawlinson said:—

The section of the Congress which I have now the honour to address has been organised for the purpose of giving to Orientalists an opportunity of interchanging their ideas with regard to that group of languages to which the conventional name has been given of Semitic. This group has always possessed an interest beyond, and independently of, its linguistic peculiarities, in consequence of its having been the medium, to use the words of Dr. Pritchard, “of handing down and perpetuating the dictates of divine revelation.” Semitic studies, indeed, have been cultivated in all ages mainly from their connexion with the Hebrew Scriptures, and even now discoveries in this field of research are chiefly valued by the public from the light which they throw on the Mosaic account of the early history of mankind. The Congress of Orientalists, however, will probably attach more importance to philological than to historical or religious considerations, and will be disposed to discuss Semitic literature and the Semitic languages in their general rather than their special relations. The time is hardly yet come, perhaps, for sound generalization in regard to the origin, development, and scientific classification of the Semitic languages. At any rate I have not the requisite knowledge or leisure to grapple with such a question. All that I propose to do in opening this section is to draw attention to the very enlarged proportions that have lately been given to Semitic research. Not only have our Phœnician materials been more than doubled since Gesenius wrote his famous text-book on the relics of that language, but Southern Arabia has yielded a mass of inscriptions from copper plates and sculptured rocks, which have brought the old Himyaritic language fairly within our grasp, and more recently Assyria has been added to the list, sustained enquiry having opened up to the investigation of scholars that ancient language, which, as far as our present knowledge extends, would seem to be one of the earliest members of the widespread Semitic family. Educated Europe was very slow to admit the genuineness of cuneiform decipherment. It was asserted at first as a well-known axiom, that it was impossible to recover lost alphabets and extinct languages without the aid of a bilingual key, such as was afforded to Egyptologists by the famous Stone of Rosetta. Our efforts at interpretation were therefore pronounced to be empirical, and scholars were warned against accepting our results. I have a vivid recollection, indeed, of the scornful incredulity with which I was generally received when, in 1849, I first brought to England a copy of the Babylonian version of the Behistun Inscription, and endeavoured to show that by comparing this

version with the corresponding Persian text I had arrived at a partial understanding of the newly discovered records of Assyria and Babylonia. I did not assume to have done more than break the crust of the difficulty, and yet I obtained no attention. Hardly anyone in England, except Dr. Hincks and Mr. Norris and the Chevalier Bunsen, was satisfied of the soundness of the basis of the enquiry. Nor, indeed, did the study make much progress for a long time afterwards. Semitic scholars, like M. Renan, accustomed to the rigid forms and limited scope of alphabets of the Phœnician type, were bewildered at the laxity of cuneiform expression, where phonetic and ideographic elements were commingled, and refused to admit the possibility of such a system of writing being applied to a Semitic language. Biblical students, again, were not favourable at first to the idea of testing the authenticity of the Hebrew annals by comparing them with the contemporary annals of a cognate people, and for a time ignored our results; while the Classicists of this country, who followed the lead of the late Sir George Cornewall Lewis, calmly asserted the superiority and sufficiency of Greek tradition, and treated our endeavours to set up a rival school of historical criticism, derived from a barbarian source, almost with contempt. Struggling thus against disbelief and prejudice, our progress in this country was for many years slow and unsatisfactory; but at length, as materials increased, and competing intellects, engaged in the study of the inscriptions, arrived at almost identical results, the attention of Europe was aroused, and Assyriologists received a more respectful treatment.

It would be out of place on an occasion like the present to trace in any detail the early stages of cuneiform decipherment, or to attempt to apportion among the first pioneers in this difficult branch of study their respective shares in the credit of discovery. Still there are some names, both among the living and the dead, to which, even in this hasty sketch, I cannot help referring. The obligations which Assyriologists owe to the late Dr. Hincks and the late Mr. Norris can hardly be overstated, while there is still one among us who, if he did not commence work quite so early as his English fellow-labourers, carried on his researches with an energy, a perseverance, and a happy boldness which soon enabled him to outstrip them. I allude to Dr. Jules Oppert, of Paris. If any one has a right to claim the paternity of Assyrian science as it exists at the present day, it is certainly this distinguished scholar, who, having enjoyed the advantage of a personal investigation of the Assyrian and Babylonian ruins, now twenty-three years ago, devoted himself on his return to Europe to the prosecution of cuneiform studies with a vigour and ingenuity, neither deterred by opposition nor discouraged by neglect, which ultimately led to a complete success, gaining as he did for himself the Quinquennial Prize of the French Academy, and thus obtaining the attestation of the first critical body in Europe to the genuineness and importance of the studies in which he was engaged. This, indeed, may be considered the turning-point of cuneiform research; hitherto there had been doubt and disparagement; henceforward Assyriology took its place within the recognised pale of Oriental science, and the study of the inscriptions steadily advanced. France well sustained her claim to the prominent place which Dr. Oppert had first acquired for her. M. Ménant, who was at an early period associated with him, exerted himself to popularise a difficult subject; while the indefatigable François Lenormant, following closely on their footsteps, has since pursued a brilliant career of discovery and daring research, which in his particular line of study has placed him far ahead of all competitors. Waldeemar Schmidt in Denmark, Finzi in Italy, and Naville of Geneva, have also joined our band of Assyriologists, while Germany, although coming late into the field of Assyriology, has at once

assumed a leading position in regard to the most essential branch of the enquiry, from which she is not likely to be soon displaced. It is, indeed, a searching and elaborate critical power, combined with intense application and a thorough mastery of the Semitic languages, rather than conjectural translation, however happy, or premature generalisation, which is too apt to mislead, that is now required for the advancement of Assyrian knowledge; and as such qualifications are pre-eminently possessed by Professor Schrader and Dr. Praetorius, who are at the head of the cuneiform scholars of Germany, I am inclined to look to them as our future leaders in this interesting study. The contribution of England of late years to the science of Assyrian philology has perhaps hardly kept pace with its early promise. Mr. Norris's Dictionary and the three volumes of Inscriptions which I have published for the British Museum have supplied, no doubt, very useful and extensive materials for scholars to work upon, while the independent labours of Mr. George Smith, of Mr. Fox Talbot, and of the Rev. Mr. Sayce have thrown much light on the history and geography and half-developed science of the Assyrians, as well as on their mythology, and especially on their primitive legends and traditions; but, notwithstanding the wide extent of these researches and their great merit, as additions to our knowledge of the early world, I am bound to say that nothing has lately appeared in this country which, in my opinion, is equal in value, in a philological point of view, to the researches of Schrader and Oppert; and I am further inclined to think that until some accomplished Semitic scholar, such as the late Dr. Lee or the late Dr. Cureton, shall take up cuneiform enquiry in England and devote himself exclusively to it, we must be content, as far as critical accuracy is concerned, to follow in the wake of our Continental brethren. At the same time, I am far from wishing to disparage the labours of the English school of Assyriology or to deter young disciples from joining our ranks. What I complain of is—and I am fully as culpable as my fellow-labourers in this matter—that we have hitherto devoted ourselves to the sensational rather than the practical branch of the enquiry, and have thus built up a superstructure on insecure foundations. Historical discovery and the illustration of obscure points of ethnology and chronology are no doubt more attractive studies than dry disquisitions on grammar and etymology, more attractive in their nature, and more likely to command the attention of the public; but the dry studies, nevertheless, are, or ought to be, a necessary preliminary to the others, whose very attractiveness, indeed, is almost in an inverse ratio to their philological value. While I congratulate, therefore, Mr. George Smith on his great achievements in recovering the lost history of early Babylon, in bringing to light the primitive traditions which the Babylonians held, in common with the Hebrew colonists who migrated from Chaldaea to Palestine, in fixing by means of Assyrian records the chronology of Western Asia, and giving, for the first time, a consistent and continuous account of the Assyrian Empire; and while I also congratulate Mr. Sayce on the general accuracy of his readings, and especially on his success in partially explaining the astronomy and astrology of the early Chaldeans, I do most earnestly recommend both of these scholars to pay more attention in future to the rudiments of the study than to its higher branches. It would be desirable, I think, in all future publications, to accompany the translation of every sentence with its grammatical and etymological analysis, especial care being taken to compare the corresponding roots and inflections in the cognate languages, not at random or from a fancied resemblance of sound, but according to the established rules of euphony and grammatical change. As matters stand at present, we are far from having overcome the elementary difficulties of phonetic representation.

Notwithstanding, indeed, the numerous alphabets and syllabaries that have been published, there are still many cuneiform characters of doubtful power, while the vernacular names of the gods, which enter so largely into the composition of Babylonian and Assyrian proper names, and are thus essential to historical identification, are for the most part rendered conventionally and provisionally. For my own part, I should hail the determinate reading of these names, a result, which in default of direct evidence can only be obtained by a very large and laborious induction, as a more substantial advance in Assyriology than the discovery of a new dynasty of kings or the complete explanation of the whole series of astronomical tables. Let me, then, impress upon all young Semitic scholars who desire to take up the study of the cuneiform inscriptions to begin at the beginning, to learn thoroughly the alphabet and grammar of the Assyrian language before they attempt independent translation, and only gradually to ascend into those higher regions of enquiry which will be brought before the section by the experienced scholars around me. In the meantime we are doing good service in this country to the common cause in accumulating materials. Mr. George Smith, during his last two visits to Assyria, has added several thousand fragments of tablets and cylinders to the already large collection deposited in the British Museum; and our fourth volume of the Cuneiform Inscriptions of Western Asia is now on the eve of publication. It is a satisfactory proof of the high place which Assyriology has now taken in the estimation of Semitic scholars that the communications which are prescribed for our section are all, with one exception, connected with the study of the cuneiform inscriptions; and, indeed, as I make no pretension myself to any extensive or critical knowledge of the Semitic languages, it can only be to my early connexion with the cuneiform decipherment and the interest which I have ever taken in the subject that I am indebted for the high honour of being called to preside over this section. I now declare the section to be open, and invite the members to proceed to business."

A large part of the afternoon having been consumed by M. Oppert's speeches and preliminary compliments to the President, the latter ruled that no time was left for hearing the papers of Professor Schrader and Mr. Geldart, and they were accordingly taken as read. As, however, they will probably be of more interest to members of this section than discussions upon Turanian and mathematical subjects, we subjoin abstracts of both:—

M. Jules Oppert first spoke on the Turanian character of the second language of the Persian inscriptions. This had been pointed out long ago by Westergaard, and more especially by Norris; and though the language itself is not Semitic, its being written in cuneiform characters ought, the speaker urged, to allow of its being brought before a Semitic section. He maintained that the true title of the idiom was Median and not Scythic, and that the Median dynasty of Ctesias is not a list of fictitious kings, but the Aryan translations of such "Median" names as Deioeces (= Artaios), Arseuggi (= Aspadas), etc. He then turned to the subject of Assyrian chronology, which he believed to be based on a Babylonian cycle of 1,805 years, called "the period of the Moon-god." One of these periods ended in 712 B.C., in the reign of Sargon, 1,805 years back from that time giving the date of the commencement of authentic Babylonian history (2517 B.C.), and by a skilful manipulation of numbers it might be shown that the Babylonian cycle had the same starting-point as the Sothiac cycle of Egypt.

Baron Textor de Ravisi then endeavoured to assert the claims of the Berber dialects to rank as Semitic, but it was decided by the President that the consideration of this subject did not properly fall within the scope of the section.

Professor Schrader's paper related to the Transliteration of the Characters of the Assyrian Syllabary into Roman Letters, in which he advocated a common system of transliteration in place of the variety which at present exists. The chief points upon which he insisted were the exclusion of double letters, the use of diacritical points, and the transcription of *ayin* by *y* instead of *e*, as now customary.

The most important paper of the day was one on "Dr. Hincks's Permissive Tense in the Assyrian Verb, with special reference to the First Person Singular Termination in *-cu*," by the Rev. G. C. Geldart. The true grammatical character of the Assyrian forms in *-acu* has been a subject of considerable controversy among students of the language, one side maintaining their verbal, and the other their substantival character. The author discussed the question from the point of view of general comparative philology, taking those words only the reading and meaning of which are agreed upon by all Assyriologists. After showing that this affirmative *acu* or *ac* was the first personal pronoun which appears in *anacu*, "I," and tracing agglutinative forms in which a personal pronoun is attached to a substantive or a participle through Aramaic, Syriac, and Hebrew itself, he concluded that both sides in the controversy were in the right. On the one hand, *ristanacu*, "I am chief," is clearly substantival; on the other, *acala dapsacu* just as clearly verbal. In certain instances, the Assyrian forms in *-acu* cannot be distinguished from the perfects of the best-known Semitic languages, and the first person of the Aethiopic perfect has the same form as the Assyrian. The latter language, therefore, admits us to no less interesting a spectacle than the growth of a tense, the first person of which was formed by the suffix *acu*; which, though subsequently restricted to verbal bases only, was during the whole Assyrio-Babylonian period capable of attaching itself indifferently to these, to substantival, to adjectival, and, in fact, to all inflectional bases; and only fortuitously became limited to the verbal use which we find in Aethiopic and in the corresponding perfects of the other Semitic tongues.

WEDNESDAY, September 16.

A large party this morning went over to Wimbledon to breakfast with Sir Birtle Frere, and the afternoon was occupied by a visit to Kew Gardens.

At 8.30 P.M. at King's College met the

TURANIAN SECTION.

The President, Sir Walter Elliot, having stated that the shortness of the time at the disposal of the section, and the number of papers to be read prevented anything more than an abstract of each from being given, set an example by not delivering his address, but calling upon Professor Hunfalvy to describe the contents of his communication.

"On the Study of Turanian Languages," by Professor Hunfalvy. It was shown by numerous lexical, grammatical and phonological facts adduced from the Hungarian, Vogul, Ostiak, and Finnish languages, that the current notion of a Turanian family of speech, viz., that it is characterised by "the absence of that close family likeness which holds the Aryan and Semitic languages together," is ill founded, and that by the accepted maxim of *morphological* similarity alone it leads the student into many errors. The author, therefore, endeavoured to point out that the same *genealogical* method which has created Aryan and Semitic linguistic science, must be applied to the Turanian languages also, and that before such a complete science can be had, every comparative study of them must be unavailing.

"The Relations between Accadian and Etruscan," by the Rev. Isaac Taylor. The objection to a comparison of Etruscan with modern Altaic dialects on the ground of the great interval of time between them, may be obviated, the author urged,

by a reference to the newly-discovered Accadian language of ancient Babylonia. The two languages were accordingly compared in respect of grammar, mythology, vocabulary and ethnic character.

"The State of the Chinese Language at the time of the Invention of Writing," by the Rev. J. Edkins. This paper was divided into five parts, beginning with:—1. A discussion as to the date to which the invention of Chinese writing must be assigned, which is as early as 2300 B.C. according to the opinion of the Chinese themselves. 2. The phonetic changes undergone by the language during the last 1200 years were next examined and deduced from a comparison of Hindu proper names found in the works of Chinese Buddhist pilgrims, with their Sanskrit originals. 3. Another period of 1200 years takes us back to the period of Confucius and the era of the old Chinese poetry recently translated by Dr. Legge. These were in the vernacular of the time; and as they are in rhyme, like other Chinese poetical productions, it is possible to determine some of the phonetic peculiarities of the language at that date. 4. The Chinese characters are an index to the sound of the words at the time of their invention, since a large number of them, besides being employed as ideographs, were also used as mere signs of sound. Thus, as *bak* signified "white," and *pak* "cypress" and "soul," the symbol of "whiteness" expressed also both "cypress" and "soul" when accompanied by the determinatives of "wood" and "spirit." By this means the ancient language has been, as it were, photographed, and the great changes undergone by it have been laid open to view. Among phonetic changes thus revealed may be mentioned the change of final *m* into *ng*, and the branching off of an initial dental into *s* (*sh*) on the one side, and *l* on the other. 5. But these characters are also an index to the nature and extent of the vocabulary then in use, and a measure of the civilisation already obtained. Not only were the Chinese shown to be acquainted with decimal arithmetic, weights and measures, gold, silver, iron, and other common metals, weaving, boating, agriculture, carpentry, and house-building, but also with an elevated moral and political system.

In the course of the discussion, in which Dr. Birch and Dr. Legge took part, Mr. Edkins stated his belief that the Chinese tones replace lost alphabetic elements, and that the introduction of a new tone requires about 1,200 years.

The Rev. Samuel Beal then gave an abstract of his paper on the "Result of the Examination of some Chinese Buddhist Books in the Library of the India Office," in which he expounded the distinctive marks belonging to the Northern School of Buddhism. This was followed by a consideration of the *Samā Jataka*, and its relation to the episode in the *Kāya yāna*. The paper concluded with a comparison of the Chinese version of the *Chatur Dharmaka* with that of M. Léon Feer from the Thibetan.

THURSDAY, September 17.

This morning was employed by the members in visiting the Library of the India Office and the Soane Museum. At 2.30 P.M., in the Theatre of the Royal Institution, assembled the

ARYAN SECTION.

ADDRESS OF PROFESSOR MAX MÜLLER, PRESIDENT.

No one likes to be asked what business he has to exist, and yet, whatever we do, whether singly or in concert with others, the first question which the world never fails to address us is, *Dieu cur hic?* Why are you here? or to put it into French, What is your *raison d'être*? We have had to submit to this examination even before we existed, and many a time have I been asked the question, both by friend and foe, What is the good of an International Congress of Orientalists?

I shall endeavour, as shortly as possible, to answer that question, and show that our Congress is not a mere fortuitous congeries of barren atoms

or molecules, but that we are at least Leibnizian monads, each with his own self, and force, and will, and each determined, within the limits of some pre-established harmony, to help in working out some common purpose, and to achieve some real and lasting good.

It is generally thought that the chief object of a scientific Congress is social, and I am not one of those who are incapable of appreciating the delights and benefits of social intercourse with hard-working and honest-thinking men. Much as I detest what is commonly called society, I willingly give up glaciers and waterfalls, cathedrals and picture galleries, for one half-hour of real society, of free, frank, fresh, and friendly intercourse, face to face, and mind to mind, with a great and noble and loving soul, such as was Bunsen; with a man intrepid in his thoughts, his words, and his deeds, such as was John Stuart Mill; or with a scholar who, whether he had been quarrying heavy blocks, or chiselling the most brittle filigree work, poured out all his treasures before you with the pride and pleasure of a child, such as was Eugène Burnouf. A Congress therefore, and particularly an International Congress, would certainly seem to answer some worthy purpose, were it only by bringing together fellow-workers of all countries and ages, by changing what were to us merely great names into pleasant companions, and by satisfying that very right and rational curiosity which we all feel after having read a really good book, of seeing what the man looks like who could achieve such triumphs.

All this is perfectly true; yet, however pleasant to ourselves this social intercourse may appear, in the eyes of the world at large it will hardly be considered a sufficient excuse for our existence. In order, therefore, to satisfy that outer world that we are really doing something, we point of course to the papers which are read at our public meetings, and to the discussions which they elicit. Much as I value that feature also in a scientific congress, I confess I doubt, and I know that many share that doubt, whether the same result might not be attained with much less trouble. A paper that contains something really new and valuable, the result, it may be, of years of toil and thought, requires to be read with care in a quiet corner of our own study, before the expression of our assent or dissent can be of any weight or value. There is too much hollow praise, and occasionally too much wrangling and ill-natured abuse at our scientific tournaments, and the world at large, which is never without a tinge of malice and a vein of quiet humour, has frequently expressed its concern at the waste of "oil and vinegar" which is occasioned by the frequent meetings of our British and Foreign Associations.

What then is the real use of a Congress, such as that which has brought us together this week from all parts of the world? What is the real excuse for our existence? Why are we here, and not in our workshops?

It seems to me that the real and permanent use of these scientific gatherings is twofold.

(1) They enable us to take stock, to compare notes, to see where we are, and to find out where we ought to be going.

(2) They give us an opportunity, from time to time, to tell the world where we are, what we have been doing for the world, and what, in return, we expect the world to do for us.

The danger of all scientific work at present, not only among Oriental scholars, but, as far as I can see, everywhere, is the tendency to extreme specialisation. Our age shows in that respect a decided reaction against the spirit of a former age, which those with grey heads among us can still remember, an age represented in Germany by such names as Humboldt, Ritter, Böckh, Johannes Müller, Bopp, Bunsen, and others; men who look to us like giants, carrying a weight of knowledge far too heavy for the shoulders of such mortals as now be; ay, men who were giants, but whose chief strength con-

sisted in this, that they were never entirely absorbed or bewildered by special researches, but kept their eye steadily on the highest objects of all human knowledge; who could trace the vast outlines of the kosmos of nature or the kosmos of the mind with an unwavering hand, and to whose maps and guide books we must still recur, whenever we are in danger of losing our way in the mazes of minute research. At the present moment such works as Humboldt's *Kosmos*, or Bopp's *Comparative Grammar*, or Bunsen's *Christianity and Mankind*, would be impossible. No one would dare to write them, for fear of not knowing the exact depth at which the *Protophones Hæckelii* has lately been discovered, or the lengthening of a vowel in the *Sanhitapāṭha* of the Rig-Veda. It is quite right that this should be so, at least for a time; but all rivers, all brooks, all rills, are meant to flow into the ocean, and all special knowledge, to keep it from stagnation, must have an outlet into the general knowledge of the world. Knowledge for its own sake, as it is sometimes called, is the most dangerous idol that a student can worship. We despise the miser who amasses money for the sake of money; but still more contemptible is the intellectual miser who hoards up knowledge instead of spending it, though, with regard to most of our knowledge, we may be well assured and satisfied that, as we brought nothing into the world, so we may carry nothing out.

Against this danger of mistaking the means for the end, of making bricks without making mortar, of working for ourselves instead of working for others, meetings such as our own, bringing together so large a number of the first Oriental scholars of Europe, seem to me a most excellent safeguard. They draw us out of our studies away from our common routine, away from that small orbit of thought in which each of us moves day after day, and make us realise more fully that there are other stars moving all around us in our little universe, that we all belong to one celestial system, or to one terrestrial commonwealth, and that, if we want to see real progress made in that work with which we are more specially entrusted, the re-conquest of the Eastern world, we must work with one another, for one another, like members of one body, like soldiers of one army, guided by common principles, striving after common purposes, and sustained by common sympathies. Oriental literature is of such enormous dimensions that our small army of scholars can occupy certain prominent positions only; but those points, like the stations of a trigonometrical survey, ought to be carefully chosen, so as to be able to work in harmony together. I hope that in that respect our Congress may prove of special benefit. We shall hear, each of us, from others, what they wish us to do. "Why don't you finish this?" "Why don't you publish that?" are questions which we have already heard asked by many of our friends. We shall be able to avoid what happens so often, that two men collect materials for exactly the same work, and we may possibly hear of some combined effort to carry out great works, which can only be carried out *viribus unitis*, and of which I may at least mention one, a translation of the *Sacred Books of Mankind*. Important progress has already been made for setting on foot this great undertaking, an undertaking which I think the world has a right to demand from Oriental scholars, but which can only be carried out by joint action. This Congress has helped us to lay the foundation-stone, and I trust that at our next Congress we shall be able to produce some tangible results.

I now come to the second point. A Congress enables us to tell the world what we have been doing. This, it seems to me, is particularly needful with regard to Oriental studies, which, with the exception of Hebrew, stand still outside the pale of our schools and universities, and are cultivated by the very smallest number of students. And yet, I make bold to say, that during the last hundred, and still more during the last fifty years, Oriental

studies have contributed more than any other branch of scientific research to change, to purify, to clear, and intensify the intellectual atmosphere of Europe, and to widen our horizon in all that pertains to the Science of Man, in history, philology, theology, and philosophy. We have not only conquered and annexed new worlds to the ancient empire of learning, but we have leavened the old world with ideas that are already fermenting even in the daily bread of our schools and universities. Most of those here present know that I am not exaggerating; but as the world is sceptical while listening to orations *pro domo*, I shall attempt to make good my assertions.

At first, the study of Oriental literature was a matter of curiosity only, and it is so still to a great extent, particularly in England. Sir William Jones, whose name is the only one among Oriental scholars that has obtained a real popularity in England, represents most worthily that phase of Oriental studies. Read only the two volumes of his life, and they will certainly leave on your mind the distinct impression that Sir William Jones was not only a man of extensive learning and refined taste, but undoubtedly a very great man—one in a million. He was a good classical scholar of the old school, a well-read historian, a thoughtful lawyer, a clear-headed politician, and a true gentleman, in the old sense of the word. He moved in the best—I mean the most cultivated society, the great writers and thinkers of the day listened to him with respect, and say what you like, we still live by his grace, we still draw on that stock of general interest which he excited in the public mind for Eastern subjects.

Yet the interest which Sir William Jones took in Oriental literature was purely aesthetic. He chose what was beautiful in Persian and translated it, as he would translate an ode of Horace. He was charmed with Kālidāsa's play of *Sakuntala*—and who is not?—and he left us his classical reproduction of one of the finest of Eastern gems. Being a judge in India, he thought it his duty to acquaint himself with the native law-books in their original language, and he gave us his masterly translation of the Laws of Manu. Sir William Jones was fully aware of the startling similarity between Sanskrit, Latin, and Greek. More than a hundred years ago, in a letter written to Prince Adam Czartoryski, in the year 1770, he says: "Many learned investigators of antiquity are fully persuaded, that a very old and almost primeval language was in use among the northern nations, from which not only the Celtic dialect, but even Greek and Latin are derived; in fact, we find *παῖς* and *μῆτρος* in Persian, nor is *duyātro* so far removed from *dochter*, or even *duya* and *nomen* from Persian *nām*, as to make it ridiculous to suppose that they sprang from the same root. We must confess," he adds, "that these researches are very obscure and uncertain, and you will allow, not so agreeable as an ode of Hafiz, or an elegy of Amr'alkais." In a letter, dated 1787, he says: "You will be surprised at the resemblance between Sanskrit and both Greek and Latin." Colebrooke also, the great successor of Sir William Jones, was fully aware of the relationship between Sanskrit, Greek, Latin, German, and even Slavonic. I possess some curious MS. notes of his, of the year 1801 or 1802, containing long lists of words, expressive of the most essential ideas of primitive life, and which he proved to be identical in Sanskrit, Greek, Latin, German, and Slavonic. Yet neither Colebrooke nor Sir William Jones perceived the full import of these facts. Sir William Jones died young; Colebrooke's energies, marvellous as they were, were partly absorbed by official work, so that it was left to German and French scholars to bring to light the full wealth of the mine which those great English scholars had been the first to open. We know now that in language, and in all that is implied by language, India and Europe are one; but to prove this, against the incredulity of all the greatest scholars of the day, was no easy matter.

It could be done effectually in one way only, viz., by giving to Oriental studies a strictly scientific character, by requiring from Oriental students not only the devotion of an amateur, but the same thoroughness, minuteness, and critical accuracy which were long considered the exclusive property of Greek and Latin scholars. I could not think of giving here a history of the work done during the last fifty years. It has been admirably described in Benfey's *History of the Science of Language*. Even if I attempted to give merely the names of those who have been most distinguished by really original discoveries—the names of Bopp, Pott, Grimm, Burnouf, Rawlinson, Miklosich, Benfey, Kuhn, Zeuss, Whitley Stokes—I am afraid my list would be considered very incomplete.

But let us look at what has been achieved by these men, and many others who followed their banners. The East, formerly a land of dreams, of fables, and fairies, has become to us a land of unmistakeable reality; the curtain between the West and the East has been lifted, and our old forgotten home stands before us again in bright colours and definite outlines. Two worlds, separated for thousands of years, have been reunited as by a magical spell, and we feel rich in a past that may well be the pride of our noble Aryan family. We say no longer vaguely and poetically, *Ex Oriente Lux*, but we know that all the most vital elements of our knowledge and civilisation—our languages, our alphabets, our figures, our weights and measures, our art, our religion, our traditions, our very nursery stories—came to us from the East; and we must confess that but for the rays of Eastern light, whether Aryan or Semitic, or Hamitic, that called forth the hidden germs of the dark and dreary West, Europe, now the very light of the world, might have remained for ever a barren and forgotten promontory of the primeval Asiatic continent. We live, indeed, in a new world; the barrier between the West and the East, that seemed insurmountable, has vanished. The East is ours, we are its heirs, and claim by right our share in its inheritance.

We know what it was for the Northern nations, the old barbarians of Europe, to be brought into spiritual contact with Rome and Greece, and to learn that beyond the small, poor world in which they had moved, there was an older, richer, brighter world, the ancient world of Rome and Athens, with its arts and laws, its poetry and philosophy, all of which they might call their own and make their own by claiming the heritage of the past. We know how from that time the Classical and Teutonic spirits mingled together and formed that stream of modern thought on whose shores we ourselves live and move. A new stream is now being brought into the same bed, the stream of Oriental thought, and already the colours of the old stream show very clearly the influence of that new tributary. Look at any of the important works published during the last twenty years, not only on language, but on literature, mythology, law, religion, and philosophy, and you will see on every page the working of a new spirit. I do not say that the East can ever teach us new things, but it can place before us old things, and leave us to draw from them, lessons more strange and startling than anything dreamt of in our philosophy. Before all, a study of the East has taught us the same lesson which the Northern nations once learnt in Rome and Athens, that there are other worlds beside our own, that there are other religions, other mythologies, other laws, and that the history of philosophy from Thales to Hegel is not the whole history of human thought. In all these subjects the East has supplied us with parallels, and with all that is implied in parallels, viz. the possibility of comparing, measuring, and understanding. The comparative spirit is the truly scientific spirit of our age, nay of all ages. An empirical acquaintance with single facts does not constitute knowledge in the true sense of the word. All human knowledge begins with the Two or the Dyad, the

comprehension of two single things as one. If we may still quote Aristotle, we may boldly say that "there is no science of that which is unique." A single event may be purely accidental, it comes and goes, it is inexplicable, it does not call for an explanation. But as soon as the same fact is repeated, the work of comparison begins, and the first step is made in that wonderful process which we call generalisation, and which is at the root of all intellectual knowledge and of all intellectual language. This primitive process of comparison is repeated again and again, and when we now give the title of *Comparative* to the highest kind of knowledge in every branch of science, we have only replaced the old word *intelligent* (i.e. interligent) or inter-twining, by a new and more expressive term, *comparative*. I shall say nothing about the complete revolution of the study of languages by means of the comparative method, for here I can appeal to such names as Mommsen and Curtius, to show that the best among classical scholars are themselves the most ready to acknowledge the importance of the results obtained by the intertwining of Eastern and Western studies. But take mythology. As long as we had only the mythology of the classical nations to deal with, we looked upon it simply as strange, anomalous, and irrational. When, however, the same strange stories, the same hallucinations, turned up in the most ancient mythology of India, when not only the character and achievements, but the very names of some of the gods and heroes were found to the same, then every thoughtful observer saw that there must be a system in that ancient madness, that there must be a meaning in that strange mob of gods and heroes, and that it must be the task of comparative mythology to find out what reason there is in all that mass of unreason.

The same comparative method has been applied to the study of religion also. All religions are Oriental, and with the exception of the Christian, their sacred books are all written in Oriental languages. The materials, therefore, for a comparative study of the religious systems of the world had all to be supplied by Oriental scholars. But far more important than those materials, is the spirit in which they have been treated. The sacred books of the principal religions of mankind had to be placed side by side with perfect impartiality, in order to discern the points which they shared in common as well as those that are peculiar to each. The results already obtained by this simple juxtaposition are full of important lessons, and the fact that the truths on which all religions agree far exceed those on which they differ, has hardly been sufficiently appreciated. I feel convinced, however, that the time will come when those who at present profess to be most disquieted by our studies will be the most grateful for our support; for having shown by evidence which cannot be controverted, that all religions spring from the same sacred soil, the human heart; that all are quickened by the same divine spirit, the still small voice; and that, though the outward forms of religion may change, may wither and decay, yet, as long as man is what he is and what he has been, he will postulate again and again the Infinite as the very condition of the Finite; he will yearn for something which the world cannot give; he will feel his weakness and dependence, and in that weakness and dependence discover the deepest sources of his hope, and trust, and strength.

A patient study of the sacred scriptures of the world is what is wanted at present, more than anything else, in order to clear our own ideas of the origin, the nature, the purposes of religion. There can be no science of one religion, but there can be a science of many. We have learnt already one lesson, that behind the helpless expressions which language has devised, whether in the East or in the West, for uttering the unutterable, be it *Dyaushpitā* or *Ahuramazda*, be it *Jehovah* or *Allah*, be it the All or the Nothing, be it the First

Cause or Our Father in heaven, there is the same intention, the same striving, the same stammering, the same faith. Other lessons will follow, till in the end we shall be able to restore that ancient bond which unites not only the East with the West, but all the members of the human family, and may learn to understand what a Persian poet meant when he wrote many centuries ago—I quote from Mr. Conway's *Sacred Anthology*—"Diversity of worship has divided the human race into seventy-two nations. From among all their dogmas I have selected one—the love of God."

Nor is this comparative spirit restricted to the treatment of language, mythology, and religion. While hitherto we knew the origin and spreading of most of the ancient arts and sciences in one channel only, and had to be satisfied with tracing their sources to Greece and Rome, and thence down the main stream of European civilisation, we have now for many of them one or two parallel histories in India and China. The history of geometry, for instance—the first formation of geometrical conceptions or technical terms—was hitherto known to us from Greece only: now we can compare the gradual elaboration of geometrical principles both in Greece and India, and thus arrive at some idea of what is natural or inevitable, and what is accidental or purely personal in each. It was known, for instance, that in Greece the calculation of solid figures began with the building of altars, and you will hear to-day from Dr. Thibaut, that in India also the first impulse to geometric science was given, not by the measuring of fields, as the name implies, but by the minute observances in building altars.

Similar coincidences and divergences have been brought to light by a comparative study of the history of astronomy, of music, of grammar, but, most of all, by a comparative study of philosophic thought. There are, indeed, few problems in philosophy which have not occupied the Indian mind; and nothing can exceed the interest of watching the Hindu and the Greek working on the same problems, each in his own way, yet both in the end arriving at much the same results. Such are the coincidences between the two, that but lately an eminent German professor* published a treatise to show that the Greeks had borrowed their philosophy from India, while others lean to the opinion that in philosophy the Hindus are the pupils of the Greeks. This is the same feeling which impelled Dugald Stewart, when he saw the striking similarity between Greek and Sanskrit, to maintain that Sanskrit must have been put together after the model of Greek and Latin by those arch-forgers and liars, the Brahmins, and that the whole of Sanskrit literature was an imposition. The comparative method has put an end to such violent theories. It teaches us that what is possible in one country is possible also in another; it shows us that, as there are antecedents for Plato and Aristotle in Greece, there are antecedents for the Vedānta and Sāṅkhya philosophies in India, and that each had its own independent growth. It is true, that when we first meet in Indian philosophy with our old friends, the four or five elements, the atoms, our metaphysics, our logic, our syllogism, we are startled; but we soon discover that, given the human mind and human language, and the world by which we are surrounded, the different systems of philosophy of Thales and Hegel, of Vyāsa and Kapila, are inevitable solutions. They all come and go, they are maintained and refuted, till at last all philosophy ends where it ought to begin, with an enquiry into the necessary conditions and the inevitable forms of knowledge, represented by a criticism of Pure Reason, and by a criticism of Language.

Much has been done of late for Indian philosophy, particularly by Ballantyne and Hall, by Cowell and Gough, and by the editors of the *Bibliotheca Indica* and the *Pandit*. Yet it is

* *Aristotle's Metaphysik, eine Tochter der Sāṅkhya-Lehre des Kapila*. Von Dr. C. B. Schlüter. 1874.

much to be desired that some young scholars well versed in the history of European philosophy should devote themselves to this promising branch of Indian literature. No doubt they would find it a great help if they were able to spend some years in India, in order to learn from the last and fast disappearing representatives of some of the old schools of Indian philosophy what they alone can teach. What can be done by such a combination of Eastern and Western knowledge has lately been shown by the excellent work done by Dr. Kielhorn, the Professor of Sanskrit at the Deccan College in Poona. But there is now so much of published materials, and Sanskrit MSS. also are so easily obtainable from India, that much might be done in England, or in France, or in Germany—much that would be of interest not only to Oriental scholars, but to all philosophers whose powers of independent appreciation are not entirely blunted by their study of Plato and Aristotle, of Berkeley, Hume, and Kant.

We have so far dwelt chiefly on the powerful influence which the East, and more particularly India, have exercised on the intellectual life and work of the West. But the progress of Oriental scholarship in Europe, and the discovery of that spiritual relationship which binds India and England together, has likewise produced practical effects of the greatest moment in the East. The Hindus, in their first intercourse with English scholars, placed before them the treasures of their native literature with all the natural pride of a nation that considered itself the oldest, the wisest, the most enlightened nation in the world. For a time, but for a short time only, the claims of their literature to a fabulous antiquity were admitted, and dazzled by the unexpected discovery of a new classical literature, people raved about the beauty of Sanskrit poetry in truly Oriental strains. Then followed a sudden reaction, and the natives themselves, on becoming more and more acquainted with European history and literature, began to feel the childishness of their claims, and to be almost ashamed of their own classics. This was a national misfortune. A people that can feel no pride in the past, in its history and literature, loses the mainstay of its national character. When Germany was in the very depth of its political degradation, it turned to its ancient literature, and drew hope for the future from the study of the past. Something of the same kind is now passing in India. A new taste, not without some political ingredients, has sprung up for the ancient literature of the country; a more intelligent appreciation of their real merits has taken the place of the extravagant admiration for the masterworks of their old poets; there is a revival in the study of Sanskrit, a surprising activity in the republication of Sanskrit texts, and there are traces among the Hindus of a growing feeling, not very different from that which Tacitus described, when he said of the Germans: "Who would go to Germany, a country without natural beauty, with a wretched climate, miserable to cultivate or to look at—*unless it be his fatherland!*"

Even the discovery that Sanskrit, English, Greek, and Latin are cognate languages, has not been without its influence on the scholars and thinkers, on the leaders of public opinion, in India. They, more than others, had felt for a time most keenly the intellectual superiority of the West, and they rose again in their own estimation by learning that, physically or, at all events, intellectually, they had been and might be again, the peers of Greeks and Romans and Saxons. These silent influences often escape the eye of the politician and the historian, but at critical moments they decide the fate of whole nations and empires.

The intellectual life of India at the present moment is full of interesting problems. It is too much the fashion to look only at its darker sides, and to forget that such intellectual regenerations as we are now witnessing in India are impossible

without convulsions and failures. A new race of men is growing up in India, who have stepped, as it were, over a thousand years, and have entered at once on the intellectual inheritance of Europe. They carry off prizes at English schools, take their degrees in English Universities, and are in every respect our equals. They have temptations which we have not, and now and then they succumb: but we too have temptations of our own, and we do not always resist. One can hardly trust one's eyes in reading their writings, whether in English or Bengali, many of which would reflect credit on our own Quarterlies. With regard to what is of the greatest interest to us, their scholarship, it is true that the old school of Sanskrit scholars is dying out, and much will die with it which we shall never recover; but a new and most promising school of Sanskrit students, educated by European professors, is springing up, and they will—nay, to judge from recent controversies, they have already—become most formidable rivals to our own scholars. The essays of Dr. Bhao Daji, who has lately died, on disputed points in Indian archaeology and literature, are most valuable. The indefatigable Rajendra Lal Mitra is rendering most excellent service in the publications of the Asiatic Society at Calcutta, and he discusses the theories of European Orientalists with all the ease and grace of an English reviewer. The Rājah of Besmah, Giriprasāda-sinha, has just finished his magnificent edition of the *White Yajur-veda*. The Sanskrit books published at Calcutta by Tārānātha and others form a complete library, and Tārānātha's new Dictionary of the Sanskrit language will prove most useful and valuable. The editions of Sanskrit texts published at Bombay by Professor Bhāṇḍārkar, Shankar Pandurang Pandit, and others, need not fear comparison with the best work of European scholars. There is a school of native students at Benares whose publications, under the auspices of Mr. Griffith, have made their journal, the *Pandit*, indispensable to every Sanskrit scholar. Rājārāmaśāstri's and Bālasāstri's edition of the *Mahābhāshya* has received the highest praise from European students. In the *Antiquary*, a paper very ably conducted by Mr. Burgess, we meet with contributions from several learned natives, among them from his Highness the Prince of Travancore, from Ram Dass Sen, the Zemindar of Berhampore, from Kāshināth Trimbak Telang, from Sasahagiriśāstri, and others, which are read with the greatest interest by European scholars. The collected essays of Ram Dass Sen well deserve a translation into English, and Rajanikānta's *Life of the poet Jajadeva*, just published, bears witness to the same revival of literary tastes and patriotic feelings.

Besides this purely literary movement, there is a religious movement going on in India, the Brahmasamāj, which, both in its origin and its later development, is mainly the result of European influences. It began with an attempt to bring the modern corrupt forms of worship back to the purity and simplicity of the Vedas, and by ascribing to the Veda the authority of a Divine Revelation, it was hoped to secure that infallible authority without which no religion was supposed to be possible. How was that movement stopped, and turned into a new channel? Simply by the publication of the Veda, and by the works of European scholars, such as Stevenson, Mill, Rosen, Wilson, and others, who showed to the natives what the Veda really was, and made them see the folly of their way. Thus, the religion, the literature, the whole character of the people of India is becoming more and more Indo-European. They work for us, as we work for them. Many a letter have I received from native scholars, in which they express their admiration for the wonderful achievements of European ingenuity, for railways, and telegraphs, and all the rest: and yet what, according to their own confession, has startled them and delighted them most, is the interest we have taken in their literature,

and the new life which we have imparted to their ancient history. I know these matters seem small, when we are near to them, when we are in the very midst of them. Like the tangled threads hanging on a loom, they look worthless, purposeless. But history weaves her web out of all of them, and after a time, when we see the full and finished design, we perceive that no colour, however quiet, could have been dropped, no shade, however slight, could have been missed, without spoiling the whole.

And now, after having given this account of our stewardship, let me say, in conclusion, a few words on the claims which Oriental studies have on public sympathy and support.

Let me begin with the Universities—I mean, of course, the English Universities—and more particularly that University which has been to me for many years an *alma mater*, Oxford. While we have there, or are founding there, professorships for every branch of Theology, Jurisprudence, and Physical Science, we have hardly any provision for the study of Oriental languages. We have a chair of Hebrew, rendered illustrious by the greatest living theologian of England, and we have a chair of Sanskrit, which has left its mark in the history of Sanskrit literature; but for the modern languages of India, whether Aryan or Dravidian, for the language and literature of Persia, both ancient and modern, for the language and antiquities of Egypt and Babylon, for Chinese, for Turkish, nay, even for Arabic, there is nothing deserving the name of a chair. When in a Report on University Reform, I ventured to point out these gaps, and to remark that in the smallest of German Universities most of these subjects were represented by professors, I was asked whether I was in earnest in maintaining that Oxford, the first University in what has rightly been called the greatest Oriental Empire, ought to support the study of Oriental languages.

The second claim we prefer is on the Missionary Societies. I have lately incurred very severe obloquy for my supposed hostility to missionary enterprise. All I can say is, I wish that there were ten missionaries for every one we have now. I have always counted missionaries among my best friends; I have again and again acknowledged how much Oriental studies and linguistic studies in general, owe to them, and I am proud to say that, even now, while missionaries at home have abused me in unmeasured language, missionaries abroad, devoted, hard-working missionaries, have thanked me for what I have said of them and their work in my lay-sermon in Westminster Abbey.

Now it seems to me that, first of all, our Universities, and I think again chiefly of Oxford, might do much more for missions than they do at present. If we had a sufficient staff of professors for Eastern languages, we could prepare young missionaries for their work, and should be able to send out from time to time such men as Patteson, the Bishop of Melanesia, who was every inch an Oxford man. And in these missionaries we might have not only apostles of religion and civilisation, but at the same time the most valuable pioneers of scientific research. I know there are some authorities at home who declare that such a combination is impossible, or at least undesirable; that a man cannot serve two masters, and that a missionary must do his own work and nothing else. Nothing, I believe, can be more mistaken. First of all, some of our most efficient missionaries have been those who have done also the most excellent work as scholars, and whenever I have conversed on this subject with missionaries who have seen active service, they all agree that they cannot be converting all day long, and that nothing is more refreshing and invigorating to them than some literary or scientific work. Now what I should like to see is this: I should like to see ten or twenty of our non-resident fellowships, which at present are doing more harm than good, assigned to missionary work, to be given to young men who have taken

their degree, and who, whether laymen or clergymen, are willing to work as assistant missionaries on distant stations; with the distinct understanding that they should devote some of their time to scientific work, whether the study of languages, or flowers, or stars, and that they should send home every year some account of their labours. These men would be like scientific consuls, to whom students at home might apply for information and help. They would have opportunities of distinguishing themselves by really useful work, far more than in London, and after ten years they might either return to Europe with a well-established reputation, or, if they find that they have a real call for missionary work, devote all their life to it. Though to my mind there is no nobler work than that of a missionary, yet I believe that some such connexion with the Universities and men of science would raise their position, would call out more general interest, and secure to the missionary cause the goodwill of those whose will is apt to become law.

Thirdly, I think that Oriental studies have a claim on the colonies and the colonial governments. The English colonies are scattered all over the globe, and many of them in localities where an immense deal of useful scientific work might be done, and would be done with the slightest encouragement from the local authorities, and something like a systematic supervision on the part of the Colonial Office at home. Some years ago I ventured to address the Colonial Secretary of State on this subject, and a letter was sent out in consequence to all the English colonies inviting information on the languages, monuments, customs, and traditions of the native races. Some most valuable reports have been sent home during the last five or six years, but when it was suggested that these reports should be published in a permanent form, the expense that would have been required for printing every year a volume of Colonial Reports, and which would not have amounted to more than a few hundred pounds for all the colonies of the British Empire, part of it to be recovered by the sale of the book, was considered too large.

Now we should bear in mind that at the present moment some of the tribes living in or near the English colonies in Australia, Polynesia, Africa, and America, are actually dying out, their languages are disappearing, their customs, traditions, and religions will soon be completely swept away. To the student of language, the dialect of a savage tribe is as valuable as Sanskrit or Hebrew, nay, for the solution of certain problems, more so; every one of these languages is the growth of thousands and thousands of years, the workmanship of millions and millions of human beings. If they were now preserved, they might hereafter fill the most critical gaps in the history of the human race. At Rome at the time of the Scipios, hundreds of people might have written down a grammar and dictionary of the Etruscan language, of Oscan, or Umbrian; but there were men then, as there are now, who shrugged their shoulders and said, What can be the use of preserving these barbarous, uncouth idioms? What would we not give now for some such records?

And this is not all. The study of savage tribes has assumed a new interest of late, when the question of the exact relation of man to the rest of the animal kingdom has again roused the passions not only of scientific enquirers, but also of the public at large. Now what is wanted for the solution of this question, are more facts and fewer theories, and these facts can only be gained by a patient study of the lowest races of mankind. When religion was held to be the specific character of man, it was asserted by many travellers that they had seen races without any religious ideas; when language was seen to be the real frontier line between man and beast, it was maintained that there were human beings without language. Now all we want to know are facts,

let the conclusions be whatever they may. It is by no means easy to decide whether savage tribes have a religion or not; at all events it requires the same discernment, and the same honesty of purpose as to find out whether men of the highest intellect among us have a religion or not. I call the Introduction to Spencer's *First Principles* deeply religious, but I can well understand that a missionary, reporting on a tribe of Spencerian savages, might declare that they had no idea whatsoever of religion. Looking at a report sent home lately by the indefatigable Governor of New South Wales, Sir Hercules Robinson, I find the following description of the religious ideas of the Kamilarois, one of the most degraded tribes in the north-western district of the colony:—

"*Bhaiami* is regarded by them as the maker of all things. The name signifies 'maker,' or 'cutter-out,' from the verb *bhai*, *baiali*, *baia*. He is regarded as the rewarder and punisher of men according to their conduct. He sees all, and knows all, if not directly, through the subordinate deity *Turramilan*, who presides at the Bora. *Bhaiami* is said to have been once on the earth. *Turramilan* is mediator in all the operations of *Bhaiami* upon man, and in all man's transactions with *Bhaiami*. *Turramilan* means 'leg on one side only,' 'one-legged.'"

This description is given by the Rev. C. Greenway, and if there is any theological bias in it, let us make allowance for it. But there remains the fact that *Bhaiami*, their name for deity, comes from a root *bhai*, to "make," to "cut out;" and if we remember that hardly any of the names for deity either among the Aryan or Semitic nations, comes from a root with so abstract a meaning, we shall admit, I think, that such reports as these should not be allowed to lie forgotten in the pigeon-holes of the Colonial Office, or in the pages of a monthly journal.

What applies to religion applies to language. We have been told again and again that the Veddahs in Ceylon have no language. Sir Emerson Tennant wrote that "they mutually make themselves understood by signs, grimaces, and guttural sounds, which have little resemblance to definite words or language in general." When these statements were repeated, I tried to induce the Government of Ceylon to send a competent man to settle the question. I did not receive all I wanted, and therefore postponed the publication of what was sent me. But I may say so much, that more than half of the words used by the Veddahs, are, like Singhalese itself, mere corruption of Sanskrit; their very name is the Sanskrit word for hunter, *veddhā*, or, as Mr. Childers supposes, *vyādha*. There is a remnant of words in their language of which I can make nothing as yet. But so much is certain: either the Veddahs started with the common inheritance of Aryan words and ideas, or, at all events, they lived for a long time in contact with Aryan people, and adopted from them such words as were wanting in their language. If they now stand low in the scale of humanity, they once stood higher, nay, they may possibly prove, in language, if not in blood, the distant cousins of Plato, and Newton, and Goethe.

It is most essential to keep *la carrière ouverte* for facts, even more than for theories, and for the supply of such facts the Colonial Government might render most useful service.

It is but right to state that whenever I have applied to the Governors of any of the Colonies, I have invariably met with the greatest kindness and readiness to help. Some of them take the warmest interest in these researches. Sir George Grey's services to the science of language have hardly been sufficiently appreciated as yet, and the Linguistic Library which he founded at the Cape places him of right by the side of Bodley. Sir Hercules Robinson, Mr. Musgrave in South Australia, Sir Henry Barkley at the Cape, and several others, are quite aware of the importance of linguistic and ethnological researches. What

is wanted is encouragement from home, and some systematic guidance. Dr. Bleek, the excellent Librarian of Sir George Grey's library at the Cape, who has devoted the whole of his life to the study of savage dialects, and whose *Comparative Grammar of the South African Languages* will hold its place by the side of Bopp's, Diez's, and Caldwell's Comparative Grammars, is most anxious that there should be a permanent linguistic and ethnological station established at the Cape; in fact, that there should be a linguist attached to every zoological station. At the Cape there are not only the Zulu dialects to be studied, but two most important languages, that of the Hottentots and that of the Bushmen. Dr. Bleek has lately been enabled to write down several volumes of traditional literature from the mouths of some Bushman prisoners, but he says, "My powers and my life are drawing to an end, and unless I have some young men to assist me, and carry on my work, much of what I have done will be lost." There is no time to be lost, and I trust, therefore, that my appeal will not be considered importunate by the present Colonial Minister.

Last of all, we turn to India, the very cradle of Oriental scholarship, and here, instead of being importunate and urging new claims for assistance, I think I am expressing the feelings of all Oriental scholars in publicly acknowledging the readiness with which the Indian Government, whether at home or in India, whether during the days of the old East India Company, or now under the auspices of the Secretary of State, has always assisted every enterprise tending to throw light on the literature, the religion, the laws and customs, the arts and manufactures of that ancient Oriental Empire.

There are two surveys carried on at the present moment in India, a literary and an archaeological survey. Many years ago, when Lord Elgin went to India as Governor-General, I suggested to him the necessity of taking measures in order to rescue from destruction whatever could still be rescued of the ancient literature of the country. Lord Elgin died before any active measures could be taken, but the plan found a most powerful advocate in Mr. Whitley Stokes, who urged the Government to appoint some Sanskrit scholars to visit all places containing collections of Sanskrit MSS., and to publish lists of their titles, so that we might know, at all events, how much of a literature that had been preserved for thousands of years was still in existence at the present moment. This work was confided to Dr. Bühler, Dr. Kielhorn, Mr. Burnell, Rajendra Lal Mitra, and others. Several of their catalogues have been published, and there is but one feeling among all Sanskrit scholars as to the value of their work. But they also feel that the time has come for doing more. The mere titles of the MSS. whet our appetite, but do not satisfy it. There are, of course, hundreds of books where the title, the name of the author, the *locus et annus* are all we care to know. But of books which are scarce, and hitherto not known out of India, we want to know more. We want some information of the subject and its treatment, and, if possible, of the date, of the author, and of the writers quoted by him. We want extracts, intelligently chosen—in fact, we want something like the excellent catalogue which Dr. Aufrecht has made for the Bodleian Library. In Mr. Burnell, Dr. Bühler, Dr. Kielhorn, the Government possesses scholars who could do that work admirably; what they want is more leisure, more funds, more assistance.

Contemporaneously with the Literary Survey, there is the Archaeological Survey, carried on by that gallant and indefatigable scholar, General Cunningham. His published reports show the systematic progress of his work, and his occasional communications in the *Journal of the Asiatic Society of Bengal* tell us of his newest discoveries. The very last number of that journal brought us the news of the discovery of the wonderful ruins

of the Buddhist temple of Bharahut,* which, with their representations of scenes from the early Buddhist literature, with their inscriptions and architectural style, may enable us to find a *terminus a quo* for the literary and religious history of India. We should not forget the services which Mr. Fergusson has rendered to the history of Indian architecture, both by awakening an interest in the subject, and by the magnificent publication of the drawings of the sculptures of Sanchi and Amravati, carried on under the authority of the Secretary of State for India. Let us hope that these new discoveries may supply him with materials for another volume, worthy of its companion.

It was supposed for a time that there was a third survey carried on in India, ethnological and linguistic, and the volume published by Colonel Dalton, *Descriptive Ethnology of Bengal*, with portraits from photographs, was a most excellent beginning. But the other Governments have not hitherto followed the example of the Bengal Government, and nothing has of late come to my knowledge in this important line of research. Would not Dr. Hunter, who has done so much for a scientific study of the non-Aryan languages and races of India, take up this important branch of research, and give us, not only photographs and graphic description, but also, what is most wanted, scholarlike grammars of the principal races of India? Lists of words, if carefully chosen like those in Colonel Dalton's work and in Sir George Campbell's *Specimens*, are, no doubt, most valuable for preliminary researches; but without grammars none of the great questions which are still pending in Indian Ethnology will ever be satisfactorily and definitely settled. No real advance has been made in the classification of Indian dialects since the time when I endeavoured, some twenty years ago, to sum up what was then known on that subject, in my letter to Bunsen "On the Turanian Languages." What I then for the first time ventured to maintain against the highest authorities in Indian linguistic ethnology, viz., that the dialects of the Mundas or the Koles constituted a third and totally independent class of languages in India, related neither to the Aryan nor to the Dravidian families, has been fully confirmed by later researches, and is now, I believe, generally accepted. The fact also, on which I then strongly insisted, that the Uraon Koles, and Rajmahal Koles, might be Koles in blood, but certainly not in language, their language being, like that of the Gonds, Dravidian, is now no longer disputed. But beyond this, all is still as hypothetical as it was twenty years ago, simply because we can get no grammars of the Munda dialects. Why do not the German missionaries at Ranchi, who have done such excellent work among the Koles, publish a grammatical analysis of that interesting cluster of dialects? Only a week ago, one of them, Mr. Jellinghaus, gave me a grammatical sketch of the Mundari language, and even this, short as it is, was quite sufficient to show that the supposed relationship between the Munda dialects and the Khasia language, of which we have a grammar, is untenable. The similarities pointed out by Mason between the Munda dialects and the Talaing of Pegu, are certainly startling, but equally startling are the divergences; and here again no real result will be obtained without a comparison of the grammatical structure of the two languages. The other classes of Indian languages, the *Taie*, the *Gangetic*, subdivided into *Trans-Himalayan* and *Sub-Himalayan*, the *Lohitic*, and *Tamulic*, are still retained, though some of their names have been changed. Without wishing to defend the names which I had chosen for these classes, I must say that I look upon the constant introduction of new technical terms as an unmixed evil. Every classificatory term is imperfect. Aryan, Semitic, Hamitic, Turanian, all are imperfect, but if they are but rightly defined

* ACADEMY, August 1, 1874.

they can do no harm; whereas a new term, however superior at first sight, always makes confusion worse confounded. The chemists do not hesitate to call sugar an acid rather than part with an old established term; why should not we, in the science of language, follow their good example?

Many of the most valuable treasures of every kind and sort, collected during these official surveys, and by private enterprise, are deposited in the Indian Museum in London, a real mine of literary and archaeological wealth, opened with the greatest liberality to all who are willing to work in it.

It is unfortunate, no doubt, that this meeting of Oriental scholars should have taken place at a time when the treasures of the Indian Museum are still in their temporary exile; yet, if they share in the regret, felt by every friend of India, at the delay in the building of a new museum, worthy both of England and of India, they will also carry away the conviction that such delay is simply due to a desire to do the best that can be done, in order to carry out in the end something little short of that magnificent scheme of an Indian Institute, drawn by the experienced hand of Mr. Forbes Watson.

And now, in conclusion, I have to express my own gratitude for the liberality both of the Directors of the old East India Company and of the present Secretary of State for India in Council, for having enabled me to publish that work, the last sheet of which I am able to present to this meeting to-day, the Rig-Veda, with the *Commentary of Sāyanāchārya*. It is the oldest book of the Aryan world, but it is also one of the largest, and its publication would have been simply impossible without the enlightened liberality of the Indian Government. For twenty-five years I find, that taking the large and small editions of the Rig-Veda together, I have printed every year what would make a volume of about six hundred pages *octavo*. Such a publication would have ruined any bookseller, for it must be confessed that there is little that is attractive in the Veda, nothing that could excite general interest. From an aesthetic point of view, no one would care for the hymns of the Rig-Veda, and I can well understand how in the beginning of our century even so discriminating a scholar as Colebrooke could express his opinion, that "The Vedas are too voluminous for a complete translation, and what they contain would hardly reward the labour of the reader, much less that of the translator. The ancient dialect in which they are composed, and especially that of the three first Vedas, is extremely difficult and obscure; and, though curious, as the parent of a more polished and refined language, its difficulties must long continue to prevent such an examination of the whole Vedas as would be requisite for extracting all that is remarkable and important in those voluminous works. But they well deserve to be occasionally consulted by the Oriental scholar." Nothing shows the change from the purely aesthetic to the purely scientific interest in the language and literature of India more clearly than the fact that for the last twenty-five years the work of nearly all Sanskrit scholars has been concentrated on the Veda. When some thirty years ago I received my first lessons in Sanskrit from Professor Brockhaus, whom I am happy and proud to see to-day among us, there were but few students who ventured to dive into the depths of Vedic literature. To-day among the Sanskrit scholars whom Germany has sent to us—Professors Stenzler, Spiegel, Roth, Weber, Haug, Pertsch, Windisch—there is not one who has not won his laurels on the field of Vedic scholarship. In France, also, a new school of Sanskrit students has sprung up who have done most excellent work for the interpretation of the Veda, and who bid fair to rival the glorious school of French Orientalists at the beginning of this century, both by their persevering industry and by that "sweetness and light" which seems to be the birthright of their nation. But, I say again,

there is little which is beautiful in our sense of the word to be found in the hymns of the Rig-Veda, and what little there is has been so often dwelt on, that quite an erroneous impression as to the real nature of Vedic poetry has been produced in the mind of the public. The Dean of St. Paul's, for instance, in some thoughtful lectures which he delivered this year on the "Sacred Poetry of Early Religions," has instituted a comparison between the Psalms and the hymns of the Veda, and he arrives at the conclusion that the Psalms are superior to the Vedic hymns. No doubt they are, from the point of view which he has chosen, but the chief value of these hymns lies in the fact that they are so different from the Psalms. They are Aryan, the Psalms Semitic; they belong to a primitive and rude state of society; the Psalms, at least most of them, are contemporaneous with or even later than the heydays of the Jewish monarchy. This strange misconception of the true character of the Vedic hymns seemed to me to become so general, that when some years ago I had to publish the first volume of my translation, I intentionally selected a class of hymns which should in no way encourage such erroneous opinions. It was interesting to watch the disappointment. What, it was said, are these strange, savage, grotesque invocations of the Storm-gods, the inspired strains of the ancient sages of India? Is this the wisdom of the East? Is this the primeval revelation? Even scholars of high reputation joined in the outcry, and my friends hinted to me that they would not have wasted their life on such a book.

Now, suppose a geologist had brought to light the bones of a fossil animal, dating from a period anterior to any in which traces of animal life had been discovered before, would any young lady venture to say by way of criticism, "Yes, these bones are very curious, but they are not pretty!" Or suppose a new Egyptian statue had been discovered, belonging to a dynasty hitherto unrepresented by any statues, would even a school-boy dare to say, "Yes, it is very nice, but the Venus of Milo is nicer." Or suppose an old MS. is brought to Europe, do we find fault with it because it is not neatly printed? If a chemist discovers a new element, is he pitied because it is not gold? If a botanist writes on germs, has he to defend himself because he does not write on flowers? Why, it is simply because the Veda is so different from what it was expected to be, because it is not like the Psalms, not like Pindar, not like the Bhagavadgītā, it is because it stands alone, by itself, and reveals to us the earliest germs of religious thought, such as they really were; it is because it places before us a language, more primitive than any we knew before; it is because its poetry is what you call savage, uncouth, stupid, horrible—it is for that very reason that it was worth while to dig and dig till the old buried city was recovered, showing us what man was, what we were, before we had reached the level of David, the level of Homer, the level of Zoroaster, showing us the very cradle of our thoughts, our words, and our deeds. I am not disappointed with the Veda, and I shall conclude my address with the last verses of the last hymn, which you have now in your hands,—verses which thousands of years ago may have been addressed to a similar meeting of Aryan students, and which are not inappropriate to our own:—

"Come together! Speak together! Let your minds be concordant—the gods by being concordant receive their share, one after the other. Their word is the same, their counsel is the same, their mind is the same, their thoughts are at one; I address to you the same word, I worship you with the same sacrifice. Let your endeavour be the same! Let your hearts be the same! Let your mind be the same, that it may go well with you."

We are compelled to postpone till next week our analysis of Professor Martin Haug's paper on the Rig-Veda, as well as the other communica-

tions to the Aryan section. In our next issue we shall also give an account of the proceedings in the Hamitic section, as well as a verbatim report of the addresses of Sir W. Elliot, Mr. Grant Duff, and Professor Owen, and the proceedings of the sections over which these gentlemen severally preside.

To-day (Saturday) the members of the Congress dine with the Lord Mayor at the Mansion House.

FINE ART.

ALL Paris has crowded this last fortnight to the Palais des Beaux-Arts to see M. Baudry's fresco decorations for the new Opera House. On one day alone 3,000 persons were present, although the exhibition is not gratuitous. The paintings are seen under the greatest disadvantage. Being designed for the decoration of the curves of a vaulted or arched ceiling, hanging as they are flat against a wall, the perspective is wonderfully distorted; and the colouring, meant only for gas-light, is ill calculated for the rays of the sun, which pour into the room. The flesh tints appear brown, and the colours pale and inharmonious. The paintings also are seen too low, as compared with the position they are finally to occupy. The work is enormous, and has been the labour of eight years—a labour of love, in part, for M. Baudry has executed considerably more than he agreed at the original estimate. The composition is most carefully conceived, as illustrating the powers of Poetry, Music, and Dancing.

The central compartment of the ceiling represents the sisters Melody and Harmony ascending to the spheres, with, on one side, Poetry carried away on a fiery Pegasus; on the other, Fame with trumpet and laurel crown. Tragedy and Comedy occupy the two ovals of the ceiling. Tragedy, accompanied by Fear, Pity, and Anger, is attired in a novel costume copied from an ancient sarcophagus. Comedy is amusing herself in casting her arrows at a Faun whom she is throwing down headlong in a most awkward manner.

The subjects in the curves of the ceiling (*voussoirs*) consist of two large and ten small. The principal is Parnassus, one of the best compositions of the whole; Apollo, with his attendant Hours, Muses, and Graces. The other, Poetry, with the great poets of antiquity, and the painters and sculptors whom their works have inspired.

The other paintings are expressive of the various characteristics and effects of music and dancing. The assuasive power of music is symbolised in David soothing the melancholy of Saul, in Orpheus restoring Eurydice to life, and in the deep majestic strains of St. Cecilia on the organ. Martial music animates the warrior, the simple music of the syrinx is the solace of pastoral life, and the triumph of ideal over realistic music is exemplified in the punishment of Marsyas for having presumed to vie with the god of song and poetry. Dancing is represented under unpleasant aspects—the dance of Salome before Herod, the noisy dance of the priests of Cybele round the cradle of Jupiter, and the frantic dance of the Furies round the body of Orpheus. Evidently, the art is not in favour with the painter.

Between each of these subjects are colossal figures of the Muses, above twelve feet high; and one, Polyhymnia, as the least vivacious, is excluded, there being only space for eight. Eight medallions of children illustrate the musical instruments belonging to each country. Italy claims the violin, France the trumpet and fife, to Great Britain is assigned the Irish harp and the bagpipe.

As we have before stated, M. Baudry's works have been exhibited under every disadvantage. Friends are clamorous in their praise, critics in finding fault. Their exhibition under such disadvantages has been unfortunate for the painter; but no doubt, when removed to the definite places assigned to them, his works will regain their true perspective, and assume their proper harmony of colouring. The whole is a grand

composition, and worthy of the edifice it is designed to embellish.

THE high praise given, in last week's *Builder*, to Mr. "Henry" Ellis, of Rome, for his admirable drawing of Anthony and Cleopatra in Elysium, in the last number of *Art*, should have been bestowed on Mr. "Edwin" Ellis, who is the artist that drew this two-year-old sketch. He is the younger son of Mr. Alexander J. Ellis, F.R.S., the late President of the Philological Society; and we regret to learn that he is suffering so greatly from the weakness left by an attack of diphtheria at Perugia, that he is unable to stand or paint.

THE commission for the statue to Lamartine met a short time ago to examine the photographs of the models destined for competition. The *Chronique* reports that at the sight of one of these "un suffrage unanime s'est échappé de l'assistance." The models themselves will shortly be exhibited at the Ecole des Beaux-Arts, and prizes adjudged by a jury to the four best designs. The first will receive 3,000 fr., the second 2,000 fr., the third 1,500 fr., and the fourth 1,000 fr.

THE *Rappel* states that MM. Monduit Béchét et Cie., who were charged with the restoration of the Colonne Vendôme, have nearly completed their difficult work, and that the column will probably be set up again in the course of the autumn.

The Vendôme Column was not erected according to the original idea of Napoleon I. The first decree for its erection is dated October 1, 1803, and is signed by the First Consul. By this decree we find that the design for the column was to be similar to that of Trajan at Rome, that it was to be ornamented with 108 bronze figures representing the departments of the Republic, and surmounted by a pedestal adorned with olive leaves, on the top of which a statue of Charlemagne, the representative monarch of France, was to be placed. But all this was changed after the great victories of 1806. The column was then consecrated to the glory of the "Grande Armée," and was cast from 1,200 cannon taken from the enemy, Napoleon I. taking the place of Charlemagne. He first appeared in classical costume, but before long the well-known figure of "Le petit Caporal" was set up.

M. DE NIEDERHOESEN'S *Mur de Tibère à Capri*, a work that attracted much notice at the last Salon, has been bought by the French Government.

MARSHAL MACMAHON, during his recent official tour, visited the Church of Ste. Anne at Auray. This church, which is built entirely of granite, is one of the finest modern churches in France. M. Deperther, one of the architects of the Hôtel de Ville of Paris, constructed it, and no expense has been deemed too great in its decoration. A colossal statue of Ste. Anne, designed by M. Falguière, will shortly be placed, it is stated, in the tower—a statue that will weigh 40,000 kilogrammes! Distinguished pilgrims to this church are requested to sign their names in a book kept for the purpose by the Abbé. The Maréchal, in compliance with this custom, signed his, says a French correspondent, after those of Napoléon, Eugénie, and Prince Albert of Monaco and Lamoignon!

IN consequence of the great development in other cities of Germany of the special branches of industry, as watch and toy-making, of which Nürnberg at one time enjoyed if not the monopoly, at any rate the principal share, the Bavarian Government has determined, by the establishment of more efficient local schools of art, to give the Nürnberg artisans the opportunity of recovering their lost prestige. Of late years the specialities of Nürnberg have been almost wholly cheap toys, playthings and fancy articles of inferior quality; in olden times, however, the reputation of the

town was of a very different character, and there is scarcely an art collection in any part of Germany that is without evidence of the skill of the Nürnbergers of past ages. Every art connoisseur is familiar with the drinking cups, goblets, christening mugs, silver and gold plate, and all the clocks, watches and other ingenious inventions for which the place was specially famed in the Middle Ages; while in the city itself the memorials of its past artistic excellence and ingenuity meet one at every turn. In the present day, however, Nürnberg no longer gives evidence of artistic proficiency in any branch of industry, and it is to reawaken its lost sense of the beauty and the excellence of its old works of art, that the Government has opened new schools of art and an art museum, which is to be in connexion with the older local art schools. It is to be hoped that the fresh incentive given to artistic culture in this ancient seat of German art may have the desired effect of reviving the higher forms of German art for which it was once so famous, and at the same time imparting some slight degree of taste and finish to the inferior branches of industry with which its name is now almost solely associated.

THE Chambre du Tribunal Civil have been lately called upon to decide an interesting question relative to the purchase of works of art. In January last Mme. Aline Noël, a picture dealer, offered a painting on wood by Diaz for sale to M. Neuburger for 9,000 francs. Thinking the price exorbitant, M. Neuburger showed the picture to M. Duval, an "expert," who valued it at from 2,500 to 3,000 francs. M. Neuburger purchased it at the latter price, with the right to Mme. Noël of reclaiming it, if she had a higher offer within three days of the sale. The time passed, and M. Neuburger was about to hang the painting in his gallery, when he received a visit from the police, saying that an action was entered against Mme. Noël for breach of trust. M. Willems, the proprietor, having fixed the price of sale at 9,000 fr., and required of M. Neuburger the restitution of the picture, without restoring to him the sum paid, and also demanding 3,000 francs interest and damages. M. Neuburger naturally resisted the demand, alleging he had neither lost nor stolen the picture, but had paid the full price at which it had been valued, but at the same time offered to give up the picture at the price he had paid for it. The Court decided in favour of M. Neuburger, who had shown good faith in the transaction, and declared that if M. Willems sought for reparation, it must be against Mme. Noël, who had committed the breach of trust.

M. ED. PIETTE has just discovered in the grotto of Gourdan (Haute-Garonne) a bone flute. The instrument has only two holes, perfectly round, and carefully worked, and is similar to those used by the people of Tahiti when visited by Captain Cook. A similar instrument, also with two holes, was found some time back by M. A. Villot, a naturalist of Grenoble, and given by him to the Statistical Society of the Isère. With such instruments it was only possible to produce four sounds, and, like the Japanese and Chinese who have only five notes in their gamut, the songs these instruments served to accompany must have been singularly monotonous and unmelodious.

THERE has been discovered at the Castello di Malpaga, near Bergamo, a fresco which is attributed to Titian, representing the visit of Christian I., King of Denmark, in 1454, to the famous condottiere Bartolomeo Colleoni, who had retired and held his court there in his old age, after having successively served the Visconti against Venice, the Duke of Saxony, and Florence against the Duke of Urbino.

THE excavations at Rome bring every day to light some new object of interest; among the last is a magnificent bust in perfect condition of the Empress Plotina, wife of Trajan, which will be deposited in the Museum of the Capitol.

IN the Salle des Archives at the Hôtel de Ville, Antwerp, is preserved the will of Rubens, signed by himself and his second wife Helena Froment. Also the will of Teniers. The archives, which only date from the memorable siege in 1585, by the Duke of Parma, are mostly kept enclosed in curious canvas bags. They are now under course of arrangement in volumes.

AMONG the most remarkable objects in Christoffe's fine collection in the Palais de l'Industrie, are his reproductions of the copy made by Zécharie Astruc of the celebrated statue of St. Francis d'Assisi in the cathedral at Toledo, the masterpiece of Alonzo Cano, the architect, sculptor, and painter. This remarkable statue has been carefully preserved in one of the chapels, placed within the tower, and completely closed to the public. It formed part of the secret treasure of the cathedral, and while other precious pieces are annually exposed at the religious fêtes, this statue has long been entirely withdrawn from public view. It was only through special favour and by consent of the chapter, that Astruc was allowed to take a copy, which an official certificate of the dignitaries of the cathedral declares to be identical in every point of view.

The saint is represented with his hands crossed under the ample folds of the habit of his order, his head enveloped in his cowl, his eyes upraised to heaven, the expression of his pallid features most sublime. His gown torn on the side of the heart shows a bleeding wound. Nothing can be finer than the delicate finish of the whole.

MM. Christoffe have reproduced the statue in painted wood exactly conformable to the original, and also in bronze enriched with coloured patines, and in marble.

M. LE VICOMTE DE CUMONT, the Minister of Public Instruction in France, and M. Caillaux, Minister of Public Works, lately made an official visit to the New Opera House, and reported that they were well satisfied with the progress of the works, a progress that permitted almost the certain assurance that the new Opera would be ready by the time announced, namely, the first day of 1875. The ministers afterwards visited the atelier of the scene-painters, and were shown various scenes from *Faust*, *La Juive*, *Les Huguenots*, and *La Favorite*, painted by MM. Rubé and Chaperon and other artists, whom the ministers warmly congratulated on the success of their work. The scene-painting of the new opera is said indeed to exceed all previous achievements in that style of art.

A CONSIDERABLE difference of opinion prevails regarding the desirability of the proposed removal of the statue to Queen Anne, which stands in front of St. Paul's Cathedral. Conservatives cry "Let it stand!" Radicals, "Clear it away!" and the same vexed question is being argued in regard to very many other obstructive or ugly relics of the past. "If every succeeding generation is to sweep away the memorials raised by that which preceded it," says a writer in the *Builder*, "history will have no landmarks."

THE STAGE.

"LOST IN LONDON" AT THE PRINCESS'S THEATRE.

AS we were recently able to chronicle the reappearance on the London stage of the real horse, we are now happy to add that the real carriage has in its turn arrived. Not that Mr. Watts Phillips's drama, *Lost in London*, is solely dependent for success on this phenomenon. It teems with realities: real coal-mines, galleries, workings, pickaxes, safety-lamps, shafts, baskets; real primadonnas, pianos, chandeliers, sofas, street-lamps, snow; and no more grievous fault in this respect can be laid to the charge of the dramatist than that the newspapers which are a source of witticism to one of the characters, bear a date of issue which, if genuine, throws the chronology of the play into hopeless confusion. This minuteness of

detail is the prominent feature of the drama. There are still a few English playwrights who, having created the part of a London footman, having called him Blinker, and having made him a student of the pugilistic columns of sporting newspapers, would have been content to leave the audience to understand that he was also a lover of comic song and a proficient in the break-down dance. The realistic school puts no such strain on the imagination, but with a view to exactness causes an excellent comedian to sing verses of wretched doggerel and cut capers that would be creditable to a plantation negro. Interludes of this kind are also provided for the higher classes. The villain of the play gives a musical party at the house of his mistress, and invites persons of high distinction to listen to the vocal cascades of an Italian singer; and it is scarcely necessary to add that the parts of the persons of high distinction are sustained by the celebrated Adelphi guests, who have taken advantage of the union under one management of the Princess's and Adelphi Theatres to enjoy a temporary change of scene. Their appearance caused lively satisfaction to the audience. And, indeed, there is no company of players in the world so skilled as these veterans in suddenly leaving ball-rooms when the evil personages would talk apart, in suddenly returning when frantic rustics burst into the scene of gaiety and claim their ravished wives, or in vindicating the honour of outraged society in attitudes of astonishment and disgust. It will therefore be seen that *Lost in London* fulfils all the purposes of the class to which it belongs. The class is easily defined by the means which it employs. As tragic drama moves by terror and pity, so domestic drama moves by real carriages and comic songs.

With this reference to the essential parts of the play we may pass to its accessories, which are the story, the dialogue, and the acting. The story conveys the lesson that in the country nature is pure, and in the town nature is adulterated; that in the country alone are kind hearts and simple faith, and in the town nothing but rogues and seducers. Therefore the country folk held the town exceedingly cheap. The father of Job Armroyd, the miner, had worked in the pit for sixty years, and should have known something of the world: and when he went to London he thought nothing of it. But the wife of Job Armroyd had not the experience of her father-in-law, and she had met a city gallant who said that her face was engraven on his heart, and that an instant had riveted chains which an eternity could not break. So she fled with him, was followed by Job, and finally died under the shadow of the city which had been her ruin. The plot has not taxed the author's inventive powers very heavily; but the characters do credit to his application as a student of Dickens. The four leading personages, Job Armroyd, Nelly Armroyd, Mr. Blinker, and Tiddy Druggleshorpe, are close imitations of Daniel Peggoty, Little Em'ly, Sam Weller, and Tilly Slowboy; and it is curious that the four players who now enact these parts—Mr. Emery, Miss Lydia Foote, Mr. Belmore, and Mrs. Alfred Mellon—have shown themselves exactly suited to the original characters. It is right to add that the moral of the play, as well as its machinery, worked very smoothly. The spectators were particularly impressed with the arrangement of the basket and shaft of the mine. The art of sinking, whether in sentiment or coal-pits, is excellently illustrated by the drama.

"THE TWO ORPHANS" AT THE OLYMPIC THEATRE.

THE French taste for melodramas of inordinate length is conspicuously shown whenever such pieces as *Le Juif Errant* are performed at the Théâtre du Châtelet, Paris. Thither at six o'clock flock worthy tradesmen from Batignolles or Montmartre, each with his wife, child, and domestic servant—the father of the family to be agreeably stimulated by the machinations of

wicked priests who aspire to the Papacy, the wife to suck oranges and crack nuts, the child to remark upon the dresses of ladies in the balcony, and the servant to weep for the widows and orphans whom the Jew always arrives in time to assist. The ordinary mind is sated in a few hours, goes out perchance to refresh itself, and returns after midnight to find the honest tradesman just beginning to simmer with excitement, his wife beginning to collect in small piles all that remains of the oranges and nuts, the child asleep in the servant's arms, the ecclesiastic still holding steadily before his eyes the example of the low-born Sixtus V., and the Jew still appearing at suitable moments, until at last wooden figures of angels blowing trumpets are swung across the stage, and a painted representation of the end of the world, by way of transformation scene, brings the play to a pious conclusion. *Les Deux Orphelines* is a melodrama of this class. It is a stupendous work composed in eight acts. It is written by two authors, and its contents are those of two ordinary dramas. It has two heroes, two heroines, two persecutors of innocence, two defenders of virtue, two counts, two marquesses, two confidential servants, and an inexhaustible supply of gendarmes, criminals, sisters of mercy, peasants, market-women, soldiers, and beggars. At present we are quite unable to criticise so vast a performance. We can only attempt to disentangle the mass of threads and thrums which is called the story.

Two orphans from Normandy come to Paris a few years before the Revolution, and on their arrival are forcibly abducted. Henriette falls among fashionable villains, Louise among rogues of the commonest class. Henriette is carried to the Pavillon du Bel-air, the summer-palace of the Marquis de Presles, where she finds herself among dandies and courtesans, among ruffles and satins, powdered wigs and pig-tails, gowns *en fourreau lacé* and sleeves *en sabot*, among the "odours of the essence-pot, amber, musk, and bergamot"—in one of those scenes, in short, where the French nobility of the period met for social intercourse and exchange of the "argot de petites canailles." The blind Louise is less fortunate: she is kidnapped by a hag named La Frochard, and made to sing in the streets. After many troubles the orphans are delivered. Henriette finds a champion in the Chevalier de Vaudry, who kills the wicked marquis in a duel with swords, and Louise finds a champion in Pierre, the crippled son of La Frochard, who kills his wicked brother in a duel with knives. So far the tale is simple enough; but MM. D'Ennery and Cormon have a number of melodramatic incidents to mix with this plain fare. Before the end of the play is reached the archives of the police have to disgorge secrets, countesses have to conceal mysteries of their early lives, counts have to discover them with the aid of spies, convicted prisoners have to be substituted for one another, warrants have to be issued and pardons signed, with much interesting matter of a like nature. Nor is the local colouring neglected. There is a representation of the church of St. Martin, to which ladies are carried in sedan-chairs, that they may not expose "l'enbonpoint de leurs plumes aux inclemences de la saison pluvieuse." There is also a representation of the famous Salpêtrière prison, which a French historian has called "une Sodome de fureurs libertines, et d'effrénées violences." But fortunately the dramatists have not thought fit to draw the veil from these horrors.

The play has been translated into English by Mr. John Oxenford, and Miss Fowler, Miss Ernstone, Mr. Neville, Mr. Anson, and Mr. Charles Sugden have appeared in it. The translation is vigorous, and the parts are consistently sustained. And the drama may be allowed to take place with M. Littré's dictionary as a standing protest against the charge of literary flimsiness on which French authors are continually indicted.

WALTER MACLEAN.

As a satire against English institutions and a representation of English manners, the French comic opera called *Les Cent Vierges* has not received the attention which it was entitled to expect from this country. It is the history of ninety-eight wise virgins and of two foolish virgins. The English Admiralty having sent a hundred male colonists to people an uninhabited spot called the Green Isle had omitted a very necessary article from the cargo, and had therefore received a petition from the emigrants that they would send another detachment of colonists composed exclusively of women. The enlistment of a hundred maidens had been ordered to take place at the "Royal George," a river-side tavern near the London docks, where a band of mariners assembled to speed the parting crew with songs of "Vive le gin, la bière, le scherry!" while the daughter of the tavern-keeper sang the praises of porter "pour accompagner le chester." The ceremony was to be conducted by a police-constable, whose reception was a source of inordinate pride to the proprietor of the "Royal George" and of rage to the proprietor of the neighbouring public-house: but despite the exertions of "his honour," the number of damsels would have fallen short of the required number by two if the wives of the Duke Anatole de Quillenbois and M. Poulardot had not suddenly arrived from France and inscribed their names in the book which they believed to contain a visitor's list. Need we say that the distracted husbands followed them to the Green Isle on a barrel, and were fortunate enough to arrive before the English man-of-war; that to escape from the fury of the colonists, whose governor was Sir Jonathan Plupersonn, and whose officers were named Calsonn, Bitter, Moninor, Interlopp, Gropater, and Hosteball, they disguised themselves as women; that they won the favour of Sir Plupersonn by addressing him familiarly as Sir Jonathan; and that a revolt of the colonists finally restored them to their wives? The music of M. Lecocq is in some places superior to that of *La Fille de Madame Angot*, and is always more popular than that of *Giroflé-Girofla*, but the composer turns his gift to very base uses when he sets to music the process of cooking an omelette. The burden of the English version by Mr. Reece, produced on Monday at the Gaiety Theatre, falls upon Miss Farren, Mr. J. G. Taylor, and Mr. Arthur Cecil. Miss Farren is the merriest actress on the stage, Mr. Taylor has a fund of quiet drollery that is peculiar to him, and Mr. Cecil sings with the taste of a musician. His fun is the fun that charmed us at the Gallery of Illustration. When the Duke Anatole discovers the departure of his wife there is an inimitable wildness in his gaze, which recalls the days when Mr. Cecil was wrecked on a desert island, with Mr. and Mrs. German Reid and Mr. Corney Grain, and kept his companions in subjection by the magic of his glass eye.

THE Vaudeville Theatre has returned to its old love *The Two Roses*, and has found the comedy as fresh as during her former courtship. We shall shortly have occasion to notice a performance by which Messrs. James and Thorne have fully justified the claim of their theatre to be ranked among the few houses in London where the interests of true art are strictly regarded.

THE Lyceum Theatre will revive *The Bells* on Monday, September 28. *Hamlet* will be produced during the course of the season, with Mr. Henry Irving, Mr. Swinbourne, Mr. Chippendale, Mr. Compton, Miss Pauncefort, and Miss Isabel Bate-man in the principal parts.

TO-NIGHT Mdlle. Beatrice appears at the Haymarket Theatre in the English version of *Nos Intimes*; and Miss Lydia Thompson at the Charing Cross Theatre, in an extravaganza called *Blue Beard*. At the latter theatre the comedy of Mr. Burnand is postponed.

MADAME CELESTE will appear at the Adelphi Theatre on October 3, in *The Green Bushes*.

THE Prince of Wales' Theatre opens to-night, and performs *The School for Scandal* for the 100th time.

THE theatrical sensation of the last week in Paris seems to have been the cleaning and decoration of the Théâtre de l'Ambigu-Comique, the former manager of which was proverbial for stinginess. An excellent comedy by MM. Jules Adenis and Rostaing has been produced at this theatre, called *L'Officier de Fortune*. Scribe's comedy *Une Chaine* has been revived at the Théâtre Français, with M. Got, M. Coquelin, and Mdlle. Favart in the chief parts. The Théâtre de la Renaissance has opened with a comic opera composed by M. Vasseur, and named *La Famille Trouillat*. The Théâtre du Palais Royal has produced a comedy called *Les Samedis de Madame*.

MUSIC.

THE prospectus of the coming series of Saturday Concerts at the Crystal Palace, which commences on October 10, has just been issued, and for the interest and variety of its promises fully sustains the reputation of previous years. Among the chief works announced for performance for the first time at these concerts, are Bach's Church-Cantata "My spirit was in heaviness" ("Ich hatte viel Bekümmerniss") and his Suite in C major for orchestra, Handel's *L'Allegro* with Franz's additional accompaniments, a selection from Schubert's operetta *Die Zwillingsbrüder*, Mendelssohn's 95th Psalm, Weber's "Jubilee Cantata," two symphonies by Haydn, an adagio and fugue for orchestra by Mozart, and the same composer's Violin Concerto in D, Spohr's First Symphony, Joachim's Violin Concerto in G, Brahms's Serenade in A for small orchestra, and the same composer's arrangement for full orchestra of his "Hungarian Dances," Wagner's *Faust* overture, Liszt's Second Piano Concerto, Rubinstein's overture to *Dimitri Donskoi*, Raff's *Lenore* symphony, Lachner's Sixth Suite for orchestra, a new symphony in C by Sir Julius Benedict, Mr. G. A. Macfarren's new violin concerto, Pierson's overture to *Romeo and Juliet*, Mr. Alfred Holmes's cantata *Jeanne d'Arc*, Sir F. Osseley's oratorio *Hagar*, and a selection from Sullivan's *Land and Sea*. Such a prospectus is the more satisfactory as Mr. Manns and the directors of these admirable concerts are not, like our operatic *impresarii*, in the habit of making promises which they do not perform. In addition to the works enumerated above, many of the standard masterpieces of the great composers will be introduced into the programmes, and a most instructive and enjoyable series of concerts may fairly be anticipated.

WE regret to have to announce the death of Mr. Papé, who for several years past has held the important post of first clarinet in the Crystal Palace band. He had been for a considerable time suffering from disease of the lungs; but till within a comparatively recent period was able to discharge his duties in the orchestra as usual. As a performer on his instrument he had few if any superiors, whether as regards purity and beauty of tone or artistic finish of execution; while in his personal relations he was esteemed and respected by all who had the pleasure of his acquaintance.

IN supplementing our last week's notice of the Gloucester Musical Festival, mention should be made of Canon Barry's sermon at the Friday evening's service which brought the proceedings to a close. The continuance of the meetings of the Three Choirs in the present shape has been for some time under discussion, and it is understood that the authorities of Worcester are very desirous that they should approximate to their original plan, and be merely services, and not, as at present, performances of sacred music. Dr. Barry's sermon, advocating this view, has been described by one of our daily contemporaries as a "clerical

manifesto." His two chief objections to the present form of the festivals were, first, that the meetings were originally established merely for the perfecting of the choral music of the cathedrals, and that their charitable objects were an afterthought; and, secondly, that it would be possible to associate the performances with the services of the church—in the same way, presumably, as has recently been done on various occasions in St. Paul's Cathedral and Westminster Abbey. That public feeling, however, is opposed to such a change is apparent from the resolution unanimously agreed to by the stewards of the present Festival, at a meeting held in the Chapter House on the Friday afternoon, which was couched in the following terms:—"That, before separating, the stewards of the Gloucester Festival of 1874 desire to express their regret at the general currency of a rumour to the effect that the discontinuance of the meeting of the Three Choirs on its present footing has been seriously discussed by the authorities of the three cathedrals; and to place on record their deliberate opinion that such a step would be fatal to the efficiency of the charity, that it would discourage the successful cultivation of sacred music, so much promoted by these annual festivals, and would deprive the local public of their only opportunity of hearing oratorios, as interpreted by the highest artistic talent of the day." A copy of this resolution was further ordered to be forwarded to the Dean and Chapter of each of the three cathedrals concerned; and it is to be hoped that the representations will have the desired effect. A word of acknowledgment is due, in conclusion, to Mr. F. W. Waller, the secretary to the stewards, and to the gentlemen associated with him, for their courtesy and readiness to assist the members of the press.

A SERIES of letters, purporting to be written by Mendelssohn, is at present appearing in the columns of our contemporary, the *Choir*. Those which have already been published are, however, written in such a "jaunty" style, so different from Mendelssohn's usual very gentlemanly manner of expression, that some curiosity is felt as to whether they are really genuine, or whether they have only been very badly translated. We must say that we regard them with considerable suspicion, as reference is made in the very first letter to the "Wedding March," which was composed in 1842 or 1843, while Goethe died in 1832. We trust that Herr Heinrich von Meister, who has supplied the letters in question, will take an early opportunity of clearing up the doubts which not unnaturally exist.

GLUCK's *Iphigénie en Tauride* was revived last month at Munich, after being shelved for many years. The part of Pylades was sung by Herr Vogl.

TWO concerts are to take place at Sondershausen, on the 27th and 28th inst., for the benefit of the Widows' and Orphans' Fund of the orchestra in that town. The programmes will be entirely selected from the works of Beethoven, and will include the overtures to *Leonore* (No. 3), and to the *Weibe des Hauses*, the concerto in E flat, the triple concerto in C, the Kreutzer Sonata, and the Choral Symphony, besides various songs.

THE celebrated Gewandhaus concerts at Leipzig are to be resumed early next month. The *Signale* states that Mr. Charles Hallé and Mme. Norman-Neruda are engaged for the first concerts.

THE *Continental Herald* and *Swiss Times* states Mr. M. W. Whitney, the Boston basso, has received and accepted an offer of an engagement of six months at the Royal Albert Hall, London, for a series of oratorio and classical concerts under the directorship of Messrs. Barnby and Arthur Sullivan.

WE learn from the *Pall Mall Gazette* that a new distinction—the Order of the Lyre—for persons eminent in the musical and dramatic professions is, it is said, to be created in Germany. The Duke of Meiningen is also about to give a gold medal for distinguished services in the causes of science and art.

THE same paper states that Signor Verdi has just obtained an injunction in the local court at Boulogne to prevent the performance of his *Messe* without orchestral accompaniments. The conductor proposed to give the Mass with an accompaniment of four pianos, to which the composer strongly objected, and, finding remonstrances useless, took legal proceedings.

IT also announces the death of a young Belgian composer of great promise, Willem de Moe, who in 1871 gained the Prix de Rome at the Conservatoire de Musique at Brussels. Herr de Moe was an experienced conductor, and directed one of the most famous of the Belgian choral societies, the "Artisans Réunis." He had composed several cantatas and symphonies, and had just completed an oratorio entitled *The Seasons of Life*.

POSTSCRIPT.

IT has been ascertained that extensive seams of coal of superior quality underly the steppe along the northern shore of the Sea of Azoff, and the Azoff ports appear to have a brilliant future before them as outlets for the commodity, as capital is now being invested in its extraction. Indeed, throughout the country embraced by the Dneiper and the Crimea, indications of similar coal have been discovered.

THE comic opera by Johann Strauss, which is now in rehearsal at the Gaiety Theatre, will be entitled *The Forty Thieves*. It was originally brought out in Vienna at the Theater an der Wien (the cradle of *Zauberflöte* and *Fidelio*), in March or April, 1871, under the name of *Indigo und die Vierzig Räuber*. The opera was very successful, not only in Vienna, but in many towns in Austria and Germany, chiefly on account of its extremely pretty music. Some of the waltzes which form part of it are already generally known in England. The original libretto, a fruit of the collaboration of about half-a-dozen renowned Viennese feuilletonists, must undergo great changes, as it contains so much nonsense that in its present shape it would scarcely be acceptable to an English audience.

M. DUMAS' play *Le Demi-monde* will be definitively performed at the Théâtre Français, Paris, with M. Delaunay, M. Got, Mme. Nathalie, Mdlle. Croizette, and Mdlle. Tholer in the principal characters.

No. 125, *New Series*.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

LITERATURE.

The Legends of S. Kentigern. (Edinburgh: Printed for Private Circulation, 1872.)

THIS volume took its origin in a design of the author for preparing a complete *Kalendar of the Scottish Saints*, a work which has since been worthily carried out in a devout spirit by the learned Bishop of Brechin, who was eminently qualified for the task. The author will never fulfil his projected book—in fact, there is ground for believing that a posthumous work is here presented to the public. It may be as well to say at once that there are perceptible deficiencies of style in the use of provincialisms, and also a total absence of the old ring in the translations from Ritual books, betokening a want of familiarity with set prayers and Church use. These, however, are only slight defects when weighed against the general fairness and good temper, the sound sense and careful discrimination, shown by one who yet curtly and coldly calls the revered saints of the Hagiologists by the heathenish title of *Dii Minores*, and is, unknown to himself, urged by a factitious interest, wholly devoid of congenial sympathy, to treat on the subject at all. He had no faith in it.

It is a curious fact in literary history, that authors frequently pride themselves upon qualities which are an imaginary possession, to the disparagement of the very points in which they are peculiarly strong. Many a man has desired to be regarded as a poet, for instance, when his lines are doggerel, and his prose moves as stately as music to the ear. In this volume the author believed that, in spite of an unequivocal failure, he had “preserved some of that ecclesiastical aroma without which” (*Services*) “would be like salt which has lost its savour,” whilst he accuses the Appendix of “running to a laborious and weary, and probably also to a tedious length,” whereas it constitutes the backbone of the volume, and forms its claim to attention. To it the reader will almost instinctively turn.

The point which at once impresses itself upon the reader's mind is the very original manner in which a striking fact is for the first time brought out—namely, not that legends of saints were so much parodies of Scriptural incidents, but that they were often mere plagiarisms of the acts of distant men, with accretions or exaggerated marvels growing up under the hand of the later writers of such lore.

The tender grace and beautiful language, the glowing, sparkling, yet reverential style of M. Montalembert (who is not so much as mentioned in this volume) will be missed in the tame and somewhat turgid, though painstaking and masculine, investigation into the origin of the legend of St. Kentigern, which forms the staple piece of the volume.

The “doggerel,”—as it is euphemistically called, being, in candid English, coarse and limping—rhymes about St. Theneu, his mother (whom the Glasgow folk have converted into St. Enoch), ought never to have been suffered a place in a volume intended for even limited perusal. The dreary rhapsodies about Arthurian legends might with equal reason have been curtailed or left out. The identification of the “Scottish dialect” of the twelfth century with the “nascent English” of “*Piers Ploughman*” (save the mark) is on a par with the critical faculty thus laboriously set forth. A sneering tone is always repulsive, and it is additionally reprehensible when a dispassionate exposure of idle legends is ably and conclusively made.

Critical inquiry may skip over legends, although in skilful hands even these have yielded up their hidden stores of information; but it seems to be carried to a preposterous state of doubting when the lame conclusion of a lengthy dissertation comes to this: “We”—in the editorial or leading article style—“still deem it to be all but absolutely certain that Kentigern or Mungo did good service as a Christian evangelist in Clydesdale;” the man—the saint—remembered in Cumbria and Strathclyde, from Chester and St. Asaph to Glasgow and Crichton, now.

The whole story of the mother of St. Kentigern is well told, with this one grave abatement. It is a painful and repulsive subject, which should have been dismissed in a few words. In a violent age she was the victim of brutal and sensual violence, and at Culross, afterwards the site of a beautiful Cistercian abbey, became the mother of St. Mungo, “the beloved,” whom St. Serf (*Servanus*) baptized into the church of God. A similar story is connected with the births of St. David and St. Dubricius, bearing a “remarkable family likeness” to its fellow-legend. However, the story of St. Theneu is turned to practical account in order to furnish a reason for the excellence of the fishing grounds at the Isle of May, which even early in the twelfth century were frequented by boats from England, Belgium, and France,—as the finny shoals had followed her boat from Aberlissie, with its unsavoury name (*ostium foetoris*) to the place of her landing. The story of Danae, after all, is beyond a doubt the prototype of the romantic tale. The blunder of Jocelyn of Furness about Kentigern's name being Constantine, and so called from St. Patern (patron of Llanbadarn Vawr) may be traced to the saint's name Cyndeyrn, or to his birthplace, Keredigion (Cardigan). No allusion is made to his direct imitation of St. David's brotherhood at Mynyw; and no explanation is attempted with regard to an apparent difficulty in his names. The fact is that Kentigern (Gaelic), or Cyndeyrn (Cymric), means a head lord, from “ken,” or “ceann” (as in Kenmare or Cantire), and “tigearna,” a word still lingering in the family of Tierney, and nearly preserving its pronunciation. St. Serf, an Irishman, gave him the pet name of Mochua, from the Irish “Mo,” my, and “Cuach,” a cuckoo: and to this day Irish mothers call their children Mochnachin, “my little cuckoo!” Leaving Strathclyde (where he was of the blood royal), owing to persecution, he took

shelter with St. David, when he received a Welsh name of affection, Mwyngu (still in use), which was corrupted into Mungo: it is a compound of “mwyn,” gentle, and “cu,” or “gu,” beloved.

The lives of St. Serf, St. Columba, St. Asaph, St. Conwal, St. Baldred, and St. Palladius, are curtly dismissed in twenty-one pages. The “curious fiction” peculiar to the north of the Tweed, and long since summarily dismissed from ordinary credence, is repeated in a passage full of misapprehension and error:—

“Jocelyn shared that antipathy to the Columban institutions which was all but universal in his time. These were regarded by orthodox Catholics as wholly irregular and unwarranted, lying beyond the canonically authorised channels of grace, and doomed to speedy and utter subversion. That the Culdees, as the coenobitic disciples of Columba came to be called, precipitated [*precipitated*], and in some degree justified, their own suppression, may be true.”

The monastic rule of St. Columba, easily accessible in the work of Dr. Reeves, was observed at Iona, and in numerous monasteries of Scotland. The Register of St. Andrew's shows that the Culdees were married, and in fact secular canons, who when supplanted by regular canons of St. Austin, migrated outside the precinct wall to the Royal collegiate church of St. Mary's, Kirkcubright. In other places they were desired to conform to the new order of things, or suffered quietly to die out. The Culdees were vicars of York Minster and of Armagh; and Dr. Reeves, who is quoted with approbation, may be regarded as a successor of those priests whom Usher remembered at the time when he wrote. The name of Ceilé Dé, or “God's servants,” was adopted as a generic title by some writers for both coenobites (as in the rule of St. Maelruan) and seculars; but the distinction is obvious between the Columban and the Culdee in Scotland. At Wells and Exeter, Giso and Leofric, bishops of Lotharingian descent, endeavoured to supplant the secular by regular canons, probably under the rule of St. Chrodogang, with a common dormitory and refectory, and failed; whereas in Scotland the seculars were replaced by regulars in several cathedral and also collegiate churches. At Iona, an abbey, and the chief home of the Columban monks, disciples of St. Patrick's rule, a Clugniac and not a secular community superseded the original occupants.

Again, the false position adopted by Mr. Rees, that the Welsh monasteries resembled those of Ireland rather than the earlier religious houses of Gaul, has been adopted without consideration. Their constitution was due to St. German, the master of St. Patrick, who was well acquainted with the rule of St. Martin of Tours, and was instrumental in building up the British Church, when oppressed and fallen, in its integrity. The numbers in the Welsh monasteries were doubtless exaggerated, as, for instance, where Bede mentions the death of twelve hundred monks of Bangor Iscoed in the battle of Legacester, or Carlegion, the Saxon Chronicle, without exaggeration, says two hundred priests fell. The patriots who died praying for their countrymen were the

right masters to train up saints. Years after the ruin of the buildings, William of Malmesbury exclaims, "Sunt certe adhuc tot semiruti parietes ecclesiarum, tantae turbae ruinarum quantae vix alibi! These houses, called Ban-chor, "the Great Choirs," contained coenobites—not, as far as we know, monks bound by special vows—students, and labourers. There were large bodies of lay brothers in Ireland at Lismore, Raithin, and Tallaght. The Rule of St. David, given by Ricemarch and Giraldus Cambrensis, mentions labour, reading, prayer and works of charity: no doubt it was the same as that followed at Llantwit, Hennllan, Caerleon, Llanelwy, and Whitchurch. Sulpicius Severus, describing St. Martin's, Tours, the first monastery established in Western Europe, and taken as a model of their imitations by St. German and Patrick, says that many of the "brethren" lived in caves or wattled cells; all things were in common, none could buy or sell—as "most monks" do; the elder prayed, the younger wrote; they seldom went out except to attend church; there was a single meal—wine was never drunk except in sickness; and the use of any daintier habit than camlet was regarded as a crime. Such a rule would admit of vast numbers easily maintained by the imperative labour of their own hands, as Bede has told us. The British name of such establishments was College or Congregation, which was latinized into the very comprehensive term of "minster."

It is, however, satisfactory to find a writer of acute mind classifying the old fable of the "introduction of a canonical episcopate" among "anachronisms and other absurdities;" and so, it is to be hoped, the polemical inventions with regard to the position of Celtic bishops in Iona may be henceforth abandoned and laid in the grave of buried superstitions.

MACKENZIE E. C. WALCOTT.

Dr. Livingstone and the Royal Geographical Society. By William Desborough Cooley. Printed for the Author. (London: Dulau & Co., 1874.)

THERE is no envy, hatred, and malice, and uncharitableness like that of African travellers and geographers toward each other. Mr. Cooley is the first of contemporary English geographical critics; he is the author of several approved works on Geometry; and his contributions to critical geography include *The History of Maritime and Inland Discovery*, *The World Surveyed in the 19th Century*, *The Negroland of the Arabs Examined and Explained* (characterised by the Count Gräberg da Hemsö as "a truly classical work"), and *Inner Africa Laid Open*, the work of an acute scholar of universal geographical learning and true scientific sagacity, which has been the guide book of every African explorer of the passing generation, and must always remain a handbook of the critics of African discovery. Naturally, therefore, anything written by Mr. Cooley is to be received with the greatest consideration and respect. He has rendered eminent services to African exploration; his work on *Inner Africa* marks an era in African discovery; and yet he has been

completely overlooked by public fame, in the continuous outbursts of popular enthusiasm and applause justly excited by the more human interest of the adventures and tales of nine days' wonder of the unbroken succession of interesting and distinguished African travellers of his day. This, although perfectly natural and just, would of course only all the more pre-dispose the students of his works in Mr. Cooley's favour. He would, in fact, enlist their strongest prejudices on his side, and as a scientific geographer he might well have been content to rest his reputation on his books, and on the justice they are sure always to receive from the students of the history of geographical research. But he has not been able to contain himself against the popular African discoverers. They have been but poor creatures, some of them, and yet, however feeble intellectually, and little as his legs may have served geography, any man who has walked across Africa has, after all, done a finer thing than Mr. Cooley seems capable of understanding, or he would not have found the transient popularity of these "walking gentlemen," and the popular neglect of his own enduring scientific services, so very intolerable. They have had their reward, as he is sure to receive his.

But it is the idlest presumption when Mr. Cooley would pretend to drag down Livingstone's hard and honestly-won fame, to exalt himself on its ruins. He cannot see that Livingstone's fame is not based merely on his geographical discoveries, but on the greatness of his moral character and the high purpose of his surprising travels, which were in the truest sense "missionary travels." The reputations of the two men in no way clash, and yet it seems something amazing in Mr. Cooley's eyes that his name should have been eclipsed in Livingstone's national fame. He has indeed received direct provocation from Livingstone, who, in an honest spurt of irritation, described Mr. Cooley—exactly as he has written himself down in his pamphlet—as "an old-arm-chair geographer, who wrote *Inner Africa Laid Open*, and swore to his fancies until he became blue in the face." But nothing could excuse this utterly indefensible pamphlet, attacking in the most libellous terms at once Livingstone, and the Royal Geographical Society and its office-bearers, dead as well as living, and charging the dead with deliberate frauds, without shadow of evidence, or attempted proof of any sort, more than the iteration of slanders as contemptible as they are disgraceful. Except, indeed, for some occasional geographical criticism, the pamphlet is devoid of all interest, and utterly worthless.

Mr. Cooley describes Dr. Livingstone's relations with the Geographical Society as follows:—

"The traveller being completely successful, it appeared to the Royal Geographical Society that their alliance with him would be mutually advantageous. Both sought notoriety, which might be best attained by a joint effort. The one could address the public, play the patron's part, and play it well. The other, as a novice about to appear before the public, and as a Scot, much desired a patron. To rouse the public a moving speech was necessary. The traveller was, therefore, introduced as an extraordinary man, who had done wonders, and had marvellous escapes.

Attention was never fixed on any one point in the history of his achievements. Not a word was said about truth or authenticity. The spirit of enquiry was kept at a distance. As sensation and pathos usually go hand in hand, the President" [Sir R. Murchison] "immediately conceived the warmest friendship for the inimitable traveller; and whenever the merits of the latter were discussed in a tone which showed a tendency to become acutely critical, a soothing silence was soon brought about by the outpouring of heartfelt affection from the chair. To exaltation of this kind; to the incessant puffing of the good, the great, the noble-minded Livingstone, continued for twenty years, and to nothing else, is due the traveller's unparalleled celebrity. He took the present gains derivable from public patronage; the Royal Geographical Society the steady income of popularity" (pp. 19, 20). "At the moment when it was decided" [by the Royal Geographical Society] "to adopt a system of appearances, and nothing was wanted but an actor, or, in theatrical language, a star, David Livingstone, the discoverer of Lake Ngami, rose above the horizon. He seemed to be exactly the man wanted; likely to be easily caught and held fast by patronage; an indefatigable traveller, with the titles also of missionary and philanthropist, and never rising above the level of popularity. Nothing was needed but to cry him up, to trumpet his fame incessantly, suppressing whatever might dim its lustre. Consequently his arrival in this country was, through the influence of the Royal Geographical Society, made a public event, and he was received with an ovation." (P. 26.)

Mr. Cooley is justified in his observations on Livingstone's ignorance of Herodotus and Ptolemy and Aristophanes,—at page 616 of his *Missionary Travels* Livingstone laments the ill fortune of the birds of Africa in having no Aristophanes to give an account of them;—but this is hypercriticism after all, and beside the mark.

Mr. Cooley's relations with the Royal Geographical Society are so notorious that it is unnecessary to follow him through his history of their long-standing quarrel. It may, however, be as well to remark that the popular constitution of the Society is absolutely unavoidable. The few men in London, or the United Kingdom even, who devote themselves to scientific geography could not possibly support the Society, and if it is to exist at all it can only be by making it a popular as well as scientific society. The great fault of the Society, indeed, has been in not resting more on popular support, and daring far more than it has lately hesitatingly ventured to attempt.

Mr. Cooley would seem, in fact, to have taken advantage of the disgust produced by recent circumstances to rush into print to defame Livingstone and the Royal Geographical Society. But Livingstone's fame is based on a broader, deeper, and more enduring foundation than his travels, and will always be cherished by his countrymen, and no detraction can prevail against it, though it may pick holes in his geography.

"On something higher in us than self-love
Who'd lift mankind must build."

It is deplorable, however, that a man of Mr. Cooley's eminence and authority should have been betrayed by mere personal pique into the publication of this malicious and stupid attack on Livingstone and the Geographical Society. It cannot injure Mr. Cooley's scientific reputation, but it must

always remain in evidence of his unhappy temper, the failings of which it will now be more easy to forgive than forget. The publication of this pamphlet is something graver, indeed, than an indiscretion of temper, or may prove so in its consequences. The slave trade, baulked for a time by the efforts of Wilberforce and Clarkson, is again raising its head. The noble and heroic example of Livingstone has revived somewhat tardily and languidly the old anti-slavery spirit throughout the country; and the great slave capitalists, seeing their danger from afar, will not fail to take advantage of this unscrupulous and malignant attempt to degrade the memory of our greatest traveller—but greater still as the martyr apostle of African freedom—and to break down the influence of a Society which, whilst it has ever shown a true devotion to geographical science, subserves a yet higher purpose than its own, in bringing into the light the dark places of the earth. Jealous for Livingstone, and for the reputation of the Geographical Society, it is necessary to be doubly jealous for the work for which he dared and endured and died.

GEORGE BIRDWOOD.

The National Inheritance. By James Walker. (London: Frederick Farrar, 1874.)

Limited Ownership of Land. Remarks on the Report of the Committee of the House of Lords on Improvement of Land, 1873. By William Fowler. (London: Cassell, Petter & Galpin, 1874.)

THESE two pamphlets on the land question have a good deal in common. Both advocate the abolition of the law of settlement and the custom of primogeniture. Both think the present system radically bad, and both point out remedies for the case. But it is in the remedies that the two writers differ. Mr. Walker has no hesitation: he regards the landowner as "a public pensioner of the most objectionable form," that it is necessary to revert to the first principles of equity, and require the whole of the land to be restored to the Government as national property; that "there is no need of violence on the part of thirty odd millions of people towards 150,000 or 170,000 landlords;" that "the landlords must be dispossessed;" and he concludes by telling us that "the time is coming when individual landlordism will be put into the same category as slaveholding." After this we should advise those fortunate (or unfortunate) persons who hold land at once to sell it, or the time may come when they will be dispossessed. We are not aware what Mr. Walker's knowledge of the past may be; it is a subject upon which persons who speak so very confidently of the future are usually rather hazy. But we may remind him that when slaveholding was abolished this country paid the slaveholders twenty millions as compensation for the loss of their property, and as we presume Mr. Walker pays taxes, he still has the pleasure of contributing to that great act of justice. If the landlords are to be put on the same footing as slave owners and bought out, will Mr. Walker be ready to pay an additional income tax for the purpose?

Mr. Fowler, of course, does not speak out so plainly. Having sat for Cambridge in the House of Commons for five years, he has learnt that it is idle to put forward views like those of Mr. Walker. He still respects private property even in real estate, but asks for "the abolition of life tenures of land as operating to the discouragement of improvement," and "for the minimum of interference with the maximum of freedom in our laws as to the tenure of land." His pamphlet is a review of a report of a Committee of the House of Lords of the Session of 1873 on the Improvement of Land. This Committee Mr. Fowler regards as

"an important epoch in the history of what is known as the Land Question. The appointment of the Committee was moved by the Marquis of Salisbury, a typical, or rather the typical, modern Tory—a man of vast property as well as great intelligence, and he presided over the Committee during its sittings with much assiduity. Such a motion by such a man seems to imply that the owners of land are not satisfied with the law as it stands."

Mr. Fowler then proceeds to state what has been done, under the powers given by various statutes to the Enclosure Commissioners and the Land Companies, to lend money to limited owners of land for permanent improvement to their estates, and he quotes the second section of the report as fairly stating the present position of the matter:—

"The case for Parliamentary consideration lies in this, that the improvement of land, in its effect upon the price of food and upon the dwellings of the poor, is a matter of public interest; but that as an investment it is not sufficiently lucrative to offer much attraction to capital, and that, therefore, even slight difficulties have a powerful influence in arresting it."

The report goes on to state that a landowner

"is led to improve his land more by solicitude for his descendants than by hope of present gain; but the prohibition of settlement would make the solicitude idle. It would, therefore, remove one of the chief motives by which improvements of land are now dictated."

To this passage Mr. Fowler takes great exception. He says it contains two propositions: (1) that the chief motive which impels men to improve land is solicitude for their descendants, not care for their own interests; and (2) that an owner in fee, without power of entailing his land, cannot, or will not, act on the motive so described. Both these propositions Mr. Fowler denies. According to him a limited owner is a far more selfish person than the House of Lords represents him to be; he has, to use Mr. Fowler's words, in "too many cases a solicitude rather to injure than to benefit the next taker;" and he thinks that if the class who buy land with the object of founding families could be got rid of, the result would be a beneficial one to the country.

Mr. Fowler being so far at issue with the committee in their statement of the question, can hardly be expected to agree with their conclusions. Their main conclusions are two: (1) that limited owners, with the consent of trustees, may spend trust money on the improvement of their estates on redeemable mortgages; and (2) that limited owners may charge their estates with improvements,

the charge to be redeemable within a period exceeding by ten years the owner's expectation of life, but the term not to be less than twenty-five, nor more than forty years.

These conclusions Mr. Fowler describes "as utterly insufficient and illusory, as not grappling with the real cause of the mischief. He is not prepared to accept any such "mere palliatives," but thinks nothing short of a fundamental change in the land laws will be sufficient to meet the evil. The fundamental change proposed is to abolish settlements, abolish life estates, abolish limited owners, and make every landowner tenant in fee-simple. This certainly would be a fundamental change, as it would alter the tenure of at least a third of the country. But if Mr. Fowler is logical, he must not stop here. Settlements are not confined to real estate; it is not in land alone that life interests are found. Settlements of personality must also be abolished; life interests in money must share the same fate as life interests in land. A man must be the unlimited owner of all his property. What the result of such a system would be Mr. Fowler does not tell us, nor does he bring forward any arguments to justify so great a change in the law and in the habits of the people. He tells us that the habits that give rise to settlements—i. e., the habit of providing for families—are bad, and the feelings that sanction them erroneous; and we cannot make too much haste in getting rid of both. But before we do so, we should like to know what Mr. Fowler proposes as a substitute. How is a man to provide for his children and descendants? Nothing is easier than to destroy; nothing is harder than to reconstruct; and before giving up the existing system, we are curious to see the details of the one that is to be substituted for it. There is one remark in Mr. Fowler's book which in his dealings with the land laws it would be well if he would lay to heart: "Courage is needed to form the character of a skilful healer, provided always that courage do not degenerate through ignorance into rashness."

J. W. WILLIS BUND.

The Dāthāraṇsa; or History of the Tooth-Relic of Gotama Buddha. By M. Coomāra Swāmy, Barrister-at-Law, Lincoln's Inn, Member of the Legislative Council of Ceylon, &c. (London, 1874.)

THE belief in the power of relics has never among the Buddhists reached so absurd a height of superstition as it has among Europeans; for while the Buddhists have imagined that by paying respect to the relics of their great teacher and of his principal disciples they could gain such merit for themselves as would ensure their entry into heaven, they have never hoped by such means to cure bodily disease or ward off earthly disaster; and among the Buddhist relics there are no such objects of worship as the blood of St. Januarius, or the cloth of St. Veronica, or the House of Loretto. Nevertheless, the natural spirit of reverence for the relics of their religious teachers is widely diffused among the Buddhists. At Kandy, in Ceylon, they preserve the supposed left eye-tooth of Gautama Buddha, at

Wēruwā-wila, in the same island, is another of his teeth, and at Amarapura, in Burmah, is a third. A lock of his hair and his left collar-bone are said to be buried under Mahiyangana Dāgaba; his right collar-bone, the dish from which he usually ate, and some of the ashes of his body under Thūpārāma Dāgaba, in Anurādhapura; one-eighth of the ashes of his body under the Ruwanwaeli Dāgaba in the same city; and a minute portion of his ashes under the dāgaba of almost every Buddhist vihāra in Ceylon. In the north of India there are dāgabas said to be erected over the remains of some of his principal disciples; and at Mihintale the relics of the great apostle Mahendra, the St. Augustine of Ceylon, are preserved with reverent care.

There is no historical evidence of the genuineness of any of these relics of Buddha; but one of them, the supposed left eye-tooth at Kandy, has a very remarkable history, and forms the subject of two ancient works, one in Elu and the other in Pali; the latter of which has just been edited by Sir M. Coomāra Swāmy, with an English translation and notes.

The Elu work, which is called *Dala-dāvamsa*, i.e., dāthā-dhātu-vamsa, is believed by Turnour to have been written about 310 A.D., when the tooth-relic was first brought to Ceylon from Dantapura in India; and it must have been composed some time before the end of the fifth century, since it is mentioned in the thirty-seventh chapter of the *Mahāvamsa*, which work was composed between 459 and 477 A.D. For a long time the *Daladāvamsa* was regarded as the great authority on the subject, but in the reign of Parakkama the Great's widow Līlāvati, who reigned A.D. 1202-1205, and again 1215-1216, the same fate befel the *Dala-dāvamsa* as had previously befallen the Sinhalese chronicles of Ceylon, and the Sinhalese commentaries on the Tripitaka—it was rewritten in Pali. The Elu chronicles and the Elu commentaries have unfortunately completely disappeared; but according to Turnour the *Daladāvamsa* was still extant in Ceylon in 1837.

Of the Pali work, Turnour has given a very full analysis in the *Journal of the Bengal Asiatic Society* for 1837, from which it appears that its author Dhammakitti Thera* prefixed to his book a preface, not found in the edition before us, in which he lays down his reasons for undertaking the task of translation. These are: 1. That the *Mahāvamsa*, merely referring to the *Daladāvamsa*, says almost nothing about the relic. 2. That the *Daladāvamsa* is too long, being full of details about the death of Buddha,† and the history of the relic immediately after that event; and 3. That the Elu language, in which the *Daladāvamsa* is written, is hard for the Sinhalese to understand. In the poem itself (Canto 1. v. of the edition before us) he adds a fourth, viz., "for the benefit of those who live in other lands."

From this work, which is confirmed by the *Mahāvamsa*—the *Dipavamsa* unfortunately

ends just before these events took place—we learn that the relic was brought to Ceylon by a prince Dantakumāra, and his wife a princess Hemamālā, who represented themselves to be the daughter and son-in-law of a King Guhasiha of Dantapura in Kalinga. The story they told of the tooth occupies the first four cantos of the work before us, and relates that a priest named Khema abstracted the tooth from Buddha's funeral pile, whilst the chiefs of the surrounding countries were quarrelling for the possession of the relics. It would be interesting to know whether there is any mention of this in the *Mahāparinibbāna-Sutta*. Though the fact would, if true, be very important from the Buddhist point of view, it is passed over in silence in the long account of Buddha's death in the *Thūpa-vamsa*—an ancient Elu work on the most famous Buddhist dāgabas or bell-shaped relic shrines.

Khema gave the tooth to Brahmadata, King of Dantapura, whose son and grandson, Kāsi and Sunanda, greatly honoured the relic. Then comes a fatal gap of seven or eight hundred years in the history, after which we find Guhasiha reigning in Dantapura, but apparently ignorant of the very existence of the tooth, after which his capital is named. One day, seeing a great festival going on in the city, and enquiring what it meant, he was informed by a Buddhist minister that the people were worshipping the relic of Buddha which Khema had brought there. Thereupon, the king "renounced the filth of heresy," and became a convert to Buddhism, and expelled the Hindu devotees called in the *Dāthāvamsa* Nigaṇṭhas. This happened about 290 A.D.

The latter went to the court of the suzerain, at Pātaliputra, whose name (probably only his family name), was Pandu, and complained to him that whilst he worshipped the true gods Siva, Brahma, and others, his subject Guhasiha in Dantapura worshipped the bone of a dead body. Pandu accordingly sent Chittayāna, at the head of a large army, to bring Guhasiha and the tooth to him; but Guhasiha received him amicably, and showed him the tooth, which, by working a miracle, converted Chittayāna to Buddhism; and when it was shown to Pandu, worked further miracles and converted him. Guhasiha subsequently returned home in triumph, but was shortly after besieged in his capital by the nephews of a king Khiradhāra, whom Pandu had defeated and slain.

Seeing that the struggle was hopeless, Guhasiha gave the tooth in charge to Dantakumāra, his son-in-law, telling him to escape to Ceylon, and then leading his troops out against the enemy, fell in battle, the prince and princess escaping in safety with the relic, which they brought to Ceylon as related above.

From the time of its arrival in Ceylon in 310 A.D., the tooth has been frequently mentioned in trustworthy historical records. Dhātusena (A.D. 459-477) made a jewelled casket for it; his grandson Moggallāna the First took it for a short time out of the hands of the priests, as a punishment for their treason against his father. Parakkama the Great built for it a beautiful little temple, still extant at Pukastipura, the exquisite workmanship of which has astonished all

who have seen it. Vijayabāhu III. enshrined it at Dambadeniya about A.D. 1240; Bhuvanekabāhu I. took it to Yāpahu, whence it was carried off to Pāndi, in South India, by Āryacakravarti, a Tamil general, about A.D. 1310; the next king of Ceylon went to Pāndi in person, and brought it back with great pomp, and his son established it, A.D. 1319, at Hasti-selapura. It continued to be, next to the sacred Bo Tree at Anurādhapura, the most venerated object in Ceylon, when, in A.D. 1560, the Buddhist world was startled by hearing that the Archbishop of Goa had destroyed it.

When the Portuguese in that year took Jaffna, there was brought to them out of the spoils of the principal temple a tooth mounted in gold, which they were told was a tooth of Buddha. The King of Pegu hearing of this through a Portuguese captain trading in Pegu, sent in anxious haste to redeem it on any terms the Portuguese should demand. The priests in Goa, however, with the archbishop at their head, opposed this "traffic in idols" as impious; their piety was, as they thought, triumphant, and the idol was pounded to dust in a mortar, then burnt, and its ashes scattered in the river. All the priests signed a resolution on the occasion, "a copy of which," writes Diego de Conto, the historian of the Portuguese in Asia, "is now in our possession in the record office."

As soon, however, as the King of Kandy heard of this, he declared that the true tooth was still in his possession; and there can be but little doubt that the Portuguese had been imposed upon. Jaffna was always an outlying and unimportant part of the Ceylon kingdom, not often under the power of the Sinhalese monarchs; and for sometime before this it had been ruled by a petty chieftain; there is no mention of the tooth brought by Dantakumāra having been taken there; an event so unlikely and of such importance, that it would certainly be mentioned had it really occurred. We have every reason to believe, therefore, that the very tooth referred to in the work edited by Sir Coomāra Swāmy is preserved to this day in Kandy. It may not be generally known that for more than nine years the relic was in the official custody of Mr. Turnour, the Colebrooke of Buddhist savans; the keys of the sanctuary being never absent from his library, save during the performance of the daily offerings.

The text now published by Sir Coomāra Swāmy was printed at Colombo in the Sinhalese character; it is extremely accurate, and the translation throughout is close and faithful. For 2,000 years the Tamils have been the hereditary foes of the Sinhalese; and it is an interesting result of the Pax Britannica which has worked so many changes in India, that we should receive a careful edition of a Sinhalese classic from the pen of a Tamil gentleman. Historically, the *Dāthāvamsa* is only of value so far as it may be regarded as reproducing the statements of the *Daladāvamsa*, and then only for the period from 290 to 310 A.D., during the life of Dantakumāra: philologically the value of a Pali text of so late a date must decrease as the older Pali works are edited; but the *Dāthāvamsa* will always remain a model of neat and elegant composition, and of really beautiful versification.

* Erroneously called by Turnour, *loc. cit.* p. 859, Dhammarakkhita.

† Professor Childers is now publishing the sūtra from the Tripitaka, which gives an account of the death of Buddha.

It is to be regretted that the interesting history of the tooth has not been more thoroughly discussed in the Introduction; but we trust that the success of this work will encourage the learned editor to further labour in this field. T. W. RHYS DAVIDS.

Supernatural Religion: an Inquiry into the Reality of Divine Revelation. In Two Volumes. (London: Longmans & Co. 1874.)

Ditto, Second Edition. 1874.

(Concluding Notice.)

ABOUT a quarter of the Second Part is taken up with the examination of Justin's Gospel references; next to this, the most important chapters are those on Papias and on Marcion. The chapter on Hegesippus only comes to the very probable conclusion that he knew no Gospel but that according to the Hebrews, and that this, perhaps, rather than the authentic form of our Luke, was the original source of Luke xxiii. 34,—the words said to have been repeated by St. James at his martyrdom. Of most of the other second century writers, both Orthodox and Gnostic, the conclusion reached—indeed the only one possible—is that they had before them written Gospels cognate with ours, but that it cannot be proved that they either were or were not identical with them. As regards some we have no evidence at all—as regards others we have so little as to be consistent with almost any conclusion. But Papias and Marcion do bear witness to the existence of Gospels bearing the names of Matthew and Mark, and of one at least closely cognate to our Luke, and so repay examination—if the origin and date of our Gospels, and not their substantial veracity, be regarded as the question at issue.

Of Papias, however, one cannot say much, because our evidence, though not irrelevant, is so painfully scanty. We have two or three sentences of his own preserved—with one exception, too short to prove much; even that one is ambiguous, because we cannot judge the character of the whole. If a sensible writer of a critical age had used his language about "the living and abiding voice," it might be fair to conclude that he deliberately "prefers tradition," "which he considered more authentic," "to any written works with which he was acquainted." But if we accept Eusebius' judgment that Papias, though pious, and in a way studious, was very stupid—a man, probably, of much the same intellectual calibre as the extant pseudo-Barnabas, or an exaggeration of the weaker side of Irenaeus—the passage may bear quite as well another significance. To Papias himself intercourse with the Elders was more edifying than reading of books, and seemed to bring him into closer communion with the Lord and his Apostles; he forgot that what was "the living voice" to him would be dead writing, and not even first-hand writing, to his readers. Again, where he describes his Matthew and Mark, though his language is not what we should have applied to our Gospels of those names, one cannot be certain that he does not refer to them. Many of the shorter *λόγια* in our Matthew would require a statement of their

occasion to make them intelligible, and thus the statement that the real Matthew's work was a collection of *λόγια* does not exclude, so completely as it has been fashionable to assume, the possibility of its having included a skeleton narrative like ours. And Papias' statement that "everyone translated them as he could" from Hebrew into Greek, while it almost precludes our identifying our Greek Gospel with the Apostle's original work, is quite consistent with its being *bond fide* based on it and embodying it; the translators had, Papias probably means, rewritten the book, but not falsified it. And if Matthew, as known to Papias, gave any continuous narrative such as our Matthew does, the fact that Mark's order of events and discourses was not exactly the same as his was quite sufficient reason for his declaring that Mark observed no chronological order at all.

As to Marcion and the connexion of his Gospel with that ascribed to Luke among the orthodox, our author gives us a fair *résumé* of the various opinions that have been held, and a sketch of the evidence for each: the almost unavoidable conclusion is, that the evidence is insufficient to establish any opinion at all. And of most of the other heretics of the second century, the little we know is altogether irrelevant to the matter in hand. It can only be affirmed that there seems to have been a certain agreement between them and the orthodox as to the existence of genuine records of Christ's doctrine: which records were the most trustworthy, and which was to be preferred among variant forms of the same, both sides seem to have decided on dogmatic rather than on critical grounds. The only thing to be said is, that the dogmatic preferences of the heretics seem to have been the more opposed of the two to sound criticism—it is certain that the authors, whoever they were and whatever they taught, of a saying like Matt. xi. 27, did not mean to teach dualism, or to deny the divinity of the Jewish Law.

In the particular case of Tatian, however, the evidence does seem to converge to one conclusion—viz., that he knew the canonical Gospels, though he preferred that according to the Hebrews (whether on dogmatic grounds or on critical)—that he made it the basis of a Harmony, but that he incorporated most of their substance into it. This view our author does not mention, and prefers to treat Tatian, like his contemporaries, as proving nothing whatever. He greatly overstates the vagueness of Eusebius' evidence about his Diatessaron: the sentence would be much better translated "having composed in some sort of way a kind of amalgamation," &c.; the parenthetical *ὡς οἱ ἄλλοι ὁπώρας* is by no means an admission of the writer's ignorance regarding the contents of the book, but at most an admission that he was puzzled as to its principle of composition. It is scarcely possible that the compiler of the "Canons" should have neglected to consult a book of the kind which he declares to be "current," i.e. probably almost canonical, in some places, and which continued so a century later; if anything is to be made of the phrase it may be taken to express a doubt whether it was framed from the canonical Synoptics only, or how its deviations from them (after the

Gospel of the Hebrews) were to be accounted for.

So far, however, the author makes out—if not his main case, that the supernatural events of the Gospel narrative are without sufficient evidence, yet—that the literary evidence on which the early Christians believed that narrative was not absolutely identical with the literary evidence now extant and alleged in support of the same belief. But there is something arbitrary in the way that he breaks off his discussion just at the point where the balance of evidence begins to turn against him. He often asserts, but never proves, that the Christians of this period had no notion of a New Testament Canon, co-ordinate with that of the Old Testament; but the Christians of the next period had the notion, and it is incredible that it should have started into being in a moment. If Papias and Polycarp, Justin and Tatian and Melito, called nothing "Scripture" but the Old Testament, how comes it that Irenaeus, the writer of the Muratorian fragment, and Tertullian did? not to mention the perhaps earlier writer of Peter II. iii. 16. To come nearer to the special question in hand: St. Irenaeus was strongly convinced, that there were and must be, in the eternal fitness of things, four Gospels, neither more nor less: now it is surely incredible, that this notion was really derived from his arguments about the *καθολικὰ πνεύματα*. We must believe that he did find these four canonical in a sense that no others were; and though he was no critic competent to estimate the value of the fact, he is a witness competent to prove the fact, for subsequent critics to estimate.

Irenaeus introduces naturally the subject of the Fourth Gospel; of which, as already intimated, our author's treatment is far from satisfactory. For one thing, we have here a still less excusable reproduction of the same fallacy as before—the assumption that the chance of authenticity of our Gospel is diminished instead of increased, if the fact or sayings recorded in it, and quoted by other writers of known date, were derived by them from an independent source. As regards the Synoptics, we know that they are members of a cycle: the possibility cannot be excluded that quotations, even verbally coincident with some of them, may be derived not from them but from lost members of the same cycle, whether this be of historical importance or not. But we have no evidence at all of a cycle of Gospels cognate with our John. The Gospel according to the Egyptians is a possible exception: the two works had one feature in common, viz., that sayings of Jesus are introduced as replies to questions of disciples whose names are given, and that Judas is, long before the actual betrayal, denounced more or less covertly by his Master. But the character of the answers thus introduced is as different as possible; it is no matter of theological prejudice, but the most rudimentary literary instinct can distinguish between the tone of the saying to Thomas about the Way, the Truth, and the Life, and the saying to Salome about the Male and the Female. If there be any relation at all between the two, it can only be that between a masterpiece, and a caricature meant for a

copy. Moreover, what slight evidence we have as to the general character of the Egyptian Gospel seems to affiliate it to the Synoptics; it was perhaps identical with that according to Peter, perhaps a variant form of that according to the Hebrews; in neither case can it have been so anti-Judaistic as our John. But, as before, if Justin and pseudo-Clement got their version of the requirement of regeneration, or the latter (as is less credible) his account of the man that was born blind, not from our John, but from some other Gospel which they considered authentic—what then? The presumption that our John is a forgery, to say the least, is diminished inasmuch as it is shown that the writer's statements are not unsupported; the evidence for his date and personality is left just where it was; in short, his credit will if anything have gained a little; though, in the case of a work ascribed to a definite author, perhaps rather less than it might have gained from a direct citation.

No doubt it is remarkable, that Justin makes so few references to St. John in proportion to those to the Synoptics or works cognate with them; and the author was fully justified in calling attention to this fact. If the discourse to Nicodemus be a version of a real saying of Jesus, it is a quite possible though rather arbitrary hypothesis, that St. Justin was unacquainted with our Fourth Gospel, but derived this and other passages from another source; while his doctrine of the Logos, in any case, is no doubt a statement of the common views of Christian thinkers, rather than Justin's individual deduction from an individual text. But on this last subject our author is really intolerably inconsistent. There is, of course, a *prima facie* case for the view, that the Fourth Gospel contains a different doctrine of the Person of Christ from that of the rest of the New Testament: the name Logos, at any rate, occurs nowhere but in this Gospel and in the Revelation. Now this doctrinal discrepancy, if real, is an argument of some weight against the apostolic date of the book; and if the author is convinced of the discrepancy, we cannot be surprised at his using this argument against the date. But then he turns round and tells us that anyone whose doctrine coincides with that of St. John's Gospel may have derived it, not from it, but from "early New Testament writings," as well as from "Philo or the Old Testament," *e. g.*, from St. Paul* and the Epistle to the Hebrews, or from the Revelation, the undoubted work of St. John himself. To be sure, he tries to make out that Justin's doctrine is different from that of the Gospel, but only by putting very great force on the assumption that the latter is the same as that of the Athanasian Creed, without even such checks as St. Athanasius would have allowed. If "Justin and Philo apply the term *θεός* to the Logos without the article," our John in his very first verse does exactly the same—though in neither case, perhaps, has the fact any reason but a grammatical one. At any rate, "the ascription to the Logos of the name Apostle"

is anything but "opposed to the Fourth Gospel" (see xx. 21).

But the witness of Justin to the Fourth Gospel is, no doubt, far less clear than that of Irenaeus; and the question of its external attestation really depends mainly on the value we ascribe to the tradition reaching the latter through Polycarp. As to the extent of direct intercourse between the two, our author extenuates it rather too much. Irenaeus claims to have a vivid personal recollection of him, and proves it by reproducing his little tricks of language (*ὡ καλὲ θεέ*). Perhaps the most that one can say is, that whether St. Polycarp had known St. John or not, St. Irenaeus was perfectly well able to ascertain the true state of the case; if Polycarp was really the disciple, not of John the Apostle, but of John the Presbyter, Irenaeus made a blunder that proves him, not merely uncritical which he was, but stupid to an extent that we have no reason for thinking him to have been.

But here also we have arguments which may support either of two views adduced to support both; though here the author is not responsible for originating the attempt. The Quartodeciman observance of Easter may or may not imply a scheme of dates in the story of the Passion inconsistent with the Fourth Gospel; * but this throws no light on the authorship, unless the observance can be traced to St. John. One of the most certain facts of ecclesiastical history before Irenaeus is Polycarp's attitude on this question; his visit to Rome, and his honourable reception there, were public facts, noticed and noticeable by the whole Church, east and west. Now if Polycarp learnt his practice from the Apostle John, we have a check of incalculable value on the falsification of Christian tradition, still more on the ascription of spurious works to that Apostle. Two long lives, both spent in public stations, under the eye of friends and foes, and both retaining full intellectual vigour to the last, cover the period from the Crucifixion to the date when continuous Church history may be said to begin. It is difficult to avoid thinking that if this was so, the beliefs generally current among those inheriting this tradition would in the main be authentic, even though they did not investigate the grounds of their belief minutely, and though we have not the means for determining what those grounds were.

The external evidence, therefore, must be admitted to have a certain value; it is not to be set aside, at any rate, by *à priori* psychological considerations. Perhaps the Gospel is not what we should have expected from the fisherman of Galilee, the *ἀνθρώπος ἀγρόματος καὶ ἰδιώτης*; but then there is no saying what we ought to have expected. It is a matter of controversy how far Greek was colloquially current in Palestine: but let St. John have been a Hebrew of the Hebrews, and yet we can prove nothing from the fact. If Hobbes or Landor had had occasion to learn a new language at sixty, the former at least would in a twelvemonth have written in it "with a great deal of courage," and

either would have been quite capable of composing in it up to ninety with vigour and fair correctness. It may be added that the life so prolonged is described as a saintly one but by no means ascetic, and not of exhausting physical activity.

Again, our author tries to show that John was morally, as well as intellectually, incapable of producing such a work as our Fourth Gospel. Now, whether he stood to Jesus in the intimate relation described in this Gospel, the certain fact that Jesus chose him as an Apostle—probably at a very early age, if the Irenaeus tradition be worth anything—is a testimony of some weight to his spiritual character. Whatever may be said of Mark x. 35 sqq., the only light thrown upon John's character by Luke ix. 49 is, not that he was more eager than the other eleven in forbidding the exorcist, but that he was more prompt in apprehending that his Master would not approve of their doing so. But the writer really refutes these arguments himself, by his own inconsistencies; in one place he tells us that in the Gospel "instead of the fierce and intolerant temper of the Son of thunder, we find a spirit breathing forth nothing but gentleness and love;" in another, that for the "teaching of sublime morality" unfolded by the Synoptics, "the fourth Gospel substitutes a scheme of dogmatic theology of which the others know nothing," and in fact complains that it overclouds the charity of Christ's teaching with a system of intolerant orthodoxy. Orthodox Christians, of course, regard zeal for orthodoxy as quite compatible with Christian charity: if wrong, they may possibly be refuted *à priori*, but till they are, they will be well content to find the co-existence of the two in the Evangelist's mind proved by internal evidence, and to accept the external evidence that he learnt the combination from his Master, and that only by degrees.

Something, but not very much, is made of the argument from the ignorance and lack of sympathy for Jewish ways shown in the Gospel. Want of sympathy, indeed, is too vague a ground to build upon—admitting that the writer of the Apocalypse had the national and (in part) the religious feelings of a Jew, it is impossible to say how far they might be obliterated in the course of twenty years from the destruction of Jewish nationality, and of twenty years' conflict with Jewish religionists. As to the argument from ignorance, it is only to be remembered that a little positive evidence one way balances a great deal of negative the other. In the present state of our knowledge of the topography of Palestine, we cannot certainly identify Sychar or Bethany beyond Jordan: but it is scarcely safe to assume that there never were such places, when we remember that Capernaum is not certainly identified either. The Evangelist knew a good deal about the country that is demonstrably true: this has to be taken into account, before assuming that his *prima facie* errors are real ones.

Altogether the book, as an argumentative essay, must be pronounced a failure: its utility lies in its collecting and popularising a mass of evidence which almost everyone who has the knowledge and the patience to read it would be as competent to estimate and

* He follows the A. V. in his interpretation, not only of Rom. ix. 5, but of Phil. ii. 6, with a merely verbal difference in the latter passage.

* The writer of the Martyrdom of Polycarp clearly sees a "Conformity" close enough to be edifying in the betrayal of the Saint on Good Friday, and his death on Easter Eve.

make deductions from as the author. Controversy is so decidedly the writer's primary object, that it has been seldom possible to discuss his success except by adopting a controversial tone, and resting the estimate formed on his work on the possibility of reply to his arguments. Whether it is proved or no that our Gospels are not (in their original form, allowing for accidental corruption and interpolation) the work of those whose names they bear—at least he has not proved it.

WILLIAM HENRY SIMCOX.

MINOR SCIENTIFIC BOOKS.

Science Primers. Edited by Professors Huxley, Roscoe, and Balfour Stewart. (London: Macmillan & Co., 1874.) :—

Chemistry. By Professor Roscoe, F.R.S.

Physics. By Professor Balfour Stewart, F.R.S.

Physical Geography. By Professor Geikie, F.R.S.

Geology. By Professor Geikie, F.R.S.

Physiology. By Michael Foster, M.A., M.D., F.R.S., Fellow of Trinity College, Cambridge.

THE publishers of this series of primers have done much to further the progress of science-teaching, by providing text-books which range from the highest requirements of the university student to the capacity of the classes in our primary schools. We pass from the mighty mathematical works of Thomson, Tait, and Clerk-Maxwell, through the Clarendon Press Series, and the Elementary Class-book Series, to these Primers of Science. The latter are compact little books in limp covers, containing illustrations, and about a hundred pages of text. They are all by men eminent in their several branches of science. The Introductory Primer, by Professor Huxley, which presumably will treat of the modes and methods of science-teaching, and of the advantages of a knowledge of science, has not yet appeared; but we trust that its publication will no longer be delayed, as without doubt it will form one of the most valuable works of the series.

Professor Roscoe commences his *Chemistry* by discussing the nature of the four ancient elements—earth, air, fire, and water. This arrangement involves an account of many of the commoner elements, and if earth were fully described would, of course, involve an account of all the elements. Simple every-day matters are described from a chemical point of view: the burning of a candle, the slaking of lime, breathing, the action of plants on the air, and so on. The composition of water is demonstrated, and this leads to a description of the nature and properties of hydrogen, and a quantitative experiment (p. 32) to demonstrate the precise composition of water by weight. Towards the end of the book we find a list of elements, and an account of chlorine, the oxides of nitrogen, and a few familiar metals.

The primer of *Physics*, by Professor Balfour Stewart, is a most comprehensive little book: it includes heat, light, electricity, magnetism, and an account of the mechanical properties of solids, liquids, and gases. The experiments are for the most part clear and conclusive, and a special set of apparatus, as in the case of the chemistry, is supplied to illustrate the propositions.

It is satisfactory to find that the study of physical geography is becoming more general in schools. Fifteen years ago it was scarcely taught at all, now it is a subject of study in many of our larger schools. Professor Geikie's primer will be useful for giving initiatory ideas. After discussing the shape of the earth, its relations with the sun and moon, and its rotation and revolution, he passes on to the air considered from a meteorological point of view, then the circulation of water on the land, and an account of the sea, terminating with a description of volcanic action. The primer of *Geology* by the same author gives

a popular exposition of the main points of the science, and is a very readable and interesting little treatise. Both works are capitally illustrated.

Professor Michael Foster's *Primer of Physiology* is a fitting introduction to Professor Huxley's *Lessons on Elementary Physiology*. The work is divided into ten chapters, and gives us in a concise form the principal facts connected with the circulation of the blood, respiration, digestion, and the mechanism of bodily movement. The illustrations are good, and fully fulfil their object: we would specially draw attention to fig. 4, which represents the red and white corpuscles of the blood magnified; and to fig. 15, a section of the skin highly magnified, showing the position of a small skin artery and capillaries. The book, written by a master of his art, seems to us to leave nothing to be desired as an elementary text-book, and indeed as an introduction to physiology, whether for the schoolboy or the incipient medical student before commencing hospital life.

Each of these works contains sufficient matter for regular school study of three or four hours a week for half a year—in the case of the *Physics Primer* for a year. They are beyond the most elementary schools, and can be used with advantage in fourth forms in our larger schools. We wonder whether the authors, who have to deal with men in their science-teaching rather than boys, recognise the extreme difficulty of getting young boys to grasp a scientific idea. Much of the matter in the two first of these primers would require to be studied and explained three or four times in succession before it would be finally grasped. Take the law of Archimedes and its verification (*Physics Primer*, pp. 28, 29), which seems so easy to us who are always talking about it; to a young boy to whom the very mode of thought is new and unknown, it presents great difficulties. It requires to be repeated many times before it is comprehended. After an hour's patient explanation and illustration of the law, both pure and simple and applied, if you ask the Pore whether Hiero's adulterated crown displaced more water or less water than an equal weight of pure gold, half the boys will say "less." Again, the proof of the composition of water by synthesis (*Chemistry Primer*, pp. 30, 31, 32), presents extreme difficulties to the learner. It ought not, we know; but we are too apt to forget that boys for the most part begin the study of science when their ideas on other subjects of study are more or less developed, and the attitude of mind requisite for this new study differs so entirely from that which they have hitherto adopted, that it is by no means easily acquired. We shall be very glad when we see this capital series of primers in general use throughout our primary schools, and so used that the greater part of the matter which they contain can be readily assimilated by the learners.

Elements of Zoology: for Schools and Science Classes. By M. Harbison, Head Master, Model-school, Newtownards. 8vo. 172 pages. (London and Glasgow: William Collins, Sons, & Co. 1874.)

The Student's Guide to Zoology: a Manual of the Principles of Zoological Science. By Andrew Wilson, Lecturer on Natural History, Edinburgh. (London: John Churchill, 1874.)

THE first of these works treats mainly of the lower divisions and lower sub-kingdoms of animal life. One chapter of twenty-six pages is devoted to the Vertebrata, while the others discuss Annulosa and Annuloida; Mollusca and Molluscoida; Coelenterata and Protozoa. A useful glossary of terms is found at the end of the book. At the outset a broad distinction is drawn between inorganic and organic bodies in the following passage:—

"Inorganic bodies are either indefinite in shape (*amorphous*) or assume regular forms called 'crystals,' which are bounded by plane surfaces and straight

lines. Organic bodies are generally definite in shape, and are bounded by curved lines and rounded surfaces. Inorganic bodies increase in size by the addition of similar particles to the outside. Organic bodies grow by the receiving and assimilation of matter into the interior."

We should prefer to have seen the introduction of certain other and equally or more important distinctions; for example, inorganic matter may be composed of any one or more of the sixty-four elementary bodies; organic matter is almost invariably made up of four elements—carbon, hydrogen, oxygen, and nitrogen, and invariably contains carbon. The latter class of bodies are formed in the organisms of plants and animals, the former by nature; in fact it becomes the old division of the mineral kingdom on the one hand, and the vegetable and animal kingdom on the other. Again, the "regular forms of inorganic bodies are not always bounded by plane surfaces and straight lines," and there are some essentially organic substances formed by plants and animals which are so bounded.

The author divides the Animal Kingdom (after Huxley) into seven sub-kingdoms commencing with mammalia, and ending with protozoa. The former sub-kingdom commences with man, and the latter ends with gregarinida—parasites which infest the alimentary canal of earthworms and cockroaches. The intervening chapters are filled with an account of each special sub-kingdom. Sets of questions are given at the end of each chapter. The book is written in a very clear, readable style, and is, we think, well adapted for use in schools. It is capitally illustrated, many of the illustrations being borrowed from the *Éléments de Zoologie* of Gervais. We may specially mention the woodcuts of the *Aurelia*, the anatomy of the *Terebratula*, and of the Oyster, and of the organs of the sea-urchin.

Mr. Wilson's book is rather adapted for the medical student than for school use. We should like to see it more fully illustrated. It is somewhat dry and philosophical, and abundant illustrations would relieve this, and, at the same time, more fully indicate the author's views. The work has the merit of containing all recent matter both theoretical and practical, theories of evolution, and of spontaneous generation, facts concerning deep sea-dredging and its results. The author declares for *biogenesis*—that is the doctrine which asserts that the living organisms found in vegetable infusions are produced from germs or seeds which have floated into the solution, or were before contained in it. The work is carefully written, but we are unable to see that it possesses any special advantage over many of the numerous text-books of zoology which now exist.

Elementary Astronomy for the Use of Schools. By C. C. Reeks. 18mo, 51 pages. (London: Van Voorst, 1873.) This small book consists of a number of terse statements relating to various primary astronomical facts; it is illustrated by a few simple woodcuts, not always accurate (witness Fig. 10), and not always as clear and intelligible as they might be (witness Fig. 8). It does not appear to us to possess any advantages over similar elementary works, such as that of Proctor.

Bibliotheca Nicotiana; a First Catalogue of Books about Tobacco. Collected by William Bragge, F.S.A., Shirle Hill, Sheffield. (Privately printed, 1874.) Probably no plant has been so much written about as tobacco. Considering the late period of its introduction into Europe, the mass of literature connected with it is certainly remarkable. No adequate history or bibliography has yet appeared. The present work, of which fifty copies only have been struck off, records the valuable and extensive series of works on "the Indian weed" collected by Mr. Bragge. It contains 169 articles, the earliest being Oviedo's *Hystoria de las Indias*, 1547, the latest a French *thèse*, printed in 1872.

It is always pleasant to find special collectors who are willing to let us know the treasures they

have accumulated. Mr. Bragge's carefully compiled list opens to view a series of books of the greatest use to whoever may be the future historian of the tobacco plant. In saying this we do not ignore the fact that several praiseworthy essays have already appeared. Mr. Bragge is entitled to the thanks of all who are interested in the records of social customs for this elegantly printed tract.

Building Construction: Timber, Lead, and Iron Work. By R. Scott Burn. This little book with its accompanying volume of plates has, the author tells us in his preface, been prepared to place before the student a statement of the leading points connected with the employment of timber, lead, and iron in the construction of buildings, in such a way that while it explains the technical terms in common use, it should at the same time convey a fair idea of the methods in which these various materials are used and of the forms they assume in practice.

The author has based the plan of the work upon the syllabus of the Government Science and Art Department, so that it may serve as a handbook for those who intend to prepare for the examinations in those branches to which it refers.

The author commences with a description of drawing materials and instruments, and then gives instructions for the drawing to various scales of plans, elevations, and sections.

Almost every kind of work required in a warehouse or private dwelling-house is carefully described and well illustrated by the figures and plates, which are remarkably well executed, rivaling those which we find in the much larger and more expensive books on the subject.

The details contained in the book are of too technical a character to be discussed here at length, but we strongly recommend it to the student of construction or to any gentleman who is about to indulge in the luxury of a new house.

The only fault we have to find is that common to most books of the kind, viz. the occasional omission of a reference letter, or a small mistake in one of the figures; for example, in fig. 15, the fish-plates, evidently intended from the text to be inserted, are omitted, thus rendering the two outside bolts unnecessary.

The space given to Ironwork, sixteen pages, appears very small, but we presume this will be made up for in the "Advanced Course," to which the reader is frequently referred. EDITOR.

NOTES AND NEWS.

MESSRS. CASSELL, PETTER, AND GALPIN have in preparation, and will shortly publish in serial form, a comprehensive illustrated history of the United States.

MESSRS. CHATTO AND WINDUS announce the following amongst other forthcoming works: A new book by James Greenwood, entitled *The Wilds of London*, with twelve tinted illustrations by Alfred Concanen; Schopenhauer's principal work, *Die Welt als Wille und Vorstellung*, translated by Dr. Franz Hüffer, author of *Richard Wagner and the Music of the Future*; and a new volume of poems and sonnets by Philip Bourke Marston, entitled *All in All*.

IS respect to a paragraph in our last Notes and News, M. Paul Meyer writes to us: (1) that he is not going to print in the second part of his *Recueil d'anciens Textes* "all the versions of the Chanson de Roland," but only an extract of them; (2) that he has no work on the French *Chansons de Gestes* in the press, and does not even contemplate writing any on this subject; (3) that he is perfectly incompetent in the mediæval German poetry, and consequently would not venture on any account to give an opinion on so intricate a matter as the editing of *Nibelungenlied*.

We have referred M. Meyer's letter to the sender of the note in question, an exceedingly well-informed and valued correspondent, and we have received from him an expression of extreme

regret that he should have been induced to report, and report incorrectly, a conversation never intended for publicity. Our correspondent hopes that "the evidently humorous exaggeration of the note has misled nobody," and begs "to withdraw the note and to apologise to M. Meyer and the German scholars mentioned in it, for its appearance."

THE library of the Academy of Sciences at Lisbon, which formerly belonged to a Jesuit convent, now suppressed, possesses what is stated to be the finest illustrated missal in the world. It is the work of the Abbé Estevan Gonzalvo Neto, chaplain of Dom Juan Manuel, Bishop of Vizen, to whom he presented it out of gratitude, having been occupied in its execution from 1610 to 1622. The Bishop of Vizen, founder of the Jesuit convent, had placed the MS. in its library. It is a pontifical missal, such as is used at episcopal masses, and has always been held to equal in value the celebrated missal of Juvénal des Ursins, preserved in the National Library of Paris. When Thomas Boone was at Lisbon he offered 1,000*l.* for it, and later, a Paris house offered 65,000 fr. (2,620*l.*), but the Portuguese authorities opposed its sale. This beautiful folio volume is ornamented with twelve drawings with the pen, magnificently coloured, and models of composition and perspective, the subjects from the New Testament, and is also enriched with capital letters and numerous vignettes.

THE Rev. Canon Simmons will add to his parallel-text edition of four MSS. of the Early English *Lay Folk's Mass-book*, for the Early English Text Society, the following Bidding Prayers according to the Use of York:—1. From the tenth century Gospels in York Minster. 2. From a MS. Manual of 1405 belonging to Sir John Lawson, Bart. 3. From a MS. Manual of about 1440–50 A.D., in the York Minster Library, MS. xvi. M. 4. 4. A shorter form of about 1490–1500 A.D., written at the end of the last-named manuscript. 5. From a Manual of 1509 in the York Minster Library, printed by Wynkyn de Worde.

COUNT RIAN'S Latin-East Text Society (Société pour la Publication des Textes relatifs à l'Histoire et à la Géographie de l'Orient Latin) intends to appoint four honorary members from among the most distinguished Englishmen interested in the Palestine Explorations. The Society will then be put formally before the general English public. Mr. Richard Sims, of the Manuscript Department of the British Museum, has been appointed the Society's agent for England.

THE fourth volume of the great new *History of North American Birds*, by Professor Spencer F. Baird, Dr. Thomas M. Brewer, and Mr. Robert Ridgway, is expected to be ready early in 1875. It will contain the Land Birds, and complete the work.

MISS BUNNETT's revised translation of Gervinus's *Commentaries on Shakspeare* will be published early in October, by Messrs. Smith, Elder & Co. Mr. Furnivall's Introduction to the book will consist of six sections:—1. An estimate of Gervinus's great work. 2. A short account of Metrical Tests. 3. What they have done for ascertaining the spuriousness of work supposed to be Shakspeare's. 4. Their use in finding genuine Shakspeare work in plays supposed to be spurious. 5. The succession of Shakspeare's works. 6. Helps to studying Shakspeare-books; and a visit to Stratford.

THE Shakspeare Sunday Society, formed in connexion with the Sunday League, will hold its first meeting at the League Rooms in High Holborn, on Sunday, October 18, and will read *Love's Labour's Lost*.

THE Archives of Bologna have been recently investigated by the Professor Luciano Scarabelli, who has published his report upon them, under the title of *Relazione dell' Importanza e dello Stato degli Archivi Bolognesi*. Many of the facts re-

corded in these archives have reference to art and artists.

FROM *Triibner's Monthly Record* we learn that "Mr. Charles Rudy has published an English and Chinese grammar (Mandarin language), on the Ollendorffian method, in three volumes. This grammar is so arranged that it corresponds page by page with the Ollendorff grammars of other languages. . . . This plan will be of immense use to Chinese who wish to study European languages," but we fear that, at present, they are not likely to be very numerous.

FROM the same source we find that "the Khedive of Egypt is searching the mosques and monasteries of his dominions for MSS., to form a library at Cairo; he is said to have obtained thirty different MSS. of the Koran, and among them one computed to be 1,150 years old.

Nagavarma's Prosody "is ready for the press at Mangalore, and will be published in the course of this year."

GARIBALDI's new work, *I Mille*, has appeared at Turin in the form of a handsome volume, consisting of 450 pages, and having a title-page inscribed with Petrarch's lines:—

"Virtu contra furore
Prenderà l'armi e fia il combatter coto,
Chè l'antico valore
Negl' Italico cor non è ancor morto."

It has a long preface, addressed to the youth of Italy, who are reminded that politics are every man's concern, since each one has an interest in knowing whether his bark will be steered against rocks, or turned straight to port. Appealing to the Roman youth specially, he begs that such an example of quiet dignified energy may be set by them that their city shall be as a pole-star to every other Italian community, until Italy shall have secured her place as a flourishing and honoured land. The main part of the work, comprising sixty-three chapters, is occupied with the narrative of the exploits of the thousand volunteers, from which it takes its name. It concludes with an address to the 4,322 subscribers for the volume, who are assured that the author feels that his active share in political events is over, and that in giving them this work as a memento of his past exertions for his fatherland, he is conscious of the faults which it exhibits, regrets he was unable to produce anything more worthy of their acceptance, and assures them of his sympathy. It appears that only 1,942 persons have paid in their subscription of five francs, but the money thus obtained has already been disposed of, and after paying for the printing and publishing of the work, the managing committee have invested the surplus in Italian stocks for the benefit of the author.

JULIUS RODENBERG, the well-known Berlin *feuilletoniste* and novelist, is about to issue a new periodical, the *Deutsche Rundschau*, to be published by Gebrüder Paetel in Berlin. The first number will contain a novel by Berthold Auerbach, "Auf Wache;" a poem, "Zum Concil," by Anastasius Grün (Anton Graf von Auersperg); contributions by Theodor Storm, Eduard Hanslick (of the *Neue Freie Presse*), Emanuel Geibel, and Paul Heyse. Amongst the contributors to the second number, Gustav zu Putlitz, Eduard Lasker, Max Maria von Weber (the great composer's son) are named; and papers and literary articles for the third are promised by Rudolph von Virchow, Karl Hillebrandt, Friedrich Spielhagen, Adolph Wilbrandt, and others. There can be little doubt that a journal which counts such famous authors amongst its contributors, and with a man like Herr Rodenberg at the head, ought to be a success.

DR. WENDELIN FOERSTER has just completed his edition of *Richars li baus*, which now appears in print for the first time, and is to form the first of a series of Old Frankish poems to be brought out for the Imperial Academy of Sciences at Vienna. Hitherto this old epic has been known only

through the references made to it by Scheler and Casati, and although there is little in the poem itself to interest the reader, a work consisting of more than 5,000 hitherto unprinted lines, written in Old French of the close of the thirteenth, or beginning of the fourteenth century, can scarcely fail to bring many useful additions to our knowledge of the vocabulary and grammatical construction of this language, and if on no other account Dr. Foerster has done an acceptable service to philologists by bringing *Richars li biaus* more easily within their reach.

At the annual public sitting of the Academy Della Crusca at Florence on September 7, Professor Dazzi, in the absence of the author, read an eulogium on John, King of Saxony, by M. Alfred de Reumont. After describing somewhat in detail the general claims to distinction and respect presented by the late royal scholar, the writer paid a special tribute of admiration and gratitude to his memory for "the care with which he had endeavoured to interpret to his countrymen the *Divina Comedia*, and the influence which his example and literary labours had exercised in diffusing a better knowledge of Italian literature in Germany." King John was chosen corresponding member of La Crusca in 1838, but did not take his place as a member of the Society till 1854.

In the *Revue des Deux Mondes* (September 15), M. Louis Reybaud reviews the volume, published last year by M. Clément and M. A. Lemoine in conjunction, on *Les Derniers Fermiers-généralux*. The critic takes the most indulgent view of the system they represented, as a fiscal experiment, serving to introduce the machinery for more equitable and scientific methods of taxation; but, in spite of his apologies, it may be doubted whether any class that suffered in the Revolution would inspire less pity than the thirty-four farmers-general guillotined in '93, if Lavoisier had not been one of them.

M. J. E. PLANCHON, in the same number, gives an account of some of M. Jordan's experiments in support of the thesis that botanical species are fixed or, what comes to the same thing, that all variations are hereditary; but, while speaking respectfully of what he calls "Jordanism," he does not give the impression that the school will prove a dangerous rival to the evolutionists. His history of the attempt to identify the common wheat with a variety of *Aegilops*, discovered by Esprit Fabre, a gardener of Agde, is extremely interesting, and will be new to unbotanical readers, though it is some years since M. Godron's experiments have shown the *Aegilops* in question to be a hybrid only found on the borders of corn-fields.

A BI-CENTENARY edition of Bunyan's *Pilgrim's Progress* is in the press. It will be a reproduction in fac-simile of the first edition, with emendations borrowed from the second.

WE are sorry to record the death of M^{me}. Veuve Coppée, mother of the French poet. She died a few days ago, at an advanced age, at her house in the Rue Oudinot. She had long been stricken with paralysis, but was not wholly laid aside until the last. No work was ever finished by her son—no work was ever begun by him—in the success of which she did not take a vivid interest; and several of his poems attest his sense of that sympathetic influence on his career.

THE Rev. W. Scarborough, of Hankow, is said to be engaged on a work on Chinese proverbs, which will comprise some 3,000 examples. It will be published at Shanghai at the close of the year.

READERS fresh from Mr. Carlyle's vivid picture of the taking of the Bastille would experience a rude shock to their feelings did they know the cool manner in which the caterers for John Bull's amusement at that time served up the event. The

World newspaper for August 31, 1789, announces that at Sadler's Wells

"Will be presented an entire New, Grand, and Interesting Spectacle, taken from the circumstance of the Revolution in France, called

GALLIC FREEDOM

Or, Vive la liberté.

Comprising the most striking occurrences which happened during the late Commotions in

THE CITY OF PARIS,

And particularly of that ever memorable event, the ATTACK, STORMING, and DEMOLITION of the BASTILLE.

In the above piece will be correctly portrayed the Manners of the Assembled Parisians at the Gate of St. Martin previous to their assault of the Bastille—The Massacre of those that first passed the Draw-bridge—&c the Sacrifice of the Governor and his officers; with an authentic, minute, and affecting Representation of the

SUBTERRANEAN DUNGEONS

of that once terrific prison—the situation of the prisoners in their state of confinement, and the Actual Descent of the Citizens and Soldiers to their release.

With entire New Music, Scenery, Dresses and Decorations.

The Drawings for the different Scenes of the above interesting performance taken on the spot, and the Paintings executed by Mr. Greenwood."

The criticisms of the same newspaper on the performance were in equally good taste. We read:—

"Finer scenes of greater effect have not been produced at any Theatre for many years, particularly the dungeons, where the horror created by the cell, the mode of bringing out the different objects, particularly the figure of a supposed starved one, is greater than anything we ever remember—the comic humour as here and there interspersed, is very judiciously considered and the whole was highly finished by the different performers—our tribute of praise and thanks is due to the painter, the actor, and poet, for the whimsical lines of

The grand monarch's a noodle

To fight for Yankee Doodle

Et contre les Anglois—

which is a neat and excellent hit at this moment."

THE difficulties which beset the conscientious historian in the collection of original materials are amusingly exemplified by some correspondence addressed to Thomas Carte, the biographer of James, Duke of Ormonde, and now preserved with his other voluminous collections in the Bodleian Library. Carte's most diligent friend in collecting such like materials in Ireland was the Reverend Thomas Sheridan, friend and correspondent of Dean Swift. There was one person possessed of papers that Carte was most anxious to see, namely, Mr. Jeffrey Browne, of Castle McGarrett, grandson of Jeffrey Browne, a leading member of the Catholic Confederacy, who had been employed by the Supreme Council on an embassy to the Pope and the Court of France. Lord Athenry applied to him on Carte's behalf. He answered that he had too much business upon his hands of his own, his children's, and his grand-children's, to lay out his time in rummaging old papers. Sheridan writes concerning Lord Athenry's ill success, "that Mr. Browne confesses he has letters and memoirs for Carte's purpose, but he is such a lazy Irish brute, that he refuses to give himself the trouble of a search. They had cost him a whole winter to look them over, and although he was at that pains he was not ashamed to own that he never put them in order." In a subsequent letter Sheridan says he had not known what "Browne" was meant, or he could have got his memoirs long since for Carte, but he little imagined it was a gentleman called "Ha'penny Browne," one of their musical society, who had made many advances to him, but he would not be acquainted with him because of an unlucky character given of him by the Drapier. Lord Mountjoy, representative of Sir William Stewart, of the

county of Londonderry, a distinguished leader of the king's forces in 1641, had promised Dr. Sheridan between 300 and 400 letters (some of them original) of King Charles I. He had made several appointments with Carte to meet him at his lodgings, but "he was as hard to catch as a wagtail." Lord Massareen, representative of Sir John Clotworthy, had no papers of moment but his rent-roll, and the late Earl of Antrim was a man so insignificant and so very illiterate that Carte might be assured all such materials as were left by his ancestors underwent the fate of waste-paper. Thus from the time Carte was engaged with the Earl of Arran he was collecting all original materials for his work, but even before this engagement he seems never to have omitted any opportunity of obtaining information concerning original letters and memoirs that might throw light on Charles I.'s conduct in the affairs of Ireland. He has also left in his collection a very curious and interesting memorandum book, fair copied in his own handwriting, of notes made by him during his exile in France of conversations with his Jacobite friends, such as George Granville, Lord Lansdowne, Dr. Robert Lesley, Lady Sandwich, Mr. Dillon, and others, principally touching the secret history of the Restoration, and the designs of the Jacobites at the close of Queen Anne's reign, and their various plots afterwards to restore the Pretender; but it contains also such accounts as he got of historical collections.

THE following is the text of Chaucer's tattered receipt for his tun of wine in 1390 A.D., found, and completed as far as possible, by Mr. Walford D. Selby, of the Public Record Office.

"Sachent toutes gens moy Geoffrey Chaucer Esq^{ier} anoir ressu le iour del festuene dyestes de Johan Payn, Chief Butiller nostre seigneur le Roy un tonel de vyn] pur lan present, le quel tonel de vyn ie cognoise [estre paie, et le dit Johan acquite par yestes, enseales de mon seal. Donec la . . . iour de . . .] lan du regne du Roy Henri le quart apres la conqueste primer."

The writing seems that of a clerk, and not an old man. It is possible that it is Chaucer's, if his counter-roll keeping made him write like a clerk; but the probability is that this receipt was not written by the poet.

MR. WALFORD D. SELBY, of the Public Record Office, has found the following fresh document relating to Chaucer, which shows that when he was about to leave England on his mission to Lombardy in May, 1378, he appointed one Richard Baret as his substitute in his Controllership of Customs. The writ appears on the Memoranda Rolls of the Exchequer, Queen's Remembrancer [1 Ric. II., Easter. ro. 3 d.] :—

"London. Memorandum quod venerabilis pater T. Exonensis Episcopus Thesaurarius Anglie presens in Curia. xiiij. die Maii hoc termino [1378], testificatus est coram Baronibus, quod Galfridus Chaucer Contratoratorum custumarum et subsidii Regis in portu Londonie, qui ad partes externas in negociis Regis profecturus est, substituit loco suo Ricardum Baret, ad dictum officium exercendum in absentia sua a sexto decimo die Maii proximo futuro usque ad redditum ipsius Galfridi Londoni. Et super hoc, predictus Ricardus presens in Curia coram Baronibus dicto xiiij. die Maii, prestitit sacramentum de bene et fideliter se habendo in officio illo in absentia predicti Galfridi."

From the date given in this writ it would appear that Chaucer started on May 16, 1378; but this is not the case, as in his account of the expenses of this journey it is stated that the date of his departure was on the 28th of that month, on which day he received 66*l*. 13*s*. 4*d*. for his journey abroad. The "venerabilis pater" mentioned above was Thomas Brantingham, Bishop of Exeter.

A WRITER in the last number of *In Neuen Reich* describes at length an interesting festival

celebrated with horse-racing at Siena each year, on July 2 and August 15, or on the next Sunday following each of those days. The Sienese "Festa del Palio" takes its name from the "Palio," or embroidered banner which constitutes the prize of the victor in the race, and is held by the "contrada," or district of the city to which he belongs, and on whose behalf he competes. This division into "contrade" is contemporaneous with the earliest dawn of the history of the republic, while their number has varied with the varying fortunes and numbers of its population. Until the fatal plague of 1351 the city was divided into fifty-nine contrade; since 1675 it has kept unchanged its present number of seventeen, and these are known by names taken for the most part from animals, real or mythical, and have banners, arms and cognizances corresponding with these appellations. Thus, in the present day there are the "Contrada della pantera," "C. della giraffa," "C. dell'oca" (goose), "C. del drago" (dragon), etc. The games of the Palio have been celebrated since the end of the fifteenth century on the Piazza del Campo, commemorated by Dante, but until the year 1599 the festival was commemorated by bull-fights, for which each contrada supplied a bull and the required number of bull-fighters. In that year, however, in consequence perhaps of the prevalence of more humane views, these perilous sports were interdicted, and buffalo racing instituted in their place. The latter form of amusement was, however, condemned on similar grounds half a century later, and in 1650 the peculiar form of horse-racing now indulged in was inaugurated. The course, which is bounded by posts, and marked out by sand, is at some points not more than eight feet across, and by its sharp turn on the edge of a steep descent at the south-east corner of the Piazza, the race is not unattended with danger to the unsaddled native ponies, or to their helmeted, cuirassed, and hauberked riders, who, in their picturesque but cumbrous seventeenth century attire, are not unfrequently thrown at this point, and dragged under the horses' hoofs. More serious consequences are, however, generally avoided by the assuring, but not specially dignified, precaution of inserting mattresses between the posts at the ominous turns of the course. The writer, who witnessed the Palio races, which are not generally known to foreigners owing to the season of the year when they are held, describes in glowing terms the strangely picturesque charm of the whole scene, which, in its intensely national character, seems to belong more to mediæval times than our own prosaic age.

For the moment Siena appears robed in more than Oriental splendour. Every house flashes with brightly coloured hangings, every tower, roof and pillar hangs out gaudy flags and streamers, church bells peal forth, bands play, cannons resound, and in the midst of an excitement such as we may suppose the Roman games to have called forth, the gaily dressed population watch the proceedings of the day, which begin with the procession of the "Carroccio," drawn by four horses, and carrying the banners of all the contrade grouped round the lofty black and white standard of Siena. This "Carroccio" is, by the way, according to general belief, an exact copy on a small scale of the famed standard-chariot which the Sienese carried with them when they won their dearly-bought victory over the Florentines on the field of Monte-Aperto. The excitement with which every inhabitant of a contrada follows the fortunes of his champion and horse transcends the imagination of the most impressible cis-Alpine spectator. Young children are deprived of appetite, and sleep in feverish expectation of the event; little girls put up prayers to the Madonna for victory to their own contrade; boys discuss with passionate vehemence the merits of the horses and men that chance has given in the drawing of lots to their special district; while husbands and wives belonging to different con-

trade have been known to agree to separate till the eventful day had passed, lest their party feelings should prove too strong for their conjugal affections. Thus twice a year the entire mass of the people of Siena resigns itself to an impetuous excitement, to which modern times present scarcely a parallel, and which by its sudden and periodic recurrence would seem to afford evidence of the truth of the belief in the existence of an atavism, which reproduces at intervals the salient characteristics of a race.

THE press of Trieste has contributed its share of tributary respect to the memory of Petrarch by dedicating to the promoters of the July Festival two splendidly printed works. One of these consists of "*Scritti inediti di Francesco Petrarca*," (*pubblicati ed illustrati da Attilio Hortis*), including his speech before the Venetian Senate in 1353, and his address to the people of Novara after the taking of the city by Galeazzo Visconti in 1356. The other work, which is published at the cost of the Municipality of Trieste, is entitled "*Catalogo delle opere di Francesco Petrarca esistenti nella Petrarcesca Rosselliana di Trieste, per opera di Attilio Hortis* (Trieste, 1874). To students of Petrarchian literature this *résumé* of all that has been printed in regard to the poet's life and writings, with its careful enunciation of the different editions of his work, will undoubtedly prove alike valuable and interesting.

THE *Revue des Deux Mondes* contains some articles which deserve notice in this section of the ACADEMY. Foremost is an article which treats of the various improvements effected in the art of navigation from the time of the Phœnicians until now. Though necessarily technical at times such as when the writer explains the theory of projections, the successive improved methods of observing the sun's declination, and of taking observations for latitude and longitude, he is so thoroughly master of the subject that, by adopting a popular and lively style, he makes the article interesting to the general reader. He gives full credit to our merry monarch for the signal service rendered by him to navigation in founding Greenwich Observatory, with the object of ascertaining more accurately the movements of the heavenly bodies; and to our good Queen Anne for the princely reward (20,000*l.*) offered by her Parliament in 1714 to anyone who should discover how to arrive within half a degree of the true longitude. Harrison, in 1765, claimed the reward for a chronometer which enabled one to fix the longitude within the prescribed limit, but it was not till he had demonstrated the permanent value of the discovery by teaching other mechanicians his secret that he was adjudged the prize. At the present day the chronometers in the French navy number about 400, and are worth close upon 40,000*l.* The plucky voyages of Prince Henry and of the Portuguese along the African coast, their discoveries of Madeira, the Azores, and their subsequent progress along the west coast up to the time when Barthelmy Diaz doubled the Cape of Good Hope—all this is happily described. M. de la Gravière, the author, is evidently no friend to modern improvements and appliances in seamanship. With a conservatism that reminds us of Admiral Rous's spirited letters in the *Times*, he inveighs against ironclads, and though he cannot, we suppose, mean to deprecate the use of modern charts, nautical almanacs, chronometers and lighthouses, he is emphatically of opinion that these have shorn a sailor's life of its former grandeur and excitement, and made him the *enfant gâté* of the present age.

FROM the note-book of a deceased journalist we have been allowed to make the following extract:—

January 15, 1834.—This was the fiftieth night of the performance of the opera of *Gustavus III.*, or the *Masqued Ball* at Covent Garden Theatre; and the management of the doubled theatres—under Mr. Bunn, a gentleman of whom nobody, by the

bye, but myself who talk of him as I have found him, ever says a good word—determined after the good old English fashion to celebrate the somewhat unusual event by a grand supper, &c., on the stage of the theatre after the close of the performance, in the splendid scene of the Masqued Ball itself. I was one of the invited, and was, nothing loath to attend, being desirous of seeing those "diverting vagabonds" of actors and actresses for once in a way out of their assumed characters. Dinner-party-fashion-dressed I went to the theatre, and at the close of the performances presented myself at the stage entrance of the House somewhat too early, fancying that in this as in most cases that a man could not be too soon on the ground. But was somewhat too soon—a predicament in which, however, I was not alone, for I found that "absolute John" (Murray), the bookseller of Byron and the printer of the "Navy List" was my companion, with a third to me unknown, in a sort of ante-chamber about six feet square, where we stood cooling our heels by the light of a penny dip, dimly religious, for the matter of half an hour. I did not then know the great bibliopole, or I should have addressed him. He seemed to me a somewhat staid elderly gentleman in black, and white hair, with a slight bend of the sort a few years since, when it was fashionable to stoop a little forward, called "the Grecian." At length we three were ushered with all due "pomp and circumstance" through a variety of winding passages to the stage of the theatre, then in course of preparation for our supper. After wandering about the passages for some time and groping my way into the green-room, I found my host, who informed me that it would be some time, say an hour at least, before supper could be ready for us. I meandered among the coulisses, under the stage among broken bowls and daggers, &c., &c., into the private boxes, the gallery, and in short into every practicable nook and cranny with the most laudable intention of killing time before supper, and with great difficulty could barely accomplish it.

Bunn sat in the centre of the oval table, having on his right Lord Adolphus Fitzclarence, whose mother, Mr. Jordan, had so often delighted thousands from the same place, and on his right, Captain Polhill, formerly lessee of Drury Lane, and Bunn's best friend, if report speak truly. Amongst the rest of the company were Count D'Orsay, Lord William Lennox, Lord Glengall, and a host of other patrons of the theatres. At this upper table also was seated Mr. H., the female who nightly strutted with Bunn, *en Napoleon*, in the masquerade scene of the opera, holding a child by the arm. Near Captain Polhill was seated Ducrow in his dress as St. George, the only performer at Drury Lane who appeared in costume; behind him with as much splendour of dress, &c., stood his trumpeter, habited like one of those of the king's body guards. I was seated about the middle of one of the central tables, that on the chairman's left, and had on my left hand Miss Kenneth, on my right Mr. Young. At this table were seated at its head Mr. Furley; at its foot, Tom Cooke the facetious; among others at that table were Madame Celeste (whose real name was Mr. Elliott, she having married an American "of that ilk"), Mrs. Vining, Miss Inverarity, Miss Shirreff, "little Miss Poole" and her music master Templeton, Planché, a most supreme dapper little chap, Paul Bedford, and sundry others. At the table corresponding with mine, sat at the head Mr. Bartley, the foot Cooper, and about it Miss Phillips, Mr. Hanby, Blanchard, &c. At the outside tables were placed the chorus singers, and the second and third raters of all sorts and conditions. . . . The supper was a very excellent and abundant cold one; there was plenty of sherry and Madeira, some champagne and lots of claret, &c. At dinner I drank with all the female performers and some few of the males whom I slightly knew, &c.

THE papers publish a translation of the text of the will of Signor Girolamo Ponti, of Milan, who bequeaths nearly the whole of his fortune, amounting to about three-quarters of a million Austrian lire, to the three Academies of Science at London, at Paris, and at Vienna. The Academies in question (the first of which, unhappily, does not exist, unless the Royal Society can establish its claim to be considered such) are required to invest in safe securities, and to institute two annual competitions embracing the following subjects:—Mechanics, Agriculture, Physics and Chemistry, Travels by sea or land, and Lite-

ature. The Vienna Academy is only to admit Austrian Germans to the competition—a curious limitation, if taken in connexion with the testator's declared inability to master the German language. His own country, Italy, is to have nothing, it appears.

NOTES OF TRAVEL.

THE news of the safety of the Austrian Arctic Exploring Expedition was extremely welcome, as the gloomiest forebodings as to its fate were beginning to be entertained. A part of the following summary of the history of the Expedition appeared in the *Times* of Tuesday last:—

"The Austrian Payer-Weyprecht Expedition left Tromsø in the *Admiral Tgethoff* on July 14, 1872. They encountered compact drift ice in 48 deg. longitude, and worked themselves through until, in 58 deg. east longitude, they reached the coast of Nova Zembla, under the Admiralty Peninsula. They sailed along the coast to Berch Islands, where they met Count Witczek's sloop *Ishjörnen*. They sailed together with him to Baerent's Islands, near the promontory of Cape Nassau, where they remained at anchor till August 21, 1872, on account of south-westerly storms. There a depot of provisions was established. They parted from Count Witczek and steered north-east the same day, and were completely frozen in.

A more recent telegram from Lieutenant-Colonel Payer himself, completing the preceding, has been communicated to the *Neue Freie Presse* of Vienna, dated Hammerfest, September 7, 2 P.M. (arrived in Vienna the following day, at 11.10 A.M.):—

In 76½° North, in sight of Novaja Semlja, immediately after the separation from Count Witczek, we were enclosed with ice, and for two years it was impossible to free ourselves, whilst, sticking fast in an ice-pack, we were irresistibly driven northwards. From October 13 we were in great danger, being almost daily pressed between solid packs. During the whole winter we were always in readiness to leave the ship. In the summer 1873 we repeatedly tried to destroy the pack by sawing it and blowing it up with gunpowder, but without the least success. In the autumn we unexpectedly approached an unknown land, 200 knots northward from Novaja Semlja. We passed the second winter harbourless, three knots from land, under 79° 51' latitude, and 59° longitude. Between March 9 and May 4, 1874, we undertook excursions in sledges, for the exploration and mapping of the country, from 79° 54' to 83° latitude, and still further. There we christened the most northern place in the world by the name of "Cap Wien" (Cape Vienna). The most northern spot on which we trod was 82° 5'. Here we found no more land-ice, only coast-water and floating-ice; so we were only able to proceed with dogsledges across the great glaciers until we found it impossible to go any further, and were obliged to return. The land-water is about as extensive as at Spitzbergen, and covered with a bridge of one year's pack-ice. Both fauna and flora are very scarce in the south; the glaciers are of colossal dimensions; the sounds are full of icebergs. The principal stone is dolomite. The mountains consist of plateaux and precipitous peaks; some of them are 5,000 feet high. Very little drift wood is visible.

The longitude of the land comprises at least fifteen degrees, but we could not see the limits even from the mountains. During two winters we lived for seven months in one continuous night. The minimum temperature during our sledge excursions was 40° Reaumur on land, and 37° on shipboard. In May pressing circumstances induced us to quit the ship—the engineer, Krusch, had died of consumption and scurvy. The vessel was raised by the pressure of ice, and heeled over to such an extent that we were unable to remain in her. In accordance therefore with the opinion of our regimental physician, Dr. Kopes, we were obliged to quit the *Tgethoff* on May 20. The retreat in boats and sledges lasted ninety-six days. Seventy miles from the North Cape Nassau, under 77° 40' North, we left the pack-ice. On August 15 we sailed down on the open sea to the coast of Novaja-Semlja. On August 24 we were taken up and most cordially received by the Russian mariner Feodor Voronin, on the schooner *Nikolaj*. After a passage of nine days we arrived in Vardoe. In Norway we met everywhere with a most hearty reception.

In all the places through which we have hitherto passed flags were flying. After our return to Hammerfest we met the English Expedition on the steamer *Diana*, which had gone to the Karic Sea in search for us.

In Vienna the most enthusiastic reception awaited the returning explorers, who should have reached this city yesterday, the 25th of this month. The Imperial Academy of Sciences, the Hungarian Academy, and several other scientific associations were to congratulate them at the station. A great banquet will be given in honour of the members of the expedition in the Cur-Salon, in the Stadtpark, etc. The results of the Austrian expedition at the North Pole, as far as they are known until now, must be pronounced to be highly gratifying.

WITH reference to an account of the Moscow archives given by a correspondent of the *Athenæum* last week, we may notice that Archdeacon Coxé paid a visit to them about a century ago, and published in his *Travels into Poland, Russia, Sweden and Denmark*, some interesting details gathered from the documents preserved there of the early relations between our court and that of Russia. The earliest correspondence between the sovereigns of England and Russia begins about the middle of the sixteenth century, soon after the discovery of Archangel, and chiefly relates to the permission of trade granted exclusively to the English company of merchants settled in that country. There are numerous letters from Elizabeth to Ivan Vassilievitch II., some of which are printed in Hackluyt's *Voyages*. One of them, not in that work, contains an offer of an asylum in England to Ivan and his family, in case he should be compelled by an insurrection to quit his own country. Some historians have asserted that this Czar carried his personal regard for our Queen so far as to become one of her suitors, but Coxé found nothing in these archives confirmatory of such intentions. In the reign of Charles I. the amity between the two courts was so well established that we sent some troops, under Colonel Sanderson, to the assistance of Michael Feodorovitch, against Ladislans, King of Poland; and Alexis Michaelovitch occasionally furnished Charles, when most distressed, with money and corn. The last letter from this unfortunate king to Alexis is dated Isle of Wight, June 1, 1648. A letter has also been preserved from Charles II. to the same Czar, announcing the execution of his father. It is dated September 16, 1649, and was brought to Moscow by Lord Culpepper. During the Commonwealth Alexis maintained a constant correspondence with the exiled Charles. He declared that all monarchs should esteem the cause of Charles I. as their own, and refused for a time to hold any intercourse with the Protector. It seems certain, however, that some correspondence afterwards passed between them, as he consented to receive ambassadors from England; but no traces appear of it at Moscow. The Restoration of Charles II. renewed the friendly relations between the two countries, and after that date the despatches received from England become so numerous that (writes the Archdeacon) it would have required several days to have examined them with any degree of attention.

PETERMANN'S *Mittheilungen* for October opens with a memorandum explanatory of a map of the island of Haiti, which has been compiled chiefly from a geological map of the Republic of St. Domingo, by W. Gabb, from a special map of the island by Schomburgk, and from some English Admiralty charts. Dr. Nachtigall contributes a letter containing some interesting remarks on the Baghirmi country, a region to the south of Lake Chad in Central Africa. Elephants, he remarks, are common, and the ivory they yield is of excellent quality; the rhinoceros does not occur to the south, but in Baghirmi proper it is very common. Lions and leopards are met with not unfrequently, as well as other *felineæ*; hyenas and wild boars abound, as well as some species of

antelopes. In the river Shari and in some other streams are found the river-horse and crocodile, the flesh of the latter being highly prized (!), while the scaly hide is used by the natives for dagger sheaths. The horses peculiar to the country are small, fearless and sure-footed breed, capable of much fatigue. By the southern tribes these little horses are preferred to the larger breed from Bornu. The trees chiefly met with are the bombax or silk-cotton tree; the butter tree, from which a sort of vegetable butter is obtained; the deleb palm, the ashes of which yield a species of salt, tamarinds and date palms. The inhabitants are a uniform black in colour, though red skins are occasionally met with. They are all above medium height and strongly built. The women wear their hair cropped short; the men, on the contrary, wear it long, and fantastically adorned with feathers and pearls. The principal weapons are a sort of hatchet, which is often hurled at the enemy, lances, daggers, and shields of basket-work or buffalo hide, sometimes shaped like the Roman *scutum*, and at other times square and light for hand-to-hand encounters. Blow-pipes are also commonly used, the arrows being weighted with a lump of clay to make them fly straight. Agriculture is the main occupation of the people, and their only implement consists in a sort of clumsy heart-shaped spade. Drums are in great favour with them, as well as horns with holes bored in them like as in a flute. They believe in the existence of a superior deity, which they identify somehow with the thunder and the weather, and in evil spirits and witchcraft. Polygamy is a recognised institution, a wife having a regular market value. When murder, theft, adultery, or any similar act is committed, the injured party usually takes the law into his own hands instead of waiting for the decision of the judge. In conclusion, Dr. Nachtigall predicts that Baghirmi will, in all probability, become a province of Wadai, which seems destined to play a leading part among the Central African States. The next article consists of a short account by Captain Kostenko, of his return journey from Khiva down the Amu-daria, and across the Aral to Fort Kazalinsk. Then follows a short description of the St. Gothard tunnel, the particulars of which have already been made known to English readers through journals in this country, and a sketch of the naphtha springs of Irak Arabi in Mesopotamia. The concluding note is an attempt to identify the oasis of Charchedachel in the Libyan desert, lately explored by Rohlf's expedition, with the Oasis of Herodotus.

GENERAL CUSTER, at the head of a small expedition, has explored a mountainous tract of country called the Black Hills, situated in the south-west portion of Dakota territory and to the east of Wyoming, U.S. The hills form a complete circle about a hundred miles in diameter, and enclose a wonderfully productive valley, which, as well from its fertility as from never before having been visited by white men, is likely to attract the attention of the Government. The General, in one of his reports dated July last, represents the country as exceptionally well wooded and abounding in good pastures and water. The tracts of open and wooded country are so conveniently proportioned (ranging from about one acre upwards), that settlers would have no clearances to make, while the richness of the soil is admirably suited for the growth of the less hardy crops. Gold has been discovered, lead, and some indications of silver, but no opinion can as yet be hazarded on the quality of these metals. General Custer reports the health of his party as excellent, and hoped to return to Fort Lincoln by August 31 last.

PROFESSOR ZITTEL, of the Royal University at Munich, who, as is well known, took part in the Rohlf's expedition to the Libyan desert, read a paper before a recent meeting of the Bavarian Geogra-

phical Society on the results of the before-mentioned expedition, which was highly interesting both from a topographical and geological point of view. The expedition started on December 18, 1873, and set out on its return from the desert on March 31, 1874. For astronomical observations Dr. Jordan was attached to the party, and Dr. Aschersohn for botany. Only a few plants (about twenty different species) were found in the desert proper; but these few were highly important, both with regard to form and distribution. As was foreseen, however, the richest results fell to the part of the geological section, in relation, namely, to the period of formation (strata containing nummulitic stones were very abundant, as well as upheavals of a more modern date), and also in relation to the figuration of the soil. As regards the latter, there were first the desert plateaus, at present, (even in the caverns with stalactite formations), entirely devoid of water; secondly, undulating wastes covered for the most part with shifting sands; thirdly, desert valleys, containing salt lakes, lying partly much below the level of the sea; and, fourthly, oases with fresh-water springs, the water of which, however, is in some cases warm. On one of these oases is situated the ancient temple of Jupiter Ammon, and a population of about 8,000 Libyans, mostly nomads.

THE French Association for the Advancement of Science voted, at its last sitting, the sum of 1,300 francs towards defraying the expenses of sending a naturalist with the expedition for the observation of the transit of Venus. The ship, under the command of Captain Mouchez, will go to the island of St. Paul, and cruise in those shores for a considerable time, having on board M. Velain, who is charged with the deep-sea dredging and the survey of the islands of Amsterdam, St. Paul, and Bourbon, for which his explorations with M. Lacaze-Duthiers in the *Narwal* have well prepared him. The Minister of Public Instruction had only 2,000 francs at his disposal to carry out this expedition, which sum being inadequate, the French Association have gladly availed themselves of the opening to combine, in an efficacious manner, with the expedition of which the observation of the transit of Venus is the occasion.

BOSTON LETTER.

Boston: Sept. 9, 1874.

This week has appeared the *Life of Benjamin Franklin*, by the Hon. John Bigelow. It is a work in three volumes, crown octavo. What distinguishes this from the many other lives of Franklin, is not only that it contains the best edition of the admirable autobiography, but that at the point where that ceases, 1757, when Franklin was just beginning the most important part of his public life, the reader does not drop into the dull prose of the biographer, but goes on with Franklin's own narrative as taken from his letters. In Sparks's *Life of Franklin* this difference of style is most clearly noticeable, and while the edition is very valuable for its complete collection of his writings and correspondence, the author's continuation of the life is very dry reading. Mr. Bigelow says in his preface with great truth:—

"If I may judge by the unexampled popularity and influence of his memoirs of the early part of his life, am not mistaken in supposing that the world will be more interested in reading his own account of those more eventful years which followed, than in what any other person has said or can say about them. However we may prize the judgments of discriminating biographers of Franklin, their interest must always be subordinate to that which we feel in his own; and the pleasure, be it never so great, which we experience in reading other versions of the incidents of his varied and picturesque career only increases our curiosity to read the account which he gave of them at the time, to his government and friends, in his own pure, limpid, and sparkling English."

What this editor did was—

"to condense Franklin's own memorials of his

entire life, hitherto scattered through many bulky volumes, and yet more bulky manuscript collections, into a single compact work, and to give them the convenient order and attractiveness of a continuous narrative."

For this purpose he took "from his writings and correspondence whatever was autobiographical, and presented it in a strictly chronological order."

It so happens that Franklin's autobiography ended with his arrival in England in 1757, and until 1785, for twenty-eight years, he lived abroad, making but two short visits to this country. His correspondence during that time was remarkably copious, and for the five years between his return home and his death, there are his letters to his many friends in Europe. Of especial service to this conclusion of his work were the letters to M. Le Veillard, of which Mr. Bigelow was fortunately able to make use. From this rich amount of material the editor has made wise selection, and the result is by far the most valuable Life of Franklin that exists. It is much more entertaining than Mr. Sparks's, and far more dignified than that by Mr. James Parton. Franklin was certainly an admirable writer, and we have his life told by himself, who knew it best, and the charm of autobiography is not lost.

Mr. Bayard Taylor's drama, of which mention was made in my first letter, comes out this week. Its name is *The Prophet: a Tragedy*. The scene is laid in this country. Just now we find a great many novels written about different parts of the United States. While until very recently we were exceedingly diffident about our geography, the tide has turned, and we have novels of the Border States, of the South-West, &c., each one of which brings its new supply of local phrases and amusing Americanisms. In this tragedy the scene of the first act is laid in New England, of the four others in a Western State. The play takes its name from David Starr, a religious fanatic, who is born in New England, and who goes to the West to found a new religion. In that region he builds a temple, and collects his followers about him. Then, although a married man, he falls in love with Livia Romney, "a woman of the world," as she is called in the list of *dramatis personae*, and establishes polygamy—a point in the play which makes the resemblance of the new religion to Mormonism exceedingly close. The rest of the tragedy bears out this supposition. The authorities are stirred up about such tenets, and the Sheriff, Colonel Hyde, comes to the front of the temple to arrest David, speaking as follows:—

"You're he I seek. The law, that freedom gives
To manifold belief, now takes alarm
At vicious usages, by you proclaimed
As holy. You are called to meet the charge
Of wilful crime, with others, whom to this
You have persuaded."

DAVID.

And should I resist
Such intermeddling with permitted faith?

COLONEL HYDE.

Though loud report of your licentious lives
Commands my action, we are armed with proof,
And here resistance would be added crime."—&c.

Colonel Hyde withdraws, giving them one more day before serving his writ. When he does return, it is with a large force of armed men, who fall to fighting with the faithful. David is shot through the breast, but he makes his way to the altar of the temple, and there dies in the arms of Rhoda, his first wife, disowning his Livia. Nimrod Kraft, "High Priest," the Brigham Young of the tragedy, seizes the ark from the altar and escapes through the chancel-door, and with this the curtain falls. If this is a dramatic representation of Mormonism, a great deal of the exact truth of history is slurred over for theatrical effect. Elkanah and Hannah, the parents of David Starr, are singularly unlike the father and mother of Joseph Smith, junior, the founder of that religion.

Of them we read, in the *New American Cyclopaedia*, that "they avoided honest labour," that "they were intemperate and untruthful, and were commonly suspected of sheep-stealing and other offences." There is no mention of these things in the tragedy. The short specimen given above will show what is to be found in it, and that is, an exceedingly small amount of action, and a very vague representation of human characters, who speak blank verse with as close a resemblance to poetical truth as Colonel Hyde's remarks bear to legal formulas.

The scientific world has met with a severe loss in the death of Professor Jeffries Wyman, of Harvard College, which sad event took place on Friday last. He was born in this state, August 11, 1814, and had consequently just completed his sixtieth year. He graduated at Harvard College in the year 1833, he then studied medicine in the Harvard College Medical School, and in Paris, carrying on his work in natural history at the Jardin des Plantes in that city. After his return to this country he lived in Virginia, being Professor of Anatomy in the Hampton Sydney College of that state. In 1847 he accepted the post of Hersey Professor of Anatomy of Harvard College, and Professor of Comparative Anatomy in the Lawrence Scientific School, which positions he filled until his death, with great honour to the college and to himself. He was also a member of the faculty of the Museum of Comparative Zoology. When George Peabody made his generous gift to the college for the establishment of the Museum of Ethnology, Professor Wyman was appointed Curator, and he had already made considerable collections for that Museum. He was a great worker, in spite of delicate health; but his reputation, except among those who kept up with his frequent and valuable contributions to scientific journals, was far behind his deserts. His articles may be found in the *American Journal of Science*, the *Smithsonian Contributions to Knowledge*, the *Boston Journal of Natural History*, and the *Proceedings of the Boston Society of Natural History*, of which society he was for many years president. Within the science of Comparative Anatomy he gave his attention to various subjects. He was the first to describe and name the gorilla; he was the first to dissect the eyeless fish of the great cave in Kentucky; he discovered the parasite in the cerebellum of the snake-bird; he made several interesting discoveries about the aboriginal inhabitants of this country; in short, he was unceasingly devoted to his studies. In Cambridge he had a certain number of pupils, who became deeply attached to him, but he was of too shrinking a disposition to have the large following that Agassiz had. He was personally one of the most modest of men. His opinion on any scientific subject was of the utmost value, so careful was he not to make up his mind except after a thorough examination of every argument for and against. He has left behind him the deep impression of a man whose modesty and kindness were equal to his rare ability.

A few months ago the ACADEMY referred to an article in the *Nation* about the poems of a little girl, which had recently been privately printed. Since then the volume has come into my hands. Most of the pieces are merely conventional and incoherent, but the following lines are certainly devoid of any traces of morbidness:—

"I used to play 'neath the apple-tree,
And then with my dollies I'd take real tea;
Then I and my darling sister Bess,
We'd go to the pantry and make a mess."

The plays are delightfully free from conventionality. "Victor, the King of Fairyland," contains some touches that are really marvellous. Such, for instance, is the speech of the fairy when turning Eva, one of the heroines, into a river:—

"So I'll punish thee.
Thou'lt have no voice except the dashing sound
Of thy dark waves on the resounding shore."

Thy waves shalt dance, but never, never more
Thy fleet foot on the smooth-cut ring of green
Shall keep time to the nightingale's sweet voice!"

"Poetry Everywhere" concludes as follows:—

"Tis poetry, poetry everywhere—
It nestles in the violets fair,
It peeps out in the first spring grass—
Things without poetry are very scarce."

So much for the children: the literature of adults is just now in a very languishing state.

CORRESPONDENCE.

OLYMPIA.

Athens: Sept. 13, 1874.

Few works of public utility in Greece are so urgent as the construction of a thick wall in the bed of the Alpheios, for this river continually undermines and destroys its high northern bank. Thus Olympia is losing yearly 10 to 13 feet in breadth, and, if this state of things continues, in less than 100 years the whole plain of Olympia will have disappeared as far as Mount Kronion.

He who may doubt of this, let him measure the present bed of the Alpheios, and let him compare it with the bed of this river as represented on Tablet II. of Ernst Curtius' celebrated work, *Der Peloponnes*, published in 1852; let him notice the Roman building and the four Roman tombs, which are now visible in the high northern bank, and of which no trace will be left next spring; let him enquire of the old men of the neighbouring villages, who remember the bed of the Alpheios to have been 200 mètres, or 667 feet narrower than the present bed. The latter as well as the present bed of the Kladeos, which flows into it at a right angle, are considerably deeper than the ancient beds of these rivers, which are distinctly indicated, 20 feet below the surface, by a layer of round pebble-stones. The present much greater depth of the two river-beds is besides proved by the dikes, or piers of earth, which in ancient times the Elians were obliged to erect to prevent the inundation of Olympia; further, by the layer, 10 to 13 feet thick, of alluvial soil that covers the temple of the Olympian Jupiter, which has been partly excavated in 1829 by the French expedition; for even in the time of the heavy winter-rains the Kladeos does not rise now sufficiently to fill its bed to half the height of its banks, whilst owing to the present enormous bed of the Alpheios, the rise of this river in winter does not exceed 6 1/2 feet.

There can be no doubt that the said layer of pebble-stones, which once was the bed of both rivers, extends as far as Mount Kronion; and this proves that the Alpheios flowed in prehistoric times close to this hill, from which it gradually receded to the south, until it reached the foot of the high opposite mountains; and having excavated there its present bed, 33 feet deep, it returns by the same way, destroying its high northern bank. As soon, therefore, as the German government begins the excavations of Olympia, it is first of all necessary to erect in the bed of the Alpheios, close to its high and steep northern bank, a wall 8 feet high and 4,000 feet long, extending from the mouth of the Kladeos eastward, for in no other way can Olympia be saved from destruction.

I advise the German government very strongly to begin the excavations from the eastern bank of the Kladeos, at a depth of 20 feet, on the ancient river bed of round pebble stones; to proceed thence systematically eastward, and to throw all the rubbish into the Kladeos, whose current carries it off at once. In this manner will be discovered not only all the existing historical, but also all the prehistoric, antiquities, for it appears next to impossible that there should exist any of the latter below the very ancient river bed of round pebbles. Besides, this is by far the easiest way to excavate Olympia. In any other manner one would encounter enormous difficulties, and have at least twice as much work. But no mode of excavating is more difficult and more tiresome than that to cast the rubbish around the excavations. I cannot advise them on any account to begin the excavations from the north bank of the Alpheios, for it is 667 feet distant from the temple of the Olympian Jupiter; and for this reason it is not probable that monuments would soon be discovered, sufficiently important to encourage the German Government in its grand enterprise. Small but interesting objects exist, however, in the rubbish which the Alpheios breaks down from its northern bank, for such are frequently found by the peasants in the bed of the river. Only lately they picked up a statuette of silver 20 centimètres high, which they offered to me for 1,200 drachmas.

DR. HENRY SCHLIEMANN.

NEW SHAKSPEARE SOCIETY.

3, St. George's Square, N.W.: Sept. 21, 1874.

Mr. Fleay has possibly forgotten that when, on June 26, his resignation was handed to the Committee, and at once accepted, his letter stated

that his paper read that evening on *Macbeth* and *Julius Caesar*—which he had himself substituted for his long-announced paper on *Henry VI.*—would be "the last that he should contribute to the Society," and that he should not continue "the series as he had promised." The same letter also stated distinctly that he then ceased "to be a working member of the Society."

The Committee therefore, of course, concluded that all Mr. Fleay's promised work for the Society, except the papers then in the press, was abandoned; and instructions to that effect were given to the printers. But the Committee were afterwards much surprised to find that, on August 20, nearly two months after his declaration that he had ceased to be a working member of the Society, Mr. Fleay had sent to its printer, as copy for his (abandoned) edition of the first quarto of *Romeo and Juliet*, some revises of Mr. Daniel's reprint of this quarto, which had been sent to him (Mr. Fleay) on May 28, a month before his resignation. On September 1 the Committee were further surprised by receiving a note from Mr. Fleay, asking whether they intended to proceed with his editions of the *Romeo and Juliet* quarto and *Henry VI.* On September 11 the Committee, of course, informed Mr. Fleay that they did not intend to proceed with these editions. And it is for their adoption and confirmation of his own former express action that he now blames them!

Had Mr. Fleay given the date of my "very last communication" to him, saying that Messrs. Childs "were ready to go on printing *Henry VI.*," every one would have seen that it was long before his resignation, and his ceasing to be "a working member of the Society." But that would not have suited his case.

F. J. FURNIVALL,
Founder and Director of the New
Shakspeare Society.

"WHO WROTE OUR OLD PLAYS?"

Skipton: Sept. 19, 1874.

In your number of September 12 there is a letter from Professor Dowden respecting my date for *Cymbeline*. Mr. Dowden is not correct in saying that I was anticipated by Professor Hertzberg, as my investigations were made in 1868, though not printed till 1874. But this is a matter of no moment, as Mr. Hertzberg's investigations are confined to Shakspeare, and that is a very small part of my work. The real originator of verse-tests for Shakspeare was Malone, who not only saw the necessity of them, but rightly decided that the rhyme-test was the one to be relied on. Professor Hertzberg's notion that the feminine ending is to be trusted for his purpose is simply ludicrous, and the statement of percentages of the plays quoted is incorrect; the difference is 6 per cent instead of 1. It is sufficient refutation of the general principle that the Professor only applies it to nineteen plays: he well knew, if he applied it to all consistently, it would place *Richard III.* after *Othello*, a result that no critic, aesthetic or other, would allow. I regret that my proofs that neither this nor the weak-ending test can be admitted *per se* for determining the dates of Shakspeare's dramas are among the excursus for my edition of *Henry VI.* refused by the Shakspeare Society. I deferred answering Mr. Dowden's letter in order that he might, if he would, send me Professor Hertzberg's results, which I wrote to him for, as I cannot get at that gentleman's work here. In fact, I am ashamed to say that even his name is new to me. I have not yet received an answer to my letter. I demur, however, to Professor Dowden's dictum that aesthetic criticism gives a date of 1611 for *Cymbeline*. Aesthetic criticism imperatively demands its being anterior to *Philaster*, which cannot be placed so late. In conclusion, let me thank Mr. Dowden for writing in a courteous and gentlemanly spirit of my work. I would that all your correspondents would do so. F. G. FLEAY.

SCIENCE.

INTERNATIONAL CONGRESS OF ORIENTALISTS.

TURANIAN SECTION.

WE reported the proceedings of this Section in our last, but we think our readers will be glad to have the text of Sir Walter Elliot's address, which was not read, but which he has since sent to our Office. It is as follows:—

In opening the Turanian section, it may be well to define its limits. I have been asked again and again what is meant by the term Turanian. I may therefore say that Turán originally referred to the countries bordering on ancient Persia. To the Aryan dweller in Persia, whatever was not Irán, was Turán, and all foreigners were Turíyan or Turanees; but in early times of limited intercourse, these terms were virtually restricted to the neighbouring countries on the north and east of Persia—the Scythia of the Greeks. The Chevalier Bunsen, in a Report on the Results of Egyptian Researches in reference to Asiatic and African Ethnology, presented to the British Association at Oxford, in 1847, proposed to include under the term Turanian all languages of Europe and Asia which are neither Semitic nor Aryan. And in this sense it has been adopted by the organisers of the Congress.

Thus extended, the section has to deal with a great variety of tongues and dialects, forming several well-defined groups, connected by a principle of construction, common to them all, which philologists have called agglutination, in virtue of which the particles (that is, pronouns, prepositions) forming conjugations and declensions are not, as in other languages, absorbed and lost in the integrity of the word to which they are joined, but can be detached and distinguished from the root.

This peculiarity is supposed to be a condition incident to the circumstances of nomadic life, in which communities, loosely associated, have little intercommunication, and, I think, derives some explanation from a consideration of Professor Huxley's classification of the varieties of mankind, as applied to the habits of the Turanian family. Looking from the standpoint of a biologist, at physical characters alone, without reference to language or history, he finds the types of what (for want of a better name) he calls the Australoid race, in the inhabitants of Australia, the hill tribes of India, and the ancient Egyptians. We can trace its characteristics as defined by him from the Scythian birth-place of Tur, through the Himalayas, the Rajmahal Hills, the Goands and the aboriginal tribes of Central India, to the mountains of Ceylon, and they are distinctly stamped on the features of the Hindu population, modified, of course, in various degrees by subsequent immigrations. I think it probable that the Turanian occupation of Australia took place at a time when that great country still formed an integral part of Asia, and that, cut off by later geological changes, the inhabitants have thus not been subjected to foreign innovations. A critical examination of their numerous dialects, compared with those of the barbarous hill races of Asia, the Ainos of Japan, the Kols, the Mincopis, and the nomade tribes who still wander over India, may yield materials for tracing more completely the origin and ramifications of the Turanian race.

I have said that the Turanians form several well-marked groups. Of these I will first notice the Dravidian, with which I am the best acquainted. It is represented in its most perfect form by the Tamil spoken in the Carnatic, the Dravidésam of the natives, whence the generic name. The influence of Aryan supremacy has there been felt the least. The more northerly dialects of Telugu, Canarese, and Malayalam have all adopted the phonetic system of Sanskrit. Tamil alone retains its normal rugged character. It wants altogether the aspirated letters, and has some two or three sounds and characters peculiar to itself. It

has been cultivated and refined by native poets and grammarians, and under the princes of the Pandyan dynasty the College of Madura was celebrated for its learning and for the refinement and polish it imparted to Tamil literature. Not less important has been the influence of Western scholarship. The Jesuit missionaries, in particular, have left their impress on the language. Roberto de Nobili, an Italian Father, composed many works in the latter half of the seventeenth century; but Beschi, who arrived in 1700, has established the highest reputation. His grammars still form the best introduction to the language, and among his voluminous writings a metrical history of our Saviour—the *Tembávani*, composed about 1726—is considered one of the most elegant and classical works in the language. The original autograph MS. of the poem was purchased by the late F. A. Ellis from the son of Beschi's disciple in the beginning of the century for a large sum, but was lost for a time after that able student's premature and unexpected death in 1818. It was my good fortune to recover it, and it is now deposited in the library of the India Office, from whence it has been sent for exhibition to the section this evening.

The language continued to be cultivated by the missionaries of the Christian Knowledge Society, and in 1728 the Scriptures, translated by Ziegenbalg, were printed in Tamil type at Tranquebar. A copy of this edition, now of extreme rarity, is also before us. The names of Rottler, Rhenius, and other Danish scholars in the same mission, are conspicuous for useful works. Still later, Dr. Caldwell, by his *Comparative Grammar of Dravidian Languages*, of which a second and improved edition is about to appear, has thrown a flood of light on this class of tongues. Nor must I omit to mention the German scholars connected with the Basle mission. Dr. Moegling has edited lithographed editions of the most remarkable Canarese classics under the title of *Bibliotheca Carnatica* and his fellow labourer, Dr. Gundert, has produced a Malayalam Dictionary, published in 1872, admirable for its fullness and arrangement—a model of lexicography. Another zealous labourer in the Dravidian field is Dr. Brunell, who has examined and catalogued several native libraries, and collected vocabularies of vernacular dialects.

Beyond the limits of the Dravidian provinces the subject has received the greatest attention from Mr. Brian H. Hodgson, a new edition of whose essays on the religion and literature of the Himalayan tribes have been published by Trübner within the last few days.

I am less qualified to speak of the progress of the Trans-Himalayan languages, but the deficiency will be amply supplied by the distinguished philologists I see around me. Professor Hunfalvy will explain his view that the connexion between the Turanian tongues is more intimate than has hitherto been supposed. The section might have counted on an exposition of the affinities of the newly discovered Sumerian or Accad language, which have classed as Turanian, but the subject was discussed yesterday in the Semitic section by Professors Oppert and Schrader. There still remains, however, the enquiry into the origin of the ancient Etruscan, on which Mr. Isaac Taylor has offered a paper to the section, which will doubtless lead to profitable discussion, and may elicit some links connecting it, as has been surmised, with Accadian.

There remain to be noticed the monosyllabic languages of China and Japan, which were fully discussed in the first Congress. In this department the French Sinologues from the time of Abel Remusat and M. Julien have held the highest place. We are promised two interesting papers by the Rev. Messrs. Edkins and Beal, both profound Sinologists, after which M. de Rosny, the distinguished President of the first Congress, will make some observations, which, coming from such a source, will be received with the greatest interest; and lastly, Baron Textor de Ravisi will

call attention to the importance of a more scientific cultivation of Tamil in this country.

In connexion with this branch I may call attention to the dictionary of the Chinese dialect of Amoy, by the Rev. Carstairs Douglas, which possesses this remarkable quality, that the Chinese signs are represented by Roman characters, an ingenious experiment, carrying out in some degree the suggestions thrown out in the President's address for the adoption of an alphabet suited to all languages. I may also notice the Rev. Mr. Legge's translation of the Chinese classics, comprising seven works, and filling eight volumes, as of the greatest value to every one engaged with the literature of the Celestial Empire. Mr. Legge is still continuing his valuable labours.

We will now proceed to the business of the section, and I will ask Professor Hunfalvy to favour us with his paper.

ARYAN SECTION (September 17).

After the conclusion of Professor Max Müller's address, the text of which we gave in our last, the proceedings were conducted as follows:—

VEDIC GEOMETRY.

Dr. G. Thibaut (Professor at the University College of Wales) read a paper on Vedic Geometry, in which he tried to establish the close connexion of the first cultivation of geometrical operations with the sacrificial requirements of the ancient Hindus, and thereby the purely Indian origin of this science. His remarks were chiefly based on the *Sulva-sūtras* (or "rules of the cord") of Baudhāyana and Āpastamba, which teach the measurement of the ground for sacrificial purposes and the construction of the various altars, especially of the *agni*, the large altar built of bricks, which was required for the great Soma sacrifices. This altar could be built in a great variety of forms—imitating the shape of different birds, of a tortoise, a chariot-wheel, &c.—while its area had always to remain the same. This could not but lead the priests to investigate numerous geometrical problems. The results at which they arrived are embodied in a series of rules for geometrical constructions, which form the first chapters of the above-mentioned *Sūtras*. The Hindus were in those early times acquainted with the proposition, the discovery of which the Greeks ascribed to Pythagoras, although it is expressed by them in terms of a very primitive kind; and they even tried to establish a kind of proof by enumerating a number of cases in which the sides and the diagonal of an oblong can be expressed in integral numbers. They likewise tried to find a numerical expression of the relation between the diagonal and the side of a square, and by an ingenious method arrived at a very close approximation. By a skilful use of the Pythagorean proposition they were enabled to perform a great number of the required geometrical operations; to construct squares equal to any number of given squares, to find the difference of two given squares, to turn oblongs into squares, &c., &c. The last and most complicated task the priests proposed to themselves was that of finding a circle equalling as closely as possible a square. In this attempt also they were led by some sacrificial rules enjoining on certain occasions the substitution of a round altar for a square one. They were not indeed very successful in their attempt; their methods being much more imperfect even than the imperfect rules of later Indian mathematicians; but this fact tends at least to establish the chief point, viz., the comparative antiquity of the *Sulva-sūtras*.

Dr. Thibaut intends to publish in the next number of the *Journal of the Royal Asiatic Society* a paper containing the general results of his researches on this subject. He will, moreover, bring out a complete edition of the *Sulva-sūtras* of Baudhāyana and Āpastamba, with a translation and notes.

SANSKRIT AND PRĀKRIT MSS.

During the meeting a number of Sanskrit and Prākrit MSS. from all parts of India, chiefly selected from the collection of the Royal Asiatic Society, by the Secretary, Professor Eggeling, were exhibited. Some of them were remarkable as beautiful specimens of calligraphy, whilst others, especially two MSS. from Assam on thin, flexible slabs of wood, were interesting on account of the material on which they were written. The most valuable were, however, some ancient Jaina MSS., written on very thin palm-leaves in the Devanāgarī character. Four of these, dated in the twelfth to fourteenth century, were sent home by Dr. G. Bühler, of Bombay, to be shown to the members of the Congress. These, and other MSS. of a similar kind, were discovered by Dr. Bühler during his recent official tour through Rajputana, when a number of most important works were brought to light by him. The collections of the Royal Asiatic Society contain likewise a few MSS. of this kind, viz., the Gāṇarātnamahodadhī, dated Samvat, 1151; the Vivekamanjari, Samvat, 1336; the Chachchari, Samvat, 1204, &c.

INSCRIPTIONS OF THE CHERA AND CHĀLUKYA DYNASTY.

Professor J. Eggeling also read a paper on the inscriptions of the Chera and Chālukya dynasties in Southern India. Of the former line, two inscriptions had hitherto been published in the *Indian Antiquary*, by Mr. L. Rice, dated respectively in Saka 388 (A.D. 406) and Saka 698 (A.D. 776). Among a number of impressions from copper-plate grants, brought home by Sir Walter Elliot, there was a third inscription by another king of that dynasty, dated Saka 169 (A.D. 247). Owing to the great age of this document, it was of considerable importance from a palaeographical point of view, and in it the old Kanāda character, as might have been expected, still showed a good deal of the original square type, which seemed to have belonged to the Indian alphabets when principally used for lapidary purposes. These inscriptions also tended to prove the authenticity of the dates ascribed to several of the kings of this line, in a Tamil treatise called Kongadesacharitam, an abstract of which, from an English translation in the Mackenzie collection, had been published by Professor Dowson, in vol. viii. of the *Journal of the Royal Asiatic Society*. That scholar had felt scruples regarding the accuracy of these dates, on account of the exceptionally high average duration (about thirty-two years) of the reigns of the kings obtained from them; while Professor Lassen, on the contrary, had boldly accepted them as correct. The latter view was confirmed by the inscriptions, the dates of which were quite in keeping with those given in the Tamil work; one of the three grants made by the fifteenth king of that line, and obtained from Merikara, in Mysore, being actually dated in the same year (Saka 388) in which another grant was recorded by the Tamil writer. The personal accounts of several kings in these documents also tended to show that the Tamil work was entirely based on the grants mentioned in it; and we should, therefore, be quite justified in accepting its statement as to the seventh Chera king having been installed at Skandapura in Saka 100 (A.D. 178), and this dynasty having retained their power till about the close of the ninth century of our era, when their possessions passed into the hands of the Cholas.

The remaining portion of the paper dealt with the inscription of the Chālukya dynasty, both the Western and Eastern branches. In the collection brought home by Sir Walter Elliot there were a considerable number of grants—both impressions and original copper-plates—relating to these lines. The deeds of the Eastern kings had one important peculiarity in their favour, viz., that of giving the duration of the reigns from the establishment of that line. The latter event was shown from two dated inscriptions, by which the accessions of the twentieth king Ammarāja II., and the twenty-

fourth, Rājārāja, were fixed respectively in Saka 867 (A.D. 945), and Saka 944 (A.D. 1022), to have occurred in Saka 529 (A.D. 607) or 526 (A.D. 604). The chronology of the Western line, both before and after the foundation of the Eastern kingdom, could not be settled satisfactorily until fresh materials were brought to light. The foundation of the Kalyāni kingdom was ascribed to Jayasinha. Of the grandson of this king, Pulakeśi, there was a grant in the British Museum, dated Saka 411 (A.D. 489), but in Professor Eggeling's opinion there was some doubt regarding the genuineness of that document. Pulakeśi was followed successively by his sons Kirttivarman and Mangalīsa. Of a stone inscription of the latter king, Mr. James Burgess had just brought home impressions; it was dated Saka 500 (A.D. 578), the twelfth year of the king's reign; his accession was thereby fixed in Saka 488 (A.D. 566). The date of the accession of his successor, Satyāśraya, the son of Kirttivarman, was still uncertain. An inscription published by Dr. Bhau Dāji showed that he reigned in Saka 506 (A.D. 584); but another grant in Sir W. Elliot's collection was dated in Saka 534, the third year of the king's reign. This might possibly be a clerical error for the thirty-third year, but even that conjecture did not render the dates of Satyāśraya's successors any less unsatisfactory. A grant of Vikramāditya, his younger son, who succeeded his elder brother Chandraditya, was dated in Saka 530, the sixteenth year of the king's reign; whilst the accession of his son, Vinayāditya, was fixed by two inscriptions in Saka 601-2. These were discrepancies which we could only hope to reconcile with the aid of fresh materials. In conclusion, Professor Eggeling expressed an earnest wish that some systematic plan might soon be adopted to render the inscriptions which alone could be expected to throw light upon the early chronology of India, accessible to European scholars by means of trustworthy copies. In the meantime he hoped that the archaeological surveyors would receive from the Indian Government a sufficient allowance for taking impressions and photographs of all inscriptions within their reach. In the discussion which ensued, Sir Walter Elliot, Mr. Lewin Bowring, late Chief Commissioner of Mysore, Dr. Caldwell and Mr. James Burgess, archaeological surveyor of the Bombay Presidency, severally bore witness, from many years' experience, to the great number and importance of the inscriptions in the Dekhan. In Sir Walter Elliot's opinion the appointment of an archaeological surveyor for the Madras Presidency would not only be an act of justice, but would also supply a very great want.

Professor Martin Haug, of Munich, also read a paper on the Interpretation of the Rig-Veda, which it will not be necessary to report further than by saying that he attaches more authority to tradition than is admitted by the majority of the soundest scholars.

Mr. Bhandarkar, of Bombay, also read a paper on the Nāssick Inscriptions.

Professor Stenzler, of Breslau, then read a paper, of which he has written the following extract,

ON THE HINDU DOCTRINE OF EXPIATION.

A great many of the institutions of the present Indian life may be traced up to their origin in the Vedic times, so as to enable us to observe their development through thousands of years.

This is also the case with the doctrine of expiation, which even this day forms one of the most powerful means in the hands of the priests, for exercising an influence on the people at large.

The word by which expiation is named, *prāyaścitta*, signifies in the old language any remedy for removing a mischief.

When in the course of time the Indian mind had conceived and unfolded the idea of a transmigration of the individual souls through repeated mundane existences, the word *prāyaścitta* came to signify a religious act by which a man might avert the consequences of a sin committed,

which otherwise he would have to suffer in his next birth.

Each particular sin, as it has its definite consequences, so it can only be atoned for by a particular religious act. A later law book, that of *Samvarta*, however, permits a man, who is unable to perform the expiation called *prājāpatya*, to give instead a cow or the value of it in money; and from this allowance there proceeded an appraisalment of the several acts of expiation which seem to be still in use.

Since the prescription of the *prāyaścitta* rests exclusively with the priests, and the fee for their advice as well as the price of the expiation flows into their pockets, this institution forms a chief basis not only of their ascendancy over the other classes of the people, but also of their pecuniary income.

So far the doctrine of expiation and its working is pretty clear.

One point remains which wants further investigation.

Whoever is in the necessity of performing an expiation, in order to choose that one appropriate to his case, must consult a *parishad*, an assembly consisting of ten or of three persons, or even a single person acquainted with the Vedas. Now how is the formation of this assembly effected? or to which single person must the man apply? Do there exist within the civil communities standing *parishads*, or single priests, who are appointed to give advice on expiation? In short, does there exist in the larger communities a kind of ecclesiastical division by which each person belongs to a particular parish, or has, as it were, his especial confessor? The law-books are silent on these questions, and it seems desirable that they should be answered from a nearer observation of the actual Indian life.

In conclusion, it was hinted at the coincidence of the Indian doctrine of expiation with the regulations of the Christian Church of the early Middle Ages, chiefly with those contained in the *Cmones poenitentiales*, composed by Irish, British, and Anglo-Saxon authors. Although this coincidence is striking to a high degree, an historical connexion between them is hardly to be assumed. A narrow comparison of the moral state of the European nations with that of the Hindus, as it is reflected from these works, will, however, lead us to form a just and mild judgment of our brother people on the borders of the Gangā.

Baron de Ravisi also communicated to the Aryan section two papers on the Inscription of the pagoda of Oodeypore, in Malwa, and on the Hindu chronology viewed from a Christian standpoint. At the meeting of the Hamitic section M. de Ravisi presented to the Congress copies of several important archaeological works published in Algeria.

MR. S. P. PANDIT'S PAPER ON "WHO WROTE THE RAGHUVAMSA, AND WHEN."

A doubt has been expressed as to whether the Sanskrit poems *Raghuvamśa*, *Kumārāśambhava*, and *Meghadūta* were composed by the same *Kālidāsa* who wrote the *Sakuntalam* and other dramas. "There is at least some doubt"—says Professor Weber, in his essay on the *Rāmāyana*—"whether we are right in ascribing the *Raghuvamśa* to the author of the dramas and of the *Meghadūta*." In favour of the identity of the two poets is the fact that no one in India has hitherto doubted it, and that the numerous commentators of those works regard them as having proceeded from the *Kālidāsa*—*Mahākavi Kālidāsa*. The *Raghuvamśa* must have been commented upon from a very early period, since many works of that kind were known to *Dinakara* (A.D. 1385) and *Chāritravardhana*. *Mallinātha* also, who flourished about the same time as *Dinakara*, mentions that our poem and the *Meghadūta* were composed by the same poet; and as he also mentions other comments before him, the learned tradition in favour of the identity is of at least 600 or 700

years' standing. It seems highly improbable that a plagiarist, borrowing wholesale from an extensively read, most celebrated, and generally admired author should have succeeded so far in imposing upon a host of keen-sighted critics, lexicographers, and other writers, as to be quoted by them as the model of correctness, elegance, beauty, and originality. There were besides numerous analogies of diction to be culled from the three epics which are characteristic of Kālidāsa. In the same way the dramas showed many striking parallel passages between each other; much less so between the Kāvya and the dramas, as might be expected from the difference of scope and diction of the two kinds of compositions. Independently of the repetitions and analogies of thought and expression (exemplified by a considerable number of parallel passages in the original paper), there is an important fact which not only confirms the inference drawn from these passages, and strengthened by tradition, but which also enables us to form an opinion regarding the age of the common author of all these works. It is the fact that Kshirasvāmin, the well-known commentator on the *Amarakosha*, quotes the *Kumārasambhava*, as well as numerous passages from the *Raghuvamś*, in a manner that shows that both poems were already in his time considered as standard works. It is further stated in the *Rāgataranginī* that Jayāpida, the King of Kāśmīra, who caused the *Mahābhāṣya* to be brought to him from other countries and to be studied in his kingdom, had received his instruction from the professor of the science of lexicography named Kshira Pandita. There can be little doubt that this is no other than Kshirasvāmin, who also composed a grammar called *Kshirataranginī*. The date of Jayāpida varies from A.D. 754 to A.D. 772, according to three different calculations. In an article in the *Zeitschrift der Deutschen Morgenländischen Gesellschaft* for May, 1874, Professor Aufrecht places Kshirasvāmin between the eleventh and twelfth centuries, on the ground that he quotes a glossary under the name of *Sribhoja*, whom Dr. Aufrecht identifies with Bhogadeva, the author of *Sarasvatikanthā-Charnam*, and that he is quoted by Vardhamāna, the author of the *Ganaratnamahodadhī*. Bhogadeva of Dhārā is believed to have lived about the middle of the eleventh century. It is, however, not quite certain whether the author of the *Sarasvatikan-Māhārāṇa* is really the same as the Bhogadeva of Dhārā of the eleventh century, and no glossary is attributed to that prince. Further, the *Sribhoja* cited by Kshirasvāmin is evidently a petty commentator on the *Amarakosha*, and an eminent scholar such as King Bhoga of Dhārā is said to have been would hardly have condescended to write a work of that kind. From Kshira's quotations it is quite clear that he knew only one Kālidāsa. The author of the *Sikantalam* is generally assigned to about the fifth century. The conclusions to which the facts adduced in the paper point are—1. That the Kālidāsa of the dramas was also the Kālidāsa of the poems *Raghuvamś*, *Kumārasambhava*, and *Meghadūta*. 2. That this Kālidāsa is considerably prior to the middle of the eighth century. And 3. That, therefore, all stories connecting him with a King Bhoja, who reigned at Dhārā in the eleventh century, must be rejected as without foundation.

The Rev. Dr. Murray Mitchell presented a paper on the translation of religious terms into Sanskrit and the vernacular of Northern India. After pointing out some difficulties in the rendering of philosophical and scientific terms employed in Europe, he stated that the difficulty was at least equally great with religious terms. He illustrated this by specifying such words as *Redeemer*, *Redemption*; *Paradise*, *Hades*; *Devil*; *the Spirit*; *the Flesh*. Perhaps no text in the Bible was more difficult to render than this, *The Word was made Flesh*. No doubt, Sanskrit was a copious tongue, and the vernaculars borrowed from it; still, to

give the exact meaning of various terms in the Scriptures had been found a task of the greatest delicacy. In the various vernaculars, moreover, there was already springing up a perhaps needless diversity as to the renderings. He submitted a list of about a hundred words with proposed, or tentative, renderings in Sanskrit; and missionaries in India would be most thankful for any aid that this learned Congress could furnish in the great work of rightly conveying to the races of India the religious thought of Christendom.

HAMITIC SECTION (September 17).

The principal communication to this section, after a few words from the President, Dr. Birch, was a lecture delivered in excellent French by his Excellency Brugsch Bey, on

THE EXODUS OF THE ISRAELITES.

The text of the lecture is, we understand, to form part of a book on Egyptian History; but the following abstract, taken down by a competent Egyptologist, has been corrected and approved by the lecturer.

Directed by an order of His Highness the Khedive of Egypt, Ismael Pasha, to come to London in order to represent his country at the International Congress of Orientalists, the desire of this Prince was that I might communicate to the enlightened public of England, who interest themselves in all Biblical questions, the results of my last researches on the sojourn of the Hebrews in Egypt. I have chosen for my theme the exodus of the Hebrews from Ramses to their arrival at Elim. All *savants* who have previously occupied themselves with the reconstruction of this route have taken, as the basis of their researches, the geography of Egypt during the time of the Lower Empire, comparing it with that of our days. As many *savants*, so many different opinions concerning this route; but all, with the exception of two, agree that the Jews went through the Red Sea. My own researches are founded on the geographical indications of Egyptian monuments, contemporary with the time of the Exodus. I was able to reconstruct the Egypt of this epoch, with its forty-two provinces, with its chief towns, and with a very great number of very curious details of the topography and also of its Divine rites. From this I have arrived at the following conclusions, which I consider unquestionable:—

1. That the town of Ramses "differs in no way from the town of Zoan," which is spoken of in the Bible as the place where Moses performed his miracles before the Pharaoh of his time. This is the same town which the Greeks called Tanis, and which was the chief town of the district Tanitis. 2. That the town of Pithom, likewise mentioned in the Bible, was the chief town of the adjoining districts, called by the Greeks the district of Sethroites. The Semitic name of this same town, cited in the papyri of the British Museum, was Suko or Sukoth, which corresponds exactly with the second station at which the Hebrews camped after their exodus from Ramses. 3. The third station, called in the Bible Etham, bears the name of Hetham in the Egyptian texts: the name means "the fortified." This fort was situated westward from the place el-Kantareh (i.e., the bridge) of to-day on the confines of the desert. After having arrived at Etham the Hebrews turned to the north, and arrived then at (4) Migdol, which was the fourth station. The name is completely Egyptian, and means the fortress Magdolon of the Greek and Roman authors, situate at Tel-es-Semout of our day. Setting out from Migdol, the Hebrews camped between Migdol and the sea (i.e., the Mediterranean) before the entrance of the Hiroth (Pi-hahiroth), in face of Baal-Zephon. The Hiroth, an Egyptian term, denotes those fearful abysses situated between the Mediterranean Sea and the Lake Sirbonis. The place of Baal Zephon, in Egyptian Baali Zapouna, is the name of a sanctuary situated at the Casian Mount. As Pharaoh

and his army pursued the Hebrews on this isthmus between the sea and the lake of Sirbonis, to which the inscriptions give, as to all the other lakes as well as to the Red Sea, the name of Sea of Weeds (*yām Suph*) there befel the Egyptians at those places the same fate which, in the course of history, has befallen single travellers as well as whole armies—they were swallowed up by the abysses of the Sea of Algae, or Weeds. Once arrived at Mount Kasios, where was the eastern frontier of ancient Egypt, and where the "way of the Philistines" begins, the Hebrews traversed, in a southern direction, the desert to Marah, "where the water was bitter." These are the Bitter-water Lakes of our day. The sixth station, Elim, is called in Egyptian "A-lin" (i.e., the town of "fishes"), to the north of the Red Sea. All these indications exactly correspond in Hebrew and in Egyptian. No *savant* can separate them from one another, nor alter the site now fixed once for all. The Egyptian papyri and monuments teach us equally—that the Egyptian title of "Zaphnatpanekeh," borne by Joseph, is to be found in Egyptian under the form of "Zaphu-net-phaankh," signifying "The governor of the district Sethroites." 2. That the second title of Joseph, Ab of the Pharaoh, is Egyptian; it signifies "The first officer of the House of Pharaoh." 3. That the town Pithom worshipped God under the name of An, "The Living God," which corresponds exactly with the meaning of the name "Jehovah." 4. That a serpent of brass, called Kereh (the polished), was regarded as the living symbol of God. This is without doubt the serpent of Moses, the worship of which prevailed at Jerusalem until the time of the King Hezekiah. The papyri inform us likewise that the Hebrews, intermixed with other people of Semitic origin, inhabited during their sojourn in Egypt the districts of Ramses and of Pithom; that they were compelled to build certain constructions in both of these towns until Moses delivered them "out of the house of their bondage." As the Jewish legislator performed his miracles before Pharaoh, the latter gave the order to his "khartoumin" (i.e. thaumaturges) to do the same. We meet once more a name which is Egyptian. The word in question signifies "high priests" of the town of Ramses. This coincidence is again perfect. The name of the Hebrews, which some have proposed to compare with a word "Apiru," cited in the Egyptian texts, does not exist in them; at least, nobody has met with it until now. But the name of Moses (in Hebrew Moshé) is to be found in the name of a place called "Isle of Moshé," which is situated on the right border of the Nile, in the Heptanome. The Roman itineraries have designated it by the name of Musac or Mouson. Science cannot decide whether the Jewish legislator was meant, or an Egyptian of the same name.

The lecturer afterwards handed round MS. copies of a valuable geographical list from the pylons of an Egyptian temple, containing the names of the nomes and cities of Egypt at the time to which he ascribes the Exodus.

After a few introductory words by the President, Dr. Birch, a notice was given by Professor Ebers of a great medical papyrus he bought some years ago at Thebes, which he is now about to publish. Then Professor Eisenlohr, of Heidelberg, read a paper on "Egyptian Measures from the Mathematical Papyrus of the British Museum." He determined the age of this papyrus, which is a copy, at about 1700 B.C., the original at 2000 B.C. Professor Eisenlohr extracted from this papyrus a long list of Egyptian corn measures, multiples of the measure *hin*, whose capacity is known as 0.46 litres. He found that the Egyptians had corn measures of 10, 100, 1,000 *hin*, and a very small one of $\frac{1}{32}$ *hin*. Of all these measures he communicated the names and the hieratic signs. Lastly, he spoke of the method which the Egyptians used for bringing out the capacity of vases with circular and with square bases.

ARCHAEOLOGICAL SECTION (*September 18*).

The most interesting feature of the visit of the Orientalists to the South Kensington Museum was the exhibition, in the Art Library, of the splendid collection of calligraphic Arabic manuscripts bequeathed by the late Frederic Ayrton. Asaad Efendi, who formerly travelled with Mr. Ayrton, and who is now (we are happy to state) engaged upon the publication of a catalogue of the Ayrton collection, gave all the information required about the manuscripts.

MR. GRANT DUFF'S ADDRESS.

The section which meets to-day deals with no narrower a subject than the art, architecture, and archaeology of all Eastern countries. A paper on the Mosque of St. Sophia, a paper on the Temples of Kioto, a description of the jewellery of Vizianagaram, and of the palace at Khiva would quite legitimately belong to it. The range of possible topics being thus so enormous, anything like a general introduction to the subject before us would be absurd. A far less ambitious attempt is likely to be more useful, and so I propose to devote most of the time at my disposal to mentioning a few facts which are likely to be new to many of my hearers with reference to the recent progress of Archaeology in India.

I am the rather led to take this course, because the only reason which could possibly induce those who organised this meeting to ask me to preside over our deliberations to-day is that, although I have never had an opportunity of giving much attention to Eastern Art and Archaeology, I have been far longer connected with the government of India than most English politicians. In Mr. Markham's interesting volume, entitled *Indian Surveys*, will be found a very clear and sufficient account of the beginnings of Indian Archaeology, and of its history down to the year 1860, when more primary wants having been supplied, its promotion was first recognised as a regular part of the duty of Government. 1861-62 was the first year of General Cunningham's activity as a Government Archaeological Surveyor, and from that period down to 1866, when the Survey was stopped for a time, he did a great deal of useful work.

In the year 1870 the Survey was re-established under improved conditions by the Duke of Argyll, then Secretary of State for India, and General Cunningham was again appointed to take charge of it. He proceeded to India, organised his staff, and set about his work without delay.

General Cunningham himself visited, during the cold season of 1871-72, a great variety of places in the Gangetic Valley from Mathura to Lakhisarai, and has described the results of his investigations in a long report amply illustrated. He also explored the great Muhammadan cities of Gaur, Sunargaon and Delhi, but the account of these explorations has, so far as I am aware, not yet appeared. By no means the least generally instructive part of his report is the division into groups, which he proposes to make of the archaeological remains of India, which is as follows:—

Hindoo Style.

1. Archæic, from B.C. 1000 to 250.
2. Indo-Grecian, from B.C. 250 to 57.
3. Indo-Skythian, from B.C. 57 to A.D. 319.
4. Indo-Sassanian, from A.D. 319 to 700.
5. Mediæval Brahmanic, from A.D. 700 to 1200.
6. Modern Brahmanic, from A.D. 1200 to 1750.

Muhammadan Style.

1. Ghori Pathan, with overlapping arches, from A.D. 1191 to 1289.
2. Khilji Pathan, with horse-shoe arches, from A.D. 1289 to 1321.
3. Tughlak Pathan, with sloping walls, from A.D. 1321 to 1450.
4. Afghan, with perpendicular walls, from A.D. 1450 to 1555.
5. Bengali Pathan, from A.D. 1200 to 1500.
6. Jaupuri Pathan, from A.D. 1400 to 1500.
7. Early Mughal, from A.D. 1556 to 1628.
8. Late Mughal, from A.D. 1628 to 1750.

In the hot season of 1871, two of General Cunningham's assistants, Mr. Beglar and Mr. Carlleyle explored, under his control, Delhi and Agra respectively, and reported very fully upon these cities, dwelling, of course, chiefly upon what was not supplied in previous accounts.

In his report on Delhi, which was published this year at Calcutta, Mr. Beglar argues in favour of the opinion that the famous Kutb Minar is of Hindu origin, an opinion from which General Cunningham emphatically dissents in a preface to his assistant's report. Mr. Beglar also believes that the Hindus had a much larger share in the architecture of the Kutb Masjid, as it now stands, than his superior officer will admit.

General Cunningham observes: "In the following report Mr. Beglar admits that the pillars have been more or less re-arranged, but he contends that they occupy their original positions in the colonnade of a single Hindu temple, and that their present height is exactly that of the original Hindu colonnade. Consistently with this view he is obliged to condemn the record of the Muhammadan builder of the Masjid, regarding the destruction of twenty-seven Hindu temples as a false boast.

"This opinion I consider as quite indefensible. The Muhammadan conqueror could have no possible object in publishing a false statement of the number of temples destroyed, nor in recording a lie over the entrance gateway of his great Masjid. I therefore accept the statement as rigidly true. It is, besides, amply confirmed by the made up pillars of the colonnades on three sides of the court, which, as I have shown in my account of Delhi, must certainly have belonged to a great number of different temples."

I should be curious to know whether any one present who is acquainted with Delhi would subscribe to the following verdict of Mr. Beglar's, who is throughout less complimentary, as it appears to me, than his predecessors to the earlier Muhammadan architects.

With regard to this question, as well as to General Cunningham's division of the styles, it would be extremely interesting to hear the views of Mr. Fergusson, whose long and distinguished labours in connexion with Indian architecture are known to everyone, and for a fitting presentment of whose remarkable work on Tree and Serpent Worship the India Office deserves, I think, some credit. After describing and criticising the Alai Darwaza, Mr. Beglar says:—

"How great is the difference between the Hindu Kutb and this gateway. There not a line of ornament is introduced that does not point and emphasise some constructive feature; every feature there has an office to perform, and performs it well; it is emphatically a structure possessing harmony. The Alai Darwaza, on the contrary, has little of architectural ornament, and owes its beauty more to the carvings executed by Hindu workmen, the last expiring effort of Hindu art in Delhi, than to any remarkable harmony of arrangement.

"Indeed, on *a priori* grounds we should expect this want of appreciation of truthful ornamentation among the Muhammadans, a barbarous and warlike people, whose religion narrowed their minds, naturally none of the most liberal, and demanded the suppression of æsthetic feelings. They could not be expected to reach a high standard in architecture within a short time, still less then could they be expected shortly after their conquest of India to produce structures worthy of admiration for harmony; and this is precisely what has happened, for with all the aid of elaborate ornamentation, carved, be it remembered, by Hindu hands, they have not produced any structure which commands admiration independent of mere beauty of ornament (for which the Hindu workman deserves credit), or of sheer greatness of size; and as soon as they attempted to build without the aid of Hindu workmen, they produced what certainly is grand from sheer massiveness, but what is utterly devoid of that combination of

qualities which produces in our minds the idea of beauty, independent of colour, carving, material, or mass. It is only after the Mughal conquest that Muhammadan architecture begins to be beautiful."

I have not myself seen these buildings, though I trust to have done so before many months have gone by, and should like to hear what some of those present have to say about these criticisms.

In the cold season of 1871-72 Mr. Beglar examined a number of places between the Jumna and the Narbudda, to the south-east of Agra, but his report, if published, I have not yet seen; nor have I seen the result of Mr. Carlleyle's explorations in Rajpootana during the same period.

In the cold season of 1873-74 the greater part of the Central Provinces was explored by General Cunningham and Mr. Beglar, the former of whom made, at a place called Blarahun, 9 miles to the south-east of the Sutna railway station, and 120 miles to the south-west of Allahabad, some very remarkable discoveries.

When Professor Müller in the course of the noble address which he yesterday delivered to us (and which again and again forced me to think of a remark which the great Alexander von Humboldt made to me at Berlin, rather more than twenty years ago, that, namely, it was an honour to England that she afforded a career to such men.) approached the subject of these discoveries I confess I was somewhat horrified. Why, I said, here is the unhappy President of the Archaeological Section going to be robbed of the most interesting fact which he had to state. Happily, however, my great Aryan colleague only alighted upon the fact for one moment—fertilising it, no doubt, when he did so, like one of those insects to which Sir John Lubbock gave the other day at Belfast a new interest, as the hon. member for Maidstone is apt to do to everything he touches.

And so I dare say it will not be amiss if I give some part of General Cunningham's own account of what he has done:—

"In our maps the place is called Bharaod, and I believe that it may be identified with the Baodaotis, of Ptolemy. It is the site of an old city, which only sixty years ago was covered with a dense jungle. In the midst of this jungle stood a large brick stupa, 68 feet in diameter, surrounded by a stone railing, 88 feet in diameter and nine feet in height. The whole of the stupa has been carried away to build the houses of the present village; but rather more than half of the stone railing still remains, although it has been prostrated by the weight of the rubbish thrown against it when the stupa was excavated. When I first saw the place, only three of the railing pillars near the eastern gate were visible above the ground, but a shallow excavation soon brought to light some pillars of the south gate, from which I obtained the measurement of one quadrant of the circle. I was thus able to determine the diameter of the enclosure, the whole of which was afterwards excavated, partly by myself and partly by my assistant Mr. Beglar. In many places the accumulation of rubbish rose to eight feet in height, and as the stone pillars were lying flat underneath this heap, the amount of excavation was necessarily rather great; but the whole work did not occupy more than six weeks, and all that now exists of this fine railing is now exposed to view."

And again:

"Amongst the scenes represented, there are upwards of a dozen of the Buddhist legends called Jatakas, all of which relate to the former births of Buddha. Luckily, these also have their appropriate inscriptions, or descriptive labels, without which I am afraid that their identification would hardly have been possible."

"I look," continues General Cunningham, "upon the discovery of these curious sculptures as one of the most valuable acquisitions that has yet been made to our knowledge of ancient India. From them we can learn what was the dress of all classes of the people of India during the reign of Asoka,

or about three-quarters of a century after the death of Alexander the Great. We can see the Queen of India decked out in all her finery, with a flowered shawl or muslin sheet over her head, with massive ear-rings and elaborate necklaces, and a petticoat reaching to the mid-leg, which is secured round the waist by a zone of seven strings, as well as by a broad and highly ornamented belt.

"Here we can see the soldier with short curly hair, clad in a long jacket, or tunic, which is tied at the waist, and a dhoti reaching below the knees, with long boots, ornamented with a tassel in front, just like Hessians, and armed with a straight broad sword, of which the scabbard is three inches wide.

"Here, also, we may see the standard-bearer on horseback, with a human-headed bird surmounting the pole. Here, too, we can see the king mounted on an elephant, escorting a casket of relics. The curious horse-trappings and elephant-housings of the time are given with full and elaborate detail.

"Everywhere we may see the peculiar Buddhist symbol which crowns the great stupa at Sanchi used as a favourite ornament. It forms the drop of an ear-ring, the clasp of a necklace, the support of a lamp, the crest of the royal standard, and the decoration of the lady's broad belt and of the soldier's scabbard."

In a recent paper in the ACADEMY, Professor Müller gave a warning on this subject, which he did not repeat yesterday, but which seems important. "Much depends," he said, "on the date of these ruins, and here it is impossible to be too cautious. General Cunningham assigns them to the age of Asoka, 250 B.C., chiefly, it would seem, on account of the characters of the inscriptions, which are said to be the same as those found on the Sanchi stupa. But to fix the date of a building in India by the characters of the inscriptions is a matter of extreme difficulty. The letters used for the earliest Buddhist inscriptions soon acquired a kind of sacred character, and were retained in later times, just as in Europe the old style of writing is preserved on architectural monuments of a later age. With all respect for the learning of those archaeologists who unhesitatingly fix the date of any building in India by its architectural style, or by its sculptures and inscriptions, we sometimes wish that they might imbibe a little of that wholesome scepticism which Sanskrit scholars have acquired by sad experience. If, however, the date of the Bharhut ruins should prove beyond the reach of reasonable doubt, we should have in the sculptures and inscriptions there found a representation of what Buddhism really was in the third century B.C."

So much for the work of General Cunningham and his assistants, but their work did not stand alone.

In October 1871 the Duke of Argyll called the attention of the Bombay Government to the importance of the production of a complete survey of the rock temples of Western India; and after some correspondence Mr. Burgess was appointed to conduct an archaeological survey in that Presidency. He entered on his duties in January of this year, and in three months had returned to Bombay, bringing fifty-four photographs, between twenty-five and thirty inscriptions, about forty ground-plans, sections, drawings of columns, &c., and forty sketches of sculptures. I understand that Mr. Burgess is at present engaged in drawing up a report upon these. If the results turn out as satisfactory as there is reason to expect, I hope the Government of India may see its way to allotting rather more money than it has yet done to the investigation of the archaeology of Western India by so active and competent an observer.

Perhaps Mr. Burgess, who is in the room, will be prevailed on to address us to-day.

These, gentlemen, are the most recent doings of our official archaeologists in India, and I am convinced that with every decade we shall have a better and better report to give of the care which is being bestowed by the present rulers of India on the works of their predecessors.

We are fond of denouncing ourselves for want of proper care of these matters. There are few things that Englishmen like so little as being denounced by other people, but there is nothing that they like so much, as denouncing themselves. Coolheaded observers, however, looking at the enormous amount of absolutely necessary work that had to be done before the first beginnings of a civilised polity were laid in India, which was rapidly going to utter ruin when we first grew strong there, will be inclined to condone our insufficient attention to the preservation and illustration of ancient monuments in the past, if we only now attend to them sufficiently; and having had the opportunity of seeing a good deal behind the scenes in matters Indian, I think I may say, very positively, that we consider ourselves more and more in matters relating to science, art, and literature in India, as trustees not only for our own countrymen, but for the whole civilised world. That is a view which I strongly hold myself, and which, should circumstances again place me in an influential position in connection with the Government of India, I shall always do what I could to carry into effect.

I had hoped at one time that a building which should have contained the India Museum, the great Indian Library, and rooms for the Asiatic Society, might have risen at Westminster as a fitting monument of the presence in the India Office of the Duke of Argyll, the one man of high scientific attainment whom the conflicting tides of English politics ever carried into the great place of Secretary of State for India.

The fall, however, of the Gladstone Government swept the Duke of Argyll away from the India Office, just as the great deficit of about six millions which he found upon attaining to power, a deficit for which I ought in justice to mention hard times, and not his predecessors, were responsible, had under his auspices been filled. I trust that the realisation of my hopes will be only deferred, and am well content that if the thing is done the honour of doing it should belong to our successors in power.

I hope some of our visitors from the other side of the water have taken, or will take, an opportunity of visiting the India Museum. They will find it under the care of Dr. Forbes Watson and Dr. Birdwood, although in an inconvenient locality, extremely full of interest. Among other things, their attention should be directed to the system by which Dr. Forbes Watson has tried to diffuse amongst our manufacturers a knowledge of the beautiful textile fabrics of India, so incomparably superior, from an aesthetic point of view, to anything which the looms of Western Europe have yet produced.

Before concluding, I wish to mention to our foreign visitors the paper which is published by the India Office every year, giving an account of the "Moral and Material Progress of India." It is very little known upon the continent of Europe, and its wider diffusion would, I think, correct many errors about our doings and not doings in the East, which are rather widely prevalent. It can be obtained through any respectable bookseller in London, and is extremely cheap.

Thanking you for the kindness with which you have listened to this address, I now declare the section of Eastern Art and Archaeology to be open.

The principal subject which occupied the attention of the Archaeological section of the Oriental Congress on Friday, the 18th, was a motion proposed by Mr. E. T. Rogers, late H.B.M. Consul at Cairo, and seconded by Mr. Stanley Lane Poole, "That this section nominate a committee of gentlemen, with power to add to their number, for the preservation and restoration of monuments of Oriental art and architecture, and for duly recording those monuments which are decaying and which cannot be restored." Brugsch Bey endeavoured, but not very successfully, to show that

European travellers were most to blame in the matter of the destruction of the monuments, and drew a humorous picture of the defacement of the buildings, by English names scrawled over them with no great reference to calligraphic effect, and proposed that in order to put a stop to these acts of vandalism a list of culprits should be published annually, containing the names of all those travellers who had endeavoured to obtain a sorry immortality by thus defacing the monuments. Professor Ebers, of Leipzig, proposed that a system of watchmen should be organised for the protection of the monuments. After this the motion was carried almost unanimously; but its form was slightly modified by being referred to the consideration of the Council of the Congress, with the recommendation of the section, instead of being acted upon by the section itself.

ETHNOLOGICAL SECTION (September 19).

PROFESSOR OWEN'S ADDRESS.

With diffidence and misgiving I have yielded to the wish of our President, my esteemed friend and colleague, Dr. Birch, to undertake the honourable and responsible office of President of the Ethnological Section of the Congress of Orientalists, now assembled in London. These feelings naturally arise from consciousness of the slight relation of my habitual studies to the immediate objects of the present distinguished assembly. Some results of ethnological observations in Egypt, submitted this year to the Anthropological Institute, and previous reports to the British Association, on lower, probably older, more Eastern races, form the narrow ground for a claim to be regarded as a fellow-labourer in the work which so many more eminent ethnologists have here met together to promote. But if my help in your great aim be small, my grateful sense of the value of your consideration, and more especially of your teachings, is deep and genuine. In presence of the distinguished founder of this Congress, Professor Léon de Rosny, I am at once reminded of the vast debt which physical ethnology owes to the bold yet true views originating in French intellect and on French ground, whereby first was broken down the barrier that had arrested our estimate and conception of past time in connexion with the existence of the human race and the origin of its varieties. The name of Boucher de Perthes is wedded imperishably with this discovery; and that of the late estimable and indefatigable Ed. Lartet is closely associated therewith, through his confirmation and expansion of the insight of the philosopher of Abbeville into the true meaning of the geological and palaeontological phenomena of his neighbourhood. Worthy successors have these great names found in living French ethnologists, of whom De Quatrefages and Paul Broca may be cited as types. To acknowledge the value of the labours, researches, genius of the philologists of Germany would be too hard for me were I to aim at adequacy. Ethnologists feel their indebtedness thereto at almost every doubtful point in the track of enquiry, more especially when it leads eastward. I am happy to believe that no country has more willingly discounted the German claims for such indebtedness than England, or has with more pleasure made a home welcome and acceptable to the distinguished linguistic philosopher who may honour another than the Fatherland, as a notable one has done this island in choosing it for a continuous residence and field of research and instruction. But there is a mighty empire to the east of Germany, whose services to ethnological science are perhaps less known and appreciated in England. Every conquest in the heart of Asia by Russian valour, endurance, and military skill has also borne its scientific fruit, has been attended by the peaceful victories of ethnology; more especially as regards the linguistic evidences which lie at the foundation of the dark problems of beginnings and affinities of races. A vocabulary or grammar of some Finnish or other

dialect speedily follows the track of the invading force. Some score of established varieties of speech budding out of Finnish roots have been the fruit of painstaking researches of a people in whom the faculty of easy acquisition of foreign languages seems innate. The philological works of a Castrén, Sjögren, Scheffren, Wiedemann, Middendorf, crown those names with honour; their contributions enrich almost each successive volume of the Transactions of the Imperial Academy of Sciences of St. Petersburg—a mine of wealth which amply rewards the exploration of the ethnological student. One wishes that such a scientific staff could have followed the track of our victorious troops in Abyssinia and Ashantee, and the example of Russia we may hope to be followed in future manifestations of the power of Great Britain among remote, primitive, and little known races of mankind. That example has been followed—rather, I should say, anticipated—by distinguished scholars, warriors, administrators in our great Indian Empire. The contributions to ethnology which enrich the Transactions of the Royal Asiatic Society amply attest the sympathy of the rulers of India with the aims of science. The like testimony will be found in the valuable and original memoirs published by cognate associations in the capital cities of India. To the present centralised administration of India ethnology is indebted for the issue of descriptions and photographs of the various races, castes and outcasts, traders, labourers, soldiers, outlaws, &c.; natives of the vast territories of that mighty conquest. It is known to ethnologists, and partly explicable by the physiologist, that the portrait artist cannot perfectly succeed with the face of a race different from his own race. In the most finished and costly illustrations of voyages and travels by European experts, with aid from Governments, the portraits of Aborigines proclaim almost as well as the title-page the nation of the artist. A Papuan, *e.g.*, will have a French, German, or English cast of physiognomy, according as he has sat to a limner of one or other country. Formerly honoured by conversing on this matter with the Prince Consort, his Royal Highness was pleased to show me a collection of ethnological photographs, which, at his instance, and for that reason, had been made for him by officers capable of practising the wonderful art in remote lands. A like encouragement has been held out to the accomplished officers of the Indian Service, and already the result rises to five quarto volumes (1872) on *The People of India*, edited by J. Forbes Watson, M.D., and John William Kaye, K.C.S.I., F.R.S., with instructive notices of the subjects of the photographs. This great work and priceless contribution to Eastern ethnology has been brought out in its present elegant form at the India Office, under the auspices of the late Minister for India, his Grace the Duke of Argyll, with whose name may be associated, as a recipient of the acknowledgments of ethnologists, that of the late Secretary for India, my colleague in this Congress, and esteemed friend, the President of the Archaeological Section. Of home ethnologists, more especially those who have brought to bear linguistic attainments upon man's ancient history, I need not allude to those who share with us our present work, but I may be permitted to name Robert Gordon Latham, F.R.S. The noble edition of our classical English Dictionary places the name of its author alongside the imperishable one of Samuel Johnson; but Latham's original works give him a distinct and lasting pedestal of fame as an elucidator of the affinities of human races. May we recognise it as a tribute to British contributions to ethnology that London has been honoured this year by the presence of the most distinguished Continental labourers in the field of science? For myself, as an archaeologist, I belong to that other species defined by my master in palaeontology, the immortal Cuvier, *antiquaire d'une nouvelle espèce*, &c.; and my habitual researches relate to periods

transcending those expressed by the terms of historical estimates of past time. In that relation mainly stand the few studies I have been able to devote to the proper subjects of the present section, and perhaps the sole service I may render to the Congress is to exemplify hindrances to the progress of geology which possibly may still tend to divert from its true course the science of Oriental races and families of mankind. The Papuans of New Guinea, with cognate dark-skinned, crisp-haired, prognathic peoples of Australia, New Hebrides, New Caledonia, and neighbouring islands, bespeak by affinities of their rude dialects, as well as by physical characters, a low and early race of mankind, which, in some respects indicating kinship with the Boschismen of South Africa, are yet sufficiently distinct to suggest a long term of existence in another and distant continent. Zoological and geological evidences concur, as in a degree exemplified in Wallace's *Malay Archipelago*, to point to a prehistoric race of mankind, existing generation after generation on a continent which, in course of gradual, non-cataclysmal, geological change, has been broken up into insular patches of land: there such race is still open to ethnological study. Wending westward to regain the proper field of our Congress, we have evidences of as early—if I say "primitive," it is because we know none earlier—bipeds in the trans-Gangetic peninsula and Indonesian Archipelago. These Nigritos, in India, have fled before invaders from the sub-Himalayan range, represented by Burmese and Siamese; before invaders from the south, the Malays, with their maritime advance in civilisation; before later immigrations from the north, with the religion and literature respectively of the Aryan Hindoos and the Arab Mussulmans. Fragments of the dwarf Nigrito stratum may be picked up—a scanty one in Engomho, the largest island off Sumatra, in the Mergui Archipelago, in the Nicobar Isles, and in the Andamans. The Nigritos, who have survived such changes, and have been caught, so to speak, upon a new continent, have preserved themselves in mountain fastnesses and forests, have fled before later immigrants, have never assimilated therewith, have always been looked upon by them as prior in time, and now are verging towards extinction. In speculating, therefore, on the place of origin of Mincopics and hill-tribes, I would impress upon ethnologists to set aside ideas of the actual disposition of land and sea as being necessarily related thereto, and to associate with the beginning of such low forms of humanity a lapse of time in harmony with the latest geological changes of the earth's surface. In such observations, *e.g.*, as the estimable voyager Wallace uses, when he remarks on the high probability that the "Nigritos of Bengal have had an Asiatic rather than a Polynesian origin" (*op. cit.*, vol. ii. p. 424), no facts supporting the assumption of such degree of probability have come to my knowledge. On such as have, I infer that the birth-land of the Mincopics, *e.g.*, was neither Asiatic nor Polynesian as these terms are understood in modern geography. A contributor to the Transactions of the Asiatic Society of Bengal writes:—"Some may be of African origin or of mixed African descent; their woolly hair and other signs apparently afford such a solution." (Mr. Day, F.Z.S., *Observations on the Andamanese*, June, 1870, p. 153.) The question of the African origin I have sounded in my *Report on the Physical and Mental Characters of the Mincopics in Reports of the British Association*, 1861. As to the hypothesis that "the Mincopics and Australians are not a pure race, but hybrids between true negroes and a Malayan or yellow race" (Quatrefages, *Unité de l'Espèce Humaine*, 12mo, 1861, p. 173), I will only repeat my remark—"the cardinal defect of speculators on the origin of the human species seems to me to be the assumption that the present geographical condition of the earth's surface preceded or co-existed with the

origin of such species." (*Reports of British Association*, 1861, p. 8.) The Andamanese, or Mincopics, of whom I exhibit photographs, suggest the same relations to geological change of surface as the Papuans. Their islands are in the Bay of Bengal, but so much as may be deduced from their poor, unsettled language shows relationship with the Môn or Peguan dialects rather than with the continental Burmese living on the coast nearest the Andamans. I infer that the now island homes of the Mincopic race were above water before the nearest continent assumed its present size and shape. The fossils of giraffes and hippopotamuses in newer tertiary deposits on slopes high up the Himalayas significantly point to the (geologically) recent elevation of that grand mountain chain, and therewith probably to the movements resulting in the present configuration of the southern Asiatic land. Notwithstanding their proximity to the mainland and to the course of Indian traffic, the Mincopics maintained themselves, until the needs of the Mutiny war led to one of their islands becoming a penal settlement, apart from higher races of mankind. These races had till then failed, as they still fail with the Papuans of New Guinea, to get a footing and begin the work of elevation of the aboriginal race. This arises from the unmitigated, uncompromising hostility, by force and fraud, to any invaders, accidental or intentional, whom they had it in their power to extirpate. Such hostility, hatred, and dread can only be compared with that which the brute species in a state of nature entertain towards man. An island of *quadrumanus* would conduct themselves, to the extent of their destructive and repellent faculties, in like fashion towards biped immigrants. The Mincopics, like the Papuans, seem to realise instinctively their fate through contact with a higher race, by which, however benevolent the intention, such fate would be to be improved, like the Tasmanians, off the face of their native land. Our countrymen, since the occupancy of one of the islands, have done their utmost to raise and civilise the natives. Young female Mincopics have been taken in hand by kindly-disposed ladies, have been dressed and trained as English girls. Some of the scholars tried to get back to the larger island by swimming. Of those retained to the time of puberty and then returned to their tribe, all threw off their European clothes and reverted to the simple pudendal leaf, and they showed no sense of shame before their teachers. The cincture of the males—three or more girths of a strong flexible tendril wound round the abdomen—leaves the generative organs conspicuous, as in the photographs; and of such nakedness they have a perfect prelapsarian, speaking theologically, or, speaking zoologically, quadrumanous, unconsciousness. Of ideas of another life there are glimpses. The widow dreams of her dead husband; to the widower, in his slumber, returns his departed wife; the pangs of hunger and the thoughts of successful chase excite the vision, in which a deceased notable hunter or fisher revisits the dreamer, and an unusual haul of fish or capture of game is the result. This seems to be the foundation of faith in a future life of successful chase and cessation of hunger pangs. The widow carries about with her till remarried the skull of her deceased spouse. The Australian widow is more practical, and converts the cranium into a drinking vessel. I cannot obtain from friendly residents, though whom I receive materials for studying the Mincopics, any fact or evidence of an "inherent impulse moving them to turn their thoughts and questionings towards the sources of natural phenomena." Such impulse may arise after primeval man has made the requisite advance. But the subjects of Oriental ethnology represented in the photographs exhibited stand on a lower step, and even these may be primeval only in the sense that we have not yet got evidences of still inferior bipeds. There is, of course, another hypothesis which may commend itself to a few of my hearers, as it does to a large proportion of the reading classes of this

country. It is that which, in the terms of the Ven. Archdeacon Squire, would affirm that the Andaman Islands, like Egypt, were "colonised about 130 years after the Flood by emigrant Asiatics, descendants of Ham or Cham, the son of Noah." Such hypothesis the Archdeacon rests upon "the Scriptural account of the general destruction of the world by the Deluge, which all Christians admit, or at least ought to admit" (Preface to the Translation of Plutarch, *De Iside et Osiride*, p. v). Fain would I have found facts to square with this conscience-enforcing principle, and hard was the struggle against the prepossessions of sacerdotal education in being brought, by the course of daily duty, face to face with phenomena subversive of the idea of the distribution of mankind from the plain of Shinar at the biblical date of the building of Babel. The evidences of the antiquity of man in Europe, discovered, with a glimpse of their significance, by Tournol and Christol in 1826; by Schmerling, with more insistence of their meaning, in 1833; rightly discerned and persistently advocated by Boucher de Perthes in 1838, finally confirmed by Prestwich, have multiplied to demonstration. I will only remark that the shell mounds of the Andaman Islands exemplify the grade and mode of existence of stone-weaponed humanity at this day, identical with that of the accumulators of "kitching middens" in the North of Europe in pre-historic times. My latest ethnological observations relate to the race that founded the civilisation of ancient Egypt. Permit me briefly to premise evidence of the antiquity of the subjects on which those observations were made. The want of this preliminary has vitiated studies akin to my own, and far superior to them in extent and devotion of research. I allude to the vast body of illustrations of the craniology of mummified Egyptians, with which the honoured name of Morton is associated. The subjects of his conscientious and accurate observations had been gathered in the great graveyards and labyrinthic sepulchres of Egypt, but of their relation to any given reign or dynasty there is little or no evidence—none certainly that can be called reliable in regard to the first six dynasties. The skulls figured in Morton's great work are of ancient Egyptians, it is true, but of such as may have died at any period of a range of some 4,000 years. My studies are not merely of skulls, but of them clothed with flesh; not of their dead remains only, but I may say of the living men and women contemporary with kings of the Third, Fourth, and Fifth Dynasties. Portrait sculpture had advanced to such perfection at that remote period that each individual of upwards of fifty statues, from the sculpture closets of family tombs, has its distinct individual physiognomical character, and would be worthy of the study of a Lavater, and they unquestionably impressed me with the conviction of their faithful likeness to the individuals named. Associated inscriptions in the tombs yielding these precious ethnological evidences give the reigns of the Phras under whom they lived and died. It remains to determine the period of such reigns and the relation of such period to the comparatively small amount of the history of ancient Egypt that can be paralleled with determined periods of the contemporary history of other nations. No documents are more important in ethnology, or the scientific history of races, than those which we owe to the most philosophic and knowledge-loving of the Pharaohs of the Greek dynasty—the records, viz., written and preserved by the hereditary priesthood of Egypt and of Judaea respectively. Through Ptolemy Philadelphus these first, by the Greek translations he caused to be made, became the property of the human intellect. In the evidences and beliefs of the respective antiquities of these people so recorded there was great discrepancy. Egypt had risen from a long, misty, mythical period to a kingdom ruled and administered by one mortal Phra or Pharaoh, at a period of time, according to

Manetho, contemporaneous with the creation of the world according to Eedras. A later Phra (Khufou-Cheops) was building his pyramid, according to the Egyptian chronicle, when the whole world was under the waters of a universal Deluge according to the Hebrew chronicle. What ought to be the attitude of the ethnologist before the Manethonian and the Septuagintal documents? As an investigator of the relative dates, periods, nature, and causes of the changes in the crust of our globe and of the organisms which have worked the vital form of force thereon, I must answer, to cast away all partiality to the respective authorships of those documents, all assumption or presumption of the superior claims to recognition of the origin of the one or of the other, to test them by facts which are open to discovery, and on which the truth-getting faculty of man can found scientific conclusions. The ethnologist can no otherwise attain to durable results. In regard to the Hebrew document this test has been comparatively recently applied by the Organisation or Society in the initiation of which I gladly took part, known as the "Palestine Exploration Fund," and the results already obtained have been most acceptable to Biblical scholars. A like investigation of the remains of edifices, works of art, monumental records akin to that on the "Moabite stone," has been carried on in Egypt for a longer period and with richer results. Gladly, and feeling it a high privilege, do I avail myself of this opportunity to express my homage of gratitude to Lepsius, my deep sense of the inestimable value of his services devoted to Egyptology, in trying travel, with risks to life and health, guided by the highest linguistic attainments, especially of the hieroglyphic characters, and by the rare gift, instinctive as it seems, of the discoverer, in the discernment of signs of light not caught by the eyes of ordinary travellers. And most ungrateful should I be if I did not, at the same time, acknowledge my deep indebtedness for such ethnological fruits as I may have gathered in my own travels and sojournings in Egypt to the worthy successor of Lepsius in the researches most essential to our estimate of Manetho's lists—I allude to Auguste Mariette Bey, the present Director of the Service of Conservation of the Antiquities of Egypt; the founder, arranger, curator, and expositor of the Museum of Antiquities in the Petrine Babylon, now a suburb of Cairo. From the specimens with which he has enriched that museum are the photographs I now exhibit taken. Believing that the succession of kings and dynasties could in a great degree, and will in a fuller one, be worked out on evidence of Egyptian antiquities, yet the periods or durations of reigns rest on the Manethonian lists. Were the records yielding such lists true? The following have afforded the most instructive tests and answers to the question: 1st, the Turin Papyrus, or list of rulers of Egypt from the Mythical Period to the Nineteenth Dynasty; 2dly, the Karnak Tablet, or fresco of Thothmes III., now in Paris; 3dly, the like monument of Rameses II., from Abydos, in the British Museum; 4thly, and above all, the mortuary inscription from the tomb of the priest Tounar-i, now in the Museum of Boulak. Such help as can be gleaned from the fragments of the first in testing the transcribed record of Manetho confirms it. The second has helped to determine the names of the kings of the Thirteenth Dynasty, again, in the main, in accordance with Manetho, not contradictory. The third document yields sure grounds for the classification of kings of the Eighteenth Dynasty, and served, under the sagacious study of Lepsius, to determine the place in Egyptian history of the classical Sesostriis—the Sesortasen or Osirtasen of the grand Twelfth Dynasty of the Ancient Empire. In their results, so far as they can be applied to test its accuracy, the summary of the Sebhenytic Scribe, and the sacred chronicles which he translated, come out as veridical. The most regrettable deficiency in

our "Table of Abydos" is the commencement of the series of defunct ancestral Phras to whom Rameses pays homage; for what testimony more conclusive of the genuineness of the lists of kings and reigns preserved in the priestly archives could be adduced than that the names of such kings and the numbers of dynasties, reigning, according to those archives, from 5,000 years to 4,000 years B.C., and quoted by the Royally-entrusted Scribe 300 years B.C., should tally with the lists recorded by a priest who died in the reign of a Rameses 1,400 years B.C.? It is truly marvellous, and of priceless value to the Egyptologist, that such records should have been handed down, faithfully chronicled, and safely kept, through 4,500 years of vicissitudes, changes of dynasties, usurpations, wars, invasions, destructions, and partial conquests of the land of Egypt. May I trespass with a few words on the monuments from Sakkara, which, with the Statute of Cephren, is of itself worthy of a visit to Cairo? The epitaph or mortuary inscription discovered by Mariette in the tomb of the high priest Tounar-i, who lived and died in the long reign of Rameses II., proclaims the defunct to be "justified" and privileged to enter that heavenly mansion to which defunct kings were admitted. Of this august assembly the Priest gives fifty-five names. No doubt these fall short of the number recorded by Manetho as succeeding each other between Menes and Rameses, but then Tounar-i saw only the "justified kings." Neither Thothmes nor Rameses admitted indiscriminately all their predecessors in their complimentary frescoes. But the touchstone in the Sakkara tomb is this—it gives the names of two kings of the First Dynasty, of six kings of the Second, of eight kings of the Third. Those names occur in the Manethonian List, as submitted to a monarch of the Thirty-third Dynasty. It is trite to comment upon the usage of Manetho's previous record by Jewish and early Christian writers. He was charged with making dynasties successive which had been contemporary, &c.; but this was imputed on no foundation of observed facts, simply on the assumption that a certain chronology, resting on no scientific basis, must be accepted as being a Divine revelation, and any statement opposed thereto must be put down or explained away. So a living professor of history, in reference to Syncellus's reduction of Manetho's chronicle to 3,555 years before the conquest of Egypt by Alexander, remarks:—"Even this view, however, seems to be extravagant, for it places the accession of Menes in the year B.C. 3,853, which is considerably before the Deluge according to the highest computation." (Rev. Canon Rawlinson, *Translation of Herodotus*, vol. ii., note ii., p. 1.) Neither Josephus nor Eusebius understood the hieroglyphical characters, but an historian of the present day has not this excuse for closing his eyes to the evidence of the monuments of a people who excelled all others in the pains they took to leave imperishable records of their annals. Manetho stands before this testimony and waits judgment. If, for example, statues and laudatory memorials of the kings of a Memphic dynasty were found only in Lower Egypt, and those of kings of an Elephantine dynasty only in Upper Egypt, there would be grave ground for suspicion that the Egyptian priest had aggrandised the rule of both series of limited monarchs, and had lengthened out their history by making certain dynasties successive which had, in fact, reigned contemporaneously. There were periods, indeed, when Upper and Lower Egypt had respectively their own Pharaohs, but the normal relations of such were hostile. Manetho records such conditions of the Monarchy, and notes some of the Theban kings as contemporaries of the Shepherd Kings reigning at San. But a Pharaoh of the lower country permitted not his usually hostile contemporary in the upper country to dedicate to himself monuments at Tanis; nor would a Theban king permit a Ilvckos one to set up his image at Elephantine. The discovery, therefore, by Mariette of such monuments of one and the

same Pharaoh, or dynasty of Pharaohs, occurring the whole length of Egypt, from north to south, is a scientific fact testifying to the truth of the lists of the Egyptian priests. They have proved, for example, the Sixth Dynasty, which chose for its capital Elephantine, to have succeeded the Fifth Dynasty, which chose for its place of business Memphis. They have similarly and satisfactorily demonstrated the Fourteenth Dynasty of Xoïs to have succeeded, in time, the Thirteenth Dynasty of Thebes. In sum, the study of these various testimonies, and especially of those later ones, which have tempted me to repeat three times my first visit with his Royal Highness the Prince of Wales to Egypt, has begot a conviction that the chronology I have the honour to exhibit to the present section best squares with the sum of scientific evidence at present bearing upon it. In illustration of the most ancient of the civilized Egyptians, I submit to your inspection the following:—1. A photograph of life-size statues of a Prince and Princess, relatives of the last King of the Third Dynasty, near whose pyramid at Mejdoun was their sepulchre. The hieroglyphics have a certain simplicity, not to say rudeness, in accordance with this high antiquity. 2. Next, the photograph of a life-size statue of Cephren, a Phra of the Fourth Dynasty, builder of the second Great Pyramid at Ghizeh. One cannot fail to be impressed with the individuality of this noble piece of sculpture. The King is seated on a simple but elegant throne, the whole carved out of one slab of the rare, beautiful, and most intractable mineral diorite. The face, with European features, refined, intellectual, has a calm, dignified expression, free from the conventionality of the statues of later monarchs, the anatomy of the frame as true as in such work from the chisel of Michael Angelo. What was the period of incubation of Egyptian sculpture before reaching such perfection in both the creative and mechanical parts of the noblest of the arts? 3. This photograph is of a statue, in wood, one-third of the natural size, of a functionary of the Fourth Dynasty. Of this work of art Mariette justly remarks:—“Rien de plus frappant que cette image, en quelque chose vivante, d'un personnage mort il y a six mille ans. La tête surtout est saisissant de vérité.” 4. Photograph of a similar statue of a female, of the same period, of the same perfection of execution. 5. A seated statue in granite of a priest of the Fifth Dynasty. Not any of these physiognomies, if clothed in modern dress, would suggest that they were extra-European. The forehead is good in shape and size; the nose well-formed and proportioned, straight or slightly arched; mouth not more prominent than in the highest existing races; lips rather full in some. But in these less so than in the statues of the later Empire, and this feature may be matched in modern society. In our present palaeontological evidence of the antiquity of the human race, 7,000 years seems but a brief period to be allotted to the earliest, the oldest civilised and governed community. That a race with the physiognomical characters here exhibited should have risen so early to that high estate along the Nile accords with the unique blessedness of the soil and climate of Egypt, and with the high racial characters of the people flourishing under its antediluvian Pharaohs. This term, of course, is arbitrary, for Egyptian records tell nothing of a cataclysmal deluge. The land was never visited by other than its annual beneficent overflow. The deposits of that overflow, which would have been swept away out of the valley which the Nile has excavated by a diluvial wave, testify as strongly as the volcanos of Auvergne and the cataract of Niagara against the operation of any such geological dynamic at the Septuagintal date or any earlier. The instructive layers of the fluviatile deposit, like the leaves of a grand old book, in part read by Horner and Hekeyan Bey, have since been displayed throughout their extent by later engineering operations. They testify to as great a duration of time past for their successive

deposition as the mythical period of Manetho, anterior to his historical period, would require. No hint is given in that dim glance into the past of any exodus from other lands into Egypt. The individual who first raised the conscience of the primitive people in the Nile Valley, and who suffered, as is usual with such, from the evil ones whose violence and rapine he rebuked, was Autochthon; and, as is the wont in the rise and progress of a so benefited human race, he became at a later period a divinity, a judge, Osiris. The deeds of the great warrior Horus, similarly handed down and magnified, formed the basis of another demigod; but he likewise is Egyptian—no sign or hint of being borrowed elsewhere. The cranial, facial, and other physical characters of those Egyptians who lived and died nearest to the period when gods and demigods ceased in the flesh to govern Egypt yield no evidence on which I can rest that they were a colony of Asiatics. Evidence is still needed—at least, it is not yet forthcoming—to demonstrate the posteriority of Egyptian civilised man to any such advanced race in other lands. There are, doubtless, linguistic elements, as in that which recognises the worth of woman—her right to a vocal sign significant of sex—evidencing affinity with tongues called “Semitic.” But whether such affinity be due to migration from a hypothetical centre, Asiatic or European, whether to Egypt from any other land, or from Egypt to any other land, seems still to wait for solution. Permit me to trespass with the following remarks, which seem in some measure to bear upon this pregnant ethnological question. The Isthmus of Suez is geologically a recent bridge between Asia and Africa; it was completed at the newer miocene period. Recent, however, as this is in geology, it was sufficiently long ago to allow the forces originating species to establish such grade of distinction between large classes of animals dwelling respectively in the two seas which the Isthmus divides. No shell, no fish, for example, native of the Red Sea is met with in the Mediterranean, and reciprocally. Only the zoological mind can conceive, or attempt to grasp, the lapse of historical time so indicated. It is amply sufficient for the rise of such a race as the photographs exemplify. If Egyptian civilisation sprang from an Asiatic colony, whether at Squire's date or an earlier period, the route by land must have been by the Isthmus. We have evidence that Asiatic immigrants did take that route to Egypt, and, subduing the northern Autochthones, established themselves in the delta, and there founded their capitals, in some reigns Avaris, in most Tanis, both cities in the delta strategically chosen as against succeeding immigrants and invaders. Here is a condition which throws some light upon the question, and more directly, I think, than the linguistic evidence. The proved immigrants were Syro-Aramaean, migratory shepherd sheiks, typified by Lot and Abraham, with their fighting followers. They came in, at or after the Fourteenth Dynasty, about 2,500 years after Menes. Where were the capitals of the ancient Pharaohs? The earliest one might not be far from the country of the mythical or pre-historic race of Osiris, of Horus. Its site should indicate, as in the case of the Hyksos, the nearest point of contact with the Faderland, or Mother Country. Is it in the delta? By no means. Is it in Nubia? No. It is about midway between the northern and southern extremity of the oldest empire, at the locality to which the Greeks gave the name of Abydos, as they converted the Egyptian Tabu into their Boeotian Thebes. If Mariette Bey perseveres in his explorations of the mounds of Abydos which mark the site of ancient Thinis, the capital of the Pharaohs of the First and Second Dynasties, we may expect more light on that most ancient, and therefore most interesting, chapter in the Manethonian history of Egypt. Subsequently, and apparently in connexion with hydrostatic works regulating the bed of the Nile and recover-

ing land, at that time nearer to the sea than now, the capital is moved northward to within ten miles of the present Cairo, on the Libyan bank. It becomes the far-famed city of Memphis, with its great graveyards at Ghizeh and Saklara. After three dynasties have reigned there, the sixth goes further south than the primitive capital, and chooses the Isle of Elephantine. I confess that these large, patent, indisputable facts do not encourage the adoption of any hypothesis of immigration under present knowledge. I do not say that they establish Egypt to be the locality of the rise and progress of the earliest civilisation known in the world, but they justify an expectant attitude and beget a determination to persevering and continued research. Assuming that learned Rabbis best know what their ancient writers meant in penning their cosmogony, chronology, and history, and that we have just entered upon the year 5,635 of the world's age; and, furthermore, that the human species started afresh from the three sons of one Aramaean patriarch 2,000 years after, there arises the ethnological question in what period of time the varieties of such species and subjects of our studies were established. What is the earliest date, on scientific grounds, of their existence? Now here, as in most other scientific problems, we get the first help from Egypt. If I were to select from ancient history a founder of ethnological science, I should take Thothmes III., of the Eighteenth Dynasty. He was the first and greatest collector of ethnological specimens, unconscious, of course, of their relation to our science. The last of Mariette Bey's pregnant discoveries is a record (by Thothmes), in more detail than any other, of the countries, localities, and cities from which, in the course of his victorious campaigns, he obtained, for service, his examples of human races as at that date established. Thothmes may thus claim to be the oldest geographer as well as ethnologist. What were those races? In what degree had the human characters deviated from the Noachian or Syro-Aramaean type? This founder of ethnology shows us both the kinds and degrees of such variations. “How so?” you may ask. By coloured figures of his captives, suppliants, tribute-bearers. The walls of temples at Thebes are enriched with such frescoes. The British Museum possesses parts of one at least 3,000 years old, with its colours seemingly as fresh as when laid on. You may have contemplated that priceless ethnological testimony when you honoured us with your presence on Tuesday last. You would there see, first, the Egyptian subjects of Thothmes, his own people, bronzed and tanned, but in form and features repeating the ethnic characters in the contiguous magnificent sculptured representations of the monarch himself. Secondly, before him bow the Rotennou tributaries, with lighter complexion and hair, with a prominent hooked nose, with the full beard and other characters marking them as cognates of the Hyksos, of the Philistine or Palestine family, represented by modern Jews, and by the people whose features are preserved in our Assyrian sculptures. Thirdly, there is the unmistakeable typical negro—black skin, retreating forehead, flat squab nose, prominent thick lips, receding chin, legs slightly bowed, poor calf, long tendo Achilles, projecting heel, crisp woolly hair, short scanty beard. These bear the gold, ivory, leopard skins and other characteristic productions of the Soudan. You see the veritable progenitors of the slaving and slave-making tribes of late subjected to the wholesome discipline of Sir Samuel Baker. With this evidence of extreme varieties of mankind 1,500 years B.C., which subsequently have undergone little or no amount of change, the probability is great that in the time of Thothmes, but 3,000 years ago, there existed also red men in America, Maories in the Pacific, Mongols in China, Anios in Japan, Papuans in New Guinea, Tasmanians, not then extinct, nearer the Antarctic circle, Esquimaux at the opposite pole, and a wide dispersion of sub-varieties of the Negro race over
